THE REVIEW OF REVIEWS.

VOL. IX.

NEW YORK, JANUARY, 1894.

No. 1

THE PROGRESS OF THE WORLD.

THE two foremost topics of the day are the proposed changes in the tariff, and the relief of the unemployed. At no previous time in the history of the United States have so many people been out of work. Thousands of factories are closed altogether; and thousands of others are running with reduced forces. The depressed condition of trade has so lessened the volume of traffic that the railroads have been compelled to dismiss thousands of employees, while many roads have cut down the wages of the men retained. The curtailed purchasing power of the working people, due to the diminished proportions of the total wage fund, has affected merchants and middlemen of all classes, and they in turn have been compelled to reduce the number of their employees. The causes that have produced this condition of things are doubtless very complex. Probably the greatest cause has been the timidity and hesitancy of capital, on account of the protracted agitation of monetary and tariff questions. Evidently, the collapses of credit in Australia and Argentina, which compelled European investors to withdraw great quantities of capital from the United States, played their part in disturbing the business situation here. What is wanted now, more than all things else, is a cessation of tariff tinkering and currency tinkering for partisan ends. An afflicted nation would shed tears of gratitude if a non-partisan tariff commission and a non-partisan currency commission could be appointed to report a tariff measure by February 1, and a currency measure by April 1, both reports to be accepted unanimously by Congress and signed by the President,—with concurrent resolutions by Congress, by State legislatures, by Boards of Trade, and various other public bodies, to the effect that the two measures ought by common consent and understanding to remain substantially unchanged for ten years. The continual agitation of the tariff question in this country can be compared to nothing but the continual recurrence of revolutions in some South American countries. The existing partisan treatment of the question is as disastrous to business as a civil war, and it is absurd beyond the power of words to characterize it. Since the days of the endless metaphysical discussions of the schoolmen, there has been nothing

more fatuous and more hopelessly stupid than the attempt to reconcile the American tariff system either with *doctrinaire* protectionism or with *doctrinaire* free-trade. Practical men ought to be able to construct a workable tariff, and party zeal ought to borrow patriotism enough to let that tariff alone when it is constructed.

*The Wilson
Tariff
Revision.*

If a country is to have a general and highly complicated system of combined revenue and protective tariff imposts, the one clear maxim to be asserted over and over again concerning it is this: Change it only for the best of causes, and do not change it too frequently. And the reason for this maxim lies in a principle which we may express as follows: It is upon the whole easier for business to adjust itself to the tariff than for the tariff to adjust itself to business. Herein is to be found the chief objection to the new Wilson tariff measure. Like the McKinley measure, this also is a general and highly complicated system of combined revenue and protective tariff imposts. It is just as truly a protective tariff in all its principles and methods as any of its predecessors,—providing one is willing to admit that a fence remains a fence even when some of the top boards are knocked off. The Wilson bill in no sense involves a reversal of the plan of Republican tariffs; it is simply an elaborate revision of them. The practical difficulties met by the Wilson committee have been enormous. Nothing illustrates them better than the mere statement that within some two weeks after Mr. Wilson and his Democratic colleagues had finished and announced their work, they made more than two hundred additional changes in it. Business had begun to adjust itself to the tariff of 1890. If the Wilson bill is adopted,—as, after much discussion and amending, it is likely to be,—business must begin some months hence to shape itself to the altered schedules, with no warrant for a feeling of permanence and security. For, if the Republicans should be returned to power in 1896, they would probably rebuild the tariff fence in a different enough way to require general readjustments once more. Would it not have been in better keeping with announced

HON. WILLIAM L. WILSON, OF WEST VIRGINIA.
(Chairman of the Ways and Means Committee.)

Democratic principles if the Wilson bill had been framed upon more permanent and radical lines, with a view to a material change of policy several years hence? What possible objection could there be to a long notice? Some of the McKinley schedules were arranged to go into effect several years after the bill was adopted. It would be entirely feasible for Congress to declare that the new tariff would go into operation in 1895; making the date exactly five years after the McKinley act took effect. This would serve at least three good purposes. It would, first, enable the Democrats to prepare a measure much more faithfully in accord with their platform; second, it would relieve the existing uncertainty that paralyzes industrial activities, and, third, it would form a valuable precedent against rapid and haphazard tariff changes. The country is in no haste for a myriad of puzzling and embarrassing changes of detail in the tariff schedules, while the main outlines of the system remain.

Why Not Wait Until the Year 1900? If the Democrats had the statesmanship to pass a measure absolutely discarding every vestige of the protective system, and substituting a clear, simple, unmistakable plan of national taxation for revenue only, fixing January 1, 1900, as the time for this new policy to take effect, and agreeing to let the McKinley law

alone until that date, the country would be satisfied. The six years would give trade and industry the necessary chance to prepare deliberately for the change, and the transition would not be violent when it came. The free-trade ideal, which the Democrats espoused with such enthusiasm at Chicago, would by this means be ushered in completely and triumphantly in a short period. But, in our candid opinion, the plans now decided upon by the Wilson committee, far from doing anything at all towards promoting the transfer from a protective to a purely revenue policy, will have just the opposite effect by provoking a reaction that will restore the Republicans and perpetuate the Republican tariff policy. Resumption of specie payment was accomplished by the simple and obvious plan of announcing a date far enough ahead to allow the country to accommodate itself to the approaching fact. The question to-day is not whether the Wilson bill is better than the McKinley bill, but whether it is worth while to further disturb business by substituting one makeshift policy for another. Why not tolerate the existing makeshift, which has the advantage of being a known quantity, upon the understanding that in the year 1900 we shall enter upon an era of free trade?

Relieving the Unemployed. The principal communities of the United States are entering upon the business of providing relief for the unemployed with a thoroughness of purpose, and a practical wisdom as

MISS CLARA BARTON, OF THE "RED CROSS."

to measures, such as have never been known before. Elsewhere in this issue we have given several pages to a statement of the measures adopted in a number of our cities. Fortunately, the absurd theory that it is none of the business of municipal or other governments to recognize or alleviate exceptional social distress, has very little influence left. It is the plain duty of organized society to use its superior facilities for the benefit of the community at times when individuals are unequal to the situation. The winter of business disaster, when hundreds of thousands of honest men are out of work, is exactly the winter when public employment ought to be extended for the making of all sorts of desirable improvements. This is not dangerous socialism, but rather it is the clearest sort of business sense. Every town and county can at once relieve the unemployed, lessen the burdens and evils of public and private alms-giving, and make an excellent investment for itself, by going extensively into the business of improving the roads and streets. Of course, in large areas of country the cold weather and snow prevent new road making at this season. But even in these regions some profitable method can be devised for the employment at low wages of honest men out of work. It is pleasant to note the fact that in New York many men and women are engaged, under direction of the East Side Relief Association, in making clothing for the sufferers from the autumnal coastwise floods in South Carolina. Miss Clara Barton and her fellow-workers of the Red Cross Society are doing noble service for the relief of the frightful suffering that has ensued in consequence of the unprecedented storms that devastated that coast, and holiday offerings should be showered upon the work. It is unfortunate that Congress should have failed to make an appropriation for so exceptional a case as that of these South Carolina sufferers. Dr. Washington Gladden of Columbus has at our request set forth in this number of the REVIEW the sound principles upon which relief in our towns and cities ought to be based. He writes from a great fund of practical experience and scientific knowledge.

*A Triumph
of State
Conciliation.*

The strike on the Lehigh railroad was terminated, fortunately, early in December. The officers of the company immediately proclaimed that it was settled without their concession at any points. So far as we can understand, however, the strikers won a substantial victory. It was a deplorable thing that the employees of the railroad should have gone out on strike at a time when so many hundreds of thousands of workmen are involuntarily idle through the paralysis of industry. But it should be understood that such conservative bodies as the Locomotive Engineers, the Locomotive Firemen, and the other railway orders and brotherhoods are not accustomed, through their highest authorities, to sanction and conduct a strike, unless there are good grounds for it. These men do

not enjoy strikes. We are inclined to believe that the moral responsibility for this particular trouble rests with the officers of the Lehigh road. Agreements which had been made with the men months ago, and which ordinary good faith required should be kept, were disregarded by the company; and representative committees abundantly entitled to a hearing were refused an opportunity to present their case. The State Arbitration Boards of New York and New Jersey intervened to effect a conciliation, and succeeded in persuading the officers of the road to honor the rules and agreements of last August; to listen hereafter to grievance committees, and to take back

From a photograph by Doremus.

HON. J. P. McDONALD,

President New Jersey State Board of Mediation and Arbitration.

the strikers as rapidly as possible without prejudice on account of their strike. Just why these officials could not have acted with ordinary courtesy and tact at the outset, and met with frankness a set of employees whose position was a fairly reasonable one,—is a question they should be compelled to answer to the stockholders of the road. Moreover, it is a question that a discommoded public has an equally good right to ask. High praise is due to the Chairmen of the two Arbitration Boards for their efficient interposition in behalf of all interests. This case well illustrates the value of conciliation and arbitration as principles. But the law should go further and in some manner, under specified conditions, compel insolent railway corporations to arbitrate labor troubles.

End of the
English
Coal War.

Thus the good offices of the State, through its official representatives, have ended what threatened to be a very disastrous strike. In this connection it is worth while to give a *résumé* of the circumstances under which, in like manner, the good offices of the English government brought to a conclusion the recent coal strike. After a civil war of sixteen weeks' duration, peace reigns throughout coal-getting England. The settlement was most welcome, but even more satisfactory was the final method of settlement. The closing stages of what has proved to be one of the greatest industrial struggles of the generation need to be stated with some detail. The first attempt to put a stop to the strife ended in failure. Representatives of miners and mine-owners met only to part without achieving agreement. The masters proposed the formation of a Board of Conciliation to decide the rate of wages, the immediate resumption of work by the men at a reduction of fifteen per cent., and the payment of this fifteen per cent. into a bank, pending the decision of the Board, to be made over to the men or to the masters as the Board should decide. The miners agreed to the formation of a Conciliation Board, and to its fixing the wages to be paid after April 1 next, but insisted that in the interim work should be resumed at the old rate of wages, and that the Board should be precluded from making a greater reduction than that of ten per cent. Thus the dispute had narrowed. The negotiable limits were now, on the one side, the coal-owners' fifteen per cent. forthwith, and on the other, the miners' ten per cent. from April 1. But neither party would yield the intervening five months and five per cent. The deadlock remained as grim as ever. Winter was coming on. The area of dominant hunger and cold spread far beyond the mining dis-

Chairman New York State Board of Mediation and
Arbitration.

tricts. The enormous rise in the price of coal meant misery to the poor everywhere, and the scarcity of fuel involved general dislocation of national industry. For nine days the outlook was very black.

The "Good Offices"
of
the Government.

Then, "at last, though late," government awoke to a sense of its functions. The primary duty of government is, after all, not to win partisan triumphs over fellow-citizens, but to maintain civil peace and to protect the nation as a whole from being sacrificed to private cupidity or stupidity. If two men try to settle their quarrel by the help of bludgeons, the State intervenes at once; but a conflict directly involving hundreds of thousands of citizens, and waged with the deadly weapons of starvation and resolute inaction, constitutes a much more serious breach of social order. Long before a privateer had inflicted on the national commerce an infinitesimal proportion of the damage which has resulted to it from this Coal War, the government cruisers would have been on her track. But a third of a year of intense national suffering must elapse before either government or people are ready to allow the State to interpose as industrial peacemaker. However, "better late than never." Mr. Gladstone's letter caught the psychological if not the logical moment. His wisely-worded proffer of Lord Rosebery's good offices, not as umpire or arbitrator, but simply as friendly host and presiding mediator, evoked general and enthusiastic approval. The Miners' Federation and the Federated Coal-owners

promptly acceded to an "invitation," which virtually embodied a national command. The conference at the Foreign Office was as fortunate in issue as in inception. A single day under government influence sufficed to effect what had been fruitlessly attempted in a long series of local and municipal negotiations.

MR. J. R. SOVEREIGN.

New Master-Workman. Knights of Labor

*The Rosebery
Settlement.*

The agreement arrived at is marked by mutual concession. The miners won the immediate and manifest victory of resuming work at the old rate of wages, pending the decision of the Board of Conciliation. But the men conceded that the Board's decision should take effect from February 1, and not, as they had urged, from April 1. The masters, that is, yielded two-and-a-half months, the men only two months, of the period in dispute. The balance of victory on the side of the men thus amounts, when measured in time, to barely half a month. On the other hand, the men gave up what had been declared to be the very backbone of their contention, the prescribing to the Board of a minimum wage. There is not a word about the minimum wage in the Rosebery settlement. Its terms leave the Board free to settle the miners' wage without predetermined limit, either upward or downward. No doubt the stand which the miners have made for what they take to be "the living wage" will have its moral influence on the deliberations of the Board; but "the living wage" has found no express acknowledgment in the terms of the treaty.

*Arbitration
Victorious
at Last.*

The result is a twofold triumph. It is a triumph of the principle of arbitration. The fourteen representatives from each side in selecting a neutral chairman virtually appoint an arbitrator. It is a triumph of the further principle that the promotion of industrial peace is one of the

duties of the State. The possible nomination of chairman by the Speaker is a picturesque reminder of the fact that the State is not less interested in maintaining order amid the economic than among the political disputes of the nation. The precedent is certain to be largely followed. Already trade organizations have begun to ask for its systematic adoption by the Labor department. Some day, the Coal War of 1893 will seem as much a piece of civil barbarism as the Wars of the Roses. How largely popular sympathy has gone with the miners may be inferred from the amounts which have been subscribed for their relief. The *Daily Chronicle* alone has won from its readers more than eighteen thousand pounds.

*American
Labor
Organizations.*

The month has been marked, in "labor circles," by the annual meetings of the Knights of Labor and of the American Federation of Labor. The Knights stand for the principle of labor organization regardless of trade lines, and include unskilled workmen. They profess to stand for the general interests of the wage-earning classes, as against unequal legislation or harmful aggression on the part of capitalistic monopolies or combinations. Mr. Terence V. Powderly, so long the able and conscientious leader of the Knights, was deposed from the position of "Master Workman" at this meeting, and his place was filled by the election of Mr. J. R. Sovereign, of Iowa, upon whose abilities and policies it will be wise to defer judgment for a time. Mr. Sovereign's speeches are more inflamma-

MR. TERENCE V. POWDERLY.

tory than were Mr. Powderly's : but practical responsibility may sober him into something like conservatism. The Federation of Labor is, as its name implies, a combination of trades unions for general objects. It has been a strong and successful organization under the presidency of Mr. Samuel Gompers, gaining in membership and prosperity of late years, while the Knights have declined. The Chicago meeting of the Federation did less than was anticipated towards formulating a practical policy for the relief of the unemployed.

*The Status of
the Hawaiian
Question.*

The news from Hawaii has confirmed all our previous impressions as to the firm position of the Provisional Government. President Cleveland and Mr. Gresham could hardly have had a correct understanding of the situation ; or they would not have attempted a task so hopelessly Quixotic as the restoration of the discredited Liliuokalani. History does not record any revolution for

From a photograph by C. M. Bell, Washington, D. C.

SENATOR HOAR, OF MASSACHUSETTS.

Member of the Foreign Affairs Committee.

the setting aside of an unacceptable ruler that was more strongly supported by the responsible and dominating elements of the community than this Hawaiian revolution. When the Executive department of our government deliberately enters upon a secret policy in a matter that properly concerns Congress and the whole country, it is to be assumed that criticism is expected. Both Houses of Congress called upon the President for complete papers, and Senator Hoar introduced a new phase of the discussion early

in December by asking the Senate to pass a resolution calling upon the President to explain Mr. Blount's mission. It will be remembered that Mr. Blount was sent to Hawaii to assume functions not recognized by our laws, and that his appointment was never submitted to the Senate for confirmation. There can be little doubt that the Administration committed a serious, though not an intentional error in taking this course,—an error afterwards practically acknowledged and partially rectified by making Mr. Blount minister to Hawaii. But this error was not to be compared with that of the deliberate attempt to overthrow the existing Hawaiian government and to establish a monarchy in the islands, placing the ex-Queen upon a throne to be bolstered up by the American republic,—against the protests of the American colony, which in fact constitutes the weighty and significant element in the ownership and civilized life of Hawaii. It is true that Mr. Cleveland, Mr. Gresham and Mr. Blount declare the revolution to have been unduly aided by our minister, Mr. Stevens. But even if this were a fact,—and the preponderance of credible testimony is quite against such a theory,—it is difficult to follow the logic which led our Administration to think that it must virtually make war against the existing government. This Administration, while professing its abhorrence of what it deemed Minister Stevens' interference in the internal affairs of Hawaii, had itself proceeded to interfere on its own account, and to an extent quite unheard of before. Mr. Blount and Minister Willis had assumed something like autocratic power in the Islands ; and the Administration had been conducting inquiries into their affairs in a manner quite incompatible with its announced theory of our proper relations with a foreign country.

*Mistakes
of the
Administration.*

So far as the United States are now concerned, Hawaii has a firm government under President Dole and his associates. That government negotiated a treaty of annexation with our government under President Harrison. The treaty was pending in the Senate when Mr. Cleveland came into office. He withdrew it from the Senate before it had been acted upon, and he informed the Hawaiian government that annexation was rejected by the United States. This should have ended the Hawaiian question, so far as Mr. Cleveland was concerned. His subsequent disposition to concern himself with the internal affairs of Hawaii appears irrelevant. His rejection of the overtures for annexation leaves the Hawaiian government perfectly free,—unless we use or threaten force to restrain that freedom,—to enter into especial relations with the British or any other government. The spirit shown by the Hawaiian authorities is wholly commendable. They have announced their purpose to resist hostile attempts to dispossess them. Mr. Thurston, who has so ably represented the Hawaiian government at Washington, returned to Honolulu in the middle of December to aid and advise President Dole. In all candor let us say that the withdrawal

of the annexation treaty was a serious enough mistake, and that the proposed subsequent overthrow of President Dole and restoration of Liliuokalani, in violation of every principle of international law, would, if consummated, have been a dark blot upon our history. Nobody for a moment doubts the absolute rectitude of Mr. Cleveland's intentions in all this mismanaged business. But he has clearly suffered from the misfortune of bad counsel. Mr. Willis, of course, found it practically impossible, when he reached Honolulu, to carry out the policy of overthrow and restoration that had been prepared for him. The Queen herself was not ready to agree to the policy except with guarantees that the United States would permanently interfere to prevent the Hawaiians from deposing her again and governing themselves as they might prefer. The impossibility of the programme originally arranged for Mr. Willis of course increased with every day of delay after its main features became known; so that few things in the realm of the world's politics are now so improbable as that Liliuokalani will ever again sit upon a throne. Meanwhile, Mr. Carter and other Hawaiians have replied to Mr. Blount's report in a fashion that leaves it sadly discredited. Mr. Cleveland's long message to Congress on December 18, transmitting the papers and correspondence that had been asked for, did not in any way change the conception of the situation that had already been formed in the public mind.

*Our Foreign
Service and the
Spoils System.*

Mr. Cleveland has been in the White House ten months, and the quadrennial making of an almost entire new American diplomatic and consular service is practically completed. A vast amount of seasoned and valuable timber has been deliberately discarded, in order to make place for a like amount of new material. It should be distinctly understood that in very few cases are men dismissed from our foreign service for the sake of improving the service. Almost invariably they are dismissed because the appointing authorities wish to give the posts away to other men, not in order to promote public interests, but to serve private and personal interests. The subject in all its bearings has had a peculiarly striking illustration in the case of the appointment of Mr. James J. Van Alen as minister to Italy. It is conceded by every one that Mr. Van Alen's selection by Mr. Cleveland grew primarily out of his having contributed a large sum of money—from \$30,000 to \$50,000—to the campaign fund used in Mr. Cleveland's election. It is on the other hand conceded quite generally that Mr. Cleveland did not appoint Mr. Van Alen until after he had satisfied himself that this gentleman could fill the post respectably. The appointment was severely criticised in the Senate, and was only confirmed after much delay. The press of the country had also very widely condemned it. To the surprise of the country, Mr. Van Alen declined the place after he had been confirmed, holding that he could not take it under such a storm of criticism. He

defended himself with the plea that as a rich man it was not a remarkable thing for him to give so much money to the campaign fund, and that aid to the Democratic cause in that form was just as legitimate as aid in any other form. The President urged Mr. Van Alen to reconsider and accept the post; but the appointee remained firm in his declination.

MR. HENRY WHITE.

*Mr. Henry White's
Case as an
Instance*

There is in fact some difference between giving offices to men widely known because they are occupied with public affairs, and who aid their party's cause with voice and pen, and parceling them out to the private rich men who give money to campaign funds. Every one can feel the difference, no matter what logic is used to obscure so real a distinction. But in the light of the soundest principles, even such a difference is hardly worth noticing. The offices do not exist to reward party or personal services of any kind. They belong to the nation, and ought to be filled solely upon the simple, plain principle of promoting the nation's welfare. With all respect to Mr. Van Alen, it is inconceivable that he was the one available person best qualified to represent the United States at Rome. If it was necessary for any reason to relegate to private life the minister who was serving us at Rome when Mr. Cleveland came into power, it does not follow that trained men should be left out

of question in finding a successor. For instance, this Administration has seen fit to remove Mr. Henry White from the position of First Secretary of Legation at London. Mr. White has held the office a long time and has filled it most faithfully and admirably. If Mr. Bayard, who has succeeded Mr. Lincoln as our Ambassador, preferred to have Mr. Roosevelt try his hand at the desk of the First Secretary, it was entirely right that the change should be made in the London office. But if Mr. White had been connected with the diplomatic service of any other government on earth except ours, he would have been transferred and promoted. Why should he not have been sent to Rome as Ambassador? His dismissal from the public service is a disgrace and an outrage. The emphasis has been put at the wrong place by the critics of Mr. Van Alen's appointment. It is in the exercise of the removing power, rather than in that of the appointing power, that the offense chiefly lies. In the removal of Henry White, the Administration virtually serves notice on every young American of talent, industry and ambition, to the effect that trained ability is not wanted in our diplomatic service, and that the idea of finding a career in this branch of public employment is not to be entertained for an instant.

*Need of
an Expert
Service.*

Nothing would be easier, with the men now available, than the speedy development of an American consular and diplomatic service, wholly removed from politics and personal favoritism, that would be at once a source of credit and of great benefit to the country. There is so much of importance for our consuls, especially, to do at the principal foreign posts, that it is nothing less than a fraud upon our commercial interests and our whole people for the recurring administrations at Washington to use these places as personal and party spoils. If the people really understood the enormity of this wrong they would not endure it. President Cleveland's course, it should be said, in dealing with the foreign service, is not essentially worse than that of President Harrison. Neither of these Presidents has had any personal liking for the spoils system. It is fair to assert that both of them would have been delighted to let the diplomatic and consular service alone, making changes only for good reasons. But they were not able to resist the office-seeking pressure, and the foreign posts afford a comparatively easy opportunity to reward friends and satisfy the imperious demands of party henchmen. The writer made the round of various European and Asiatic consulates at the time when in 1889 Mr. Harrison and Mr. Blaine were "cutting off the heads" of the Democratic incumbents who had succeeded the men that Mr. Cleveland and Mr. Bayard decapitated in 1885. It happens that again in 1893 he visited a number of European consulates and witnessed the effects of another "clean sweep." Almost invariably he found that four years of service had given an official enough training to make him useful. Many of the consuls rudely displaced by Mr. Harrison were rendering splendid

service, were absolutely free from any display of "offensive partisanship," and ought by every rule of good business sense, of fair play and of public and private morality, to have been retained. To some of them the recall was a pathetic hardship. The situation was not different in the year just ended. Many difficult investigations had been committed to our consuls, having to do with trade and commerce, with agriculture, with public improvements, with municipal government, with emigration, with pauperism, with the public health, and with various other topics. A fine *morale* had been developed, for the most part, and the service had begun in the last year of the Harrison Administration to show signs of a commendable average efficiency. But a majority of the voters of the United States were opposed to the McKinley tariff; and therefore hundreds of our agents in all foreign countries must be discharged, and the whole service must be reduced to the kindergarten stage once more, to the serious detriment of every permanent interest that is served by a regular, experienced body of foreign representatives. It is a state of affairs that calls for righteous wrath. It would not appear advisable to put the diplomatic and consular service upon the same basis as the army and navy; but there ought to be promotions within the ranks, and every presumption ought to be against the dismissal of a distinctly valuable officer who wishes to remain in the service.

*Civil Service
Reform.—
Its Progress.*

The report of the Civil Service Commission shows that in some respects, at least, the country is making progress in the direction of a businesslike management of its affairs. Under the last Administration, the railway mail clerks were exempted from the domain of the spoilsman's axe. All vacancies must now be filled on the examination and merit system. Moreover, this system has been extended throughout the free delivery post-offices of the country. Heretofore it applied only to those offices which employed as many as fifty clerks. There is a crying need for its application in several other departments. For example, we have within a few days received a letter from the Superintendent of an Indian Training School in the far West, informing us of his discharge to make place for a man from the Southeastern State of——. The discharged official was a successful and honored city Superintendent of Schools in the West before he accepted the charge of an Indian school. His qualifications were admirable. He was in no sense a politician, but was a practical educator. He is thrown out of employment at a time of the year when an educational man cannot hope to obtain a position; and the sole reason would seem to be that the Hon. Hoke Smith, Secretary of the Interior, wishes to find a job for a friend of his, or for a friend's friend. It would be far better,—if the Secretary's friends have to be cared for at public expense,—to make several hundreds of nominal offices, to be entitled, for example, Commissionerships to the Planets and Other Heavenly Bodies, allowing each Cabinet

Secretary a hundred such appointments, and each Bureau Chief twenty-five. The country could afford all these extra salaries, if thereby it could protect the Indian schools, the consulates, and other purely business or professional services from demoralization by the spoilsmen.

MR. JOHN R. PROCTOR, OF KENTUCKY.
New Chairman Civil Service Commission.

*The Civil Service
Act and Its
Administrators.*

The Civil Service act, which brings under the merit system some ten thousand clerks in public offices at Washington and also protects the employees of the principal post-offices and custom houses of the country, was adopted by Congress soon after the spoils system had, indirectly, led to the assassination of President Garfield. It ought by this time to have been extended, by successive amendments, to the protection of scores of thousands of public servants whose places are still at the mercy of the spoilsmen. But at least its worth is now fully realized, its experimental stages have been outlived, and it has given birth to a reform system that will grow in spite of all opposition. Its administration is in the hands of a commission of three members representing both great parties. Messrs. Lyman and Theodore Roosevelt continue to hold their positions. They have served for years with eminent fairness, and with zeal for a public service conducted on business principles, rather than with party bias. Until very recently Mr. Geo. D. Johnston has been associated with them, but his views have been different enough to interfere with harmonious action, and President Cleveland has now

appointed in his place Mr. John R. Proctor, of Kentucky. This gentleman was formerly State Geologist, and his record shows him to be sufficiently free from the spoils view of public office to make an impartial commissioner, while having the requisite force and firmness. The commission as at present constituted deserves the respect and confidence of the country. Mr. Lyman may be said to be a specialist in the organization and working of a merit system of appointment to office, rather than a representative of any political body, while Mr. Roosevelt and Mr. Proctor respectively belong to the best element of the Republican and Democratic parties.

*A New
Abolition
Movement.*

The moment is auspicious for a people's uprising to secure the total abolition of the spoils system. Every man in the country, rich or poor, is to some extent defrauded and swindled by the system which uses public offices, whether local or national, as rewards for party services and as spoils to be distributed by professional politicians. The spoils system is no necessary appendage of strong party organization or of effective political activity. Political life is just as intense in England, France, and other countries as in the United States, but the success of one party or the other in those countries does not involve any change in the office-holding ranks. In order to consolidate American sentiment in favor of this righteous cause, there is just now forming a new National League for the complete abolition of the spoils system. The following is a reduced *fac-simile* of the card issued by the new organization:

THE ANTI-SPOILS LEAGUE.

CARL SCHURZ, *President*, WILLIAM POTTS, *Secretary*, SILAS W BURT, *Treasurer*.
OFFICE, 54 WILLIAM ST., NEW YORK.

We hereby declare ourselves in favor of the complete abolition of the Spoils System from the public service,—believing that system to be unjust, undemocratic, injurious to political parties, fruitful of corruption, a burden to legislative and executive officers, and in every way opposed to the principles of good government.

We call upon all in authority to extend to the utmost the operation of the present reform laws; and by additional legislation, to carry the benefits of the Merit System to the farthest possible limits under our national, state and municipal governments.

Name _____

Address _____

It is desired to obtain as large a number of adherents as possible for the above declaration and demand. The signer of this statement becomes a member of the League. Membership involves no payment of dues, although contributions for the promotion of the cause will be welcomed. It should be stated that the movement is under the general auspices of the National Civil Service Reform League. It ought to find hearty support in every community in the land.

*Free
Kindergartens
in New York.*

In the midst of much agitation and of various useful activities for the improvement of the social condition of the frightfully congested population of New York

City, there has gone quietly forward an educational reform destined, in all probability, to effect more for the future well-being of the metropolis than any other social agency whatsoever. We refer to the movement for the establishment of free kindergartens. The president of the New York Kindergarten Association is Mr. Richard Watson Gilder. In his recent address at the annual meeting of the society he made the following statement: "The association has had four years of active existence. In the report of 1891 two kindergartens are recorded as under its charge; in 1892, three; in the report for 1893, eleven; and now there are fourteen in all; while the Board of Education of the city of New York, acting in sympathy with our movement, has incorporated the kindergarten into the system of municipal instruction." The real object, as Mr. Gilder has more than once explained, of the New York Kindergarten Association has been to show concretely that the kindergarten should become an inherent and universal part of the public school system not only of New York but of every other city and town in the country. In 1892 the New York School Board, by a vote of eighteen to one, decided to make a beginning with the kindergarten system, and thus far the kindergartens have been established in seven of the city's schools. President Sanger states that an increased appropriation may be confidently expected for next year, so that at its close there will be in successful operation free kindergartens in fifteen of the primary schools. This is a very small number, but it means unquestionably that New York is now committed to the system and will rapidly extend it in the future. There have been and are, it is needless to say, many excellent kindergarten classes under the auspices of churches and charitable organizations in addition to those provided by the New York Kindergarten Association and the public schools. The founder of this association was Mr. Daniel S. Remsen, whose unremitting and unselfish efforts in behalf of the work are worthy of the highest praise, and who holds the office of corresponding secretary. Mr. Gilder has for several years served with enthusiasm and energy as president of the society, and Mrs. Grover Cleveland, Mrs. Kate Douglas Wiggin, and Mr. Hamilton W. Mabie are vice-presidents. The board of managers and the various committees are composed of ladies and gentlemen to whom also much credit is due. Other cities began earlier than New York to create a widespread public sentiment in favor of kindergartens for the children of the people; but it is gratifying to note that New York is likely a few years hence to have removed much of the reproach under which it has heretofore stood for its neglect of the little ones.

Canada's Adoption of Kindergartens.

Meanwhile, it should stimulate American cities to renewed efforts to learn of the comparatively great zeal and success with which the Canadian cities have been engrafting the kindergarten work upon their public schools. Throughout the province of Ontario espe-

cially the kindergarten system has been very generally adopted. For instance, the city of Toronto has a kindergarten department in every one of its thirty or forty public school buildings, and the system is well supervised and firmly planted in that enterprising community. Hamilton, also, is especially entitled to feel pride in the thoroughness with which the kindergarten has been established throughout its public schools. It has some seventeen kindergarten classes, and one-tenth of the total membership of the public school system is found in the kindergarten grade. The town of London has eight kindergartens connected with its public schools, and proposes to extend the system still further. We have received a

MR. DANIEL S. REMSEN.
Secretary N. Y. Kindergarten Association.

very satisfactory account of the system in that community. The kindergarten department of the public schools of Ottawa is of comparatively recent establishment, but there are now five kindergartens under the care of the public school board, and the system will doubtless have very early extension. It should be remembered that these Canadian towns are neither large nor rich when compared with a long list of American places. In many things the municipalities of Ontario are decidedly in advance of those of the United States; and the same observation would apply to a number of Canadian towns in other provinces.

Reform in Municipal Service.

It is gratifying to note the growing strength of the demand for improved, businesslike administration in our cities. Mr. Schieren, the newly chosen Mayor of Brooklyn, is

MAYOR SCHIEREN. OF BROOKLYN.

winning universal commendation,—among all whose good opinion is worth having,—by disregarding politics altogether in his appointments. The Brooklyn charter makes the Mayor an autocrat. He chooses the heads of the principal executive departments; and, accordingly as he chooses well or badly, the city of Brooklyn will have good or bad government. When the Hon. Seth Low, now president of Columbia College, was Mayor, Brooklyn enjoyed a model government. Under Mr. Boody, the retiring Mayor, it has been shamefully misgoverned. For the period of Mayor Schieren's term it is to have a good administration, because the responsible heads of departments are known to be high-minded, public-spirited citizens, and as capable as they are well disposed. The people of Brooklyn arose in their might and defeated a corrupt ring of local bosses. The citizens of New York may now have the instructive object lesson, near at hand, of a great city administered on civil-service-reform principles.

*New York City
and
Its Politics.*

In New York City, although it was not the year for electing a Mayor, there were issues at the polls that presented some significant tests; and the evidences of reaction against Tammany Hall and of an awakening in favor of good government are very gratifying. The City Club, with its affiliated Good Government clubs, is showing itself to be a permanent centre of municipal reform influence and activity that can but avail very much in the end. Its members belong to all parties, but are pledged to the non-partisan principle in municipal affairs. Its secretary and energizing spirit is Mr. Edmond Kelly, and its president is the distinguished lawyer, Mr. James C. Carter. Probably nothing else of late has done so much to create a sentiment against

Tammany Hall as the persistent and terrific onslaughts of the Rev. Dr. Charles H. Parkhurst, who, in his capacity as President of the Society for the Prevention of Crime, has undertaken to demonstrate and to break up the long-existing system of paid police protection, under which all kinds of vice, disorder and criminal immorality have abnormally flourished in New York. No one can predict what permanent gains for private morality may result from Dr. Parkhurst's "crusade" against the Tammany police organization; but almost every thoughtful citizen has reached the conclusion that the shaking-up can but contribute handsomely to the causes of good government and public decency. Such sustained energy, such high courage, and, upon the whole, such discretion and tact as Dr. Parkhurst has shown, are not

From a copyrighted photograph by Sarony.

REV. DR. CHARLES H. PARKHURST.

often witnessed. His task has required the greater faith and courage because so very many of the best people have all along been too doubtful both as to his plan of operations and as to any valuable results to accrue, to lend even their unqualified encouragement. Dr. Parkhurst's agitation has convinced New York City that vice is regularly protected by Tammany and the police, for a large share in the profits. To have aroused public opinion in this fashion is a great achievement. There remains a great work to be done along other lines; but it now seems clear that this preliminary upheaval was necessary.

*Chicago
After the
Fair.*

As an outcome of the Fair, Chicago is to have a magnificent permanent art museum, towards which that merchant prince and distinguished citizen, Mr. Marshall Field, has contributed a million dollars, while other gifts have been poured into the desired fund like water. Chicago's men of wealth have set the world an im-

MR. MARSHALL FIELD.

pressive example by their unprecedented public spirit. The inevitable reaction after such an inflation of inhabitants and employment as the Fair produced will affect Chicago only temporarily. The municipal election of Tuesday, December 19, resulted in the choice of Mr. John P. Hopkins as successor to Carter Harrison.

*Utah's
Approaching
Statehood.*

One of the most noteworthy events of December was the passage through the House of Representatives, without a single dissenting vote, of the bill for the admission of the territory of Utah as a State. Utah had long ago reached the point in population and wealth which has generally been regarded as sufficient to entitle a territory to full-fledged membership in the Union. But Mormonism and its objectionable peculiarities have heretofore been regarded as so serious a disqualification that Utah's demand for admission has never been strongly supported in Congress. At length it is conceded on all hands that Mormon polygamy is a thing of the past, dead and buried beyond all danger of resurrection. It is also better understood now than it has been heretofore, that the Mormon population as a whole is made up of honest and thrifty people, before whom as American citizens there lies a worthy and an important future. It happens that both of the great political parties have strong hopes of being able

to secure ascendancy in the new State. In view of the unanimous action of the House it is safe to predict that neither the President nor the Senate will offer any serious obstacle to Utah's early achievement of Statehood. The fact that two United States Senators from Utah are to be expected in the early future gives interest to the statement that the Mormons as a class are very conservative on the financial question, and that they have always been disposed to favor the doctrine of a protective tariff. As to the proposals to admit New Mexico and Arizona also at this time, the argument is not so convincing. New Mexico has a larger population than many existing States had at the time of their admission, but its people are largely of Mexican origin, unacquainted with the English language and unfit as yet for the intelligent exercise of the duties of American citizenship. It would seem, moreover, that Arizona is hardly mature enough to justify admission.

*The Struggle
in Brazil.* The reason why the news concerning the so-called revolutionary war in Brazil is so vague and unsatisfactory can now be better explained than it could a few weeks ago. The simple fact is that the indefinite reports grow out of a wholly indefinite condition. Bishop Peterkin, of the Episcopal church, who has just returned from a tour of missionary inspection in Brazil, gives us a very considerable access of light upon the situation, when he asserts that there was absolutely no public sentiment one way or the other among the citizens of Rio Janeiro. There appeared to him to be a general understanding that the city was not to be bombarded or seriously molested. The contest lay chiefly between the army on the one hand and the navy on the other. The expulsion of the old emperor Dom Pedro and the overthrow of the monarchy was effected by the leaders of the army. Bishop Peterkin states as a significant fact that to-day twenty of the twenty-one governorships of the States which compose the federal republic of Brazil are held by officers of the regular Brazilian army. Nominally the people of the provinces elect their own governors freely. But as a matter of actual fact, the federal army exercises so undue an influence as to succeed, against the probable wishes of the people, in keeping in its own hands the administration of all the constituent States of Brazil. Peixoto, the President, it should be remembered, is himself a leading general of the Brazilian army. The whole country, therefore, has since the expulsion of the Emperor been taken possession of by the military. The long-standing revolution in the great Southern State of Rio Grande do Sul is said to be due chiefly to the fact that the people arose in organized revolt against a military governor, while Peixoto and the federal forces insisted upon sustaining that military executive in the exercise of authority over the province.

*Mello's
Prospects
and Claims.*

Originally, Admiral Mello, who leads the revolt of the navy against Peixoto, declared that his contention was for civilians in the civil offices, as against the military occupa-

tion of all important executive positions. Mello also claimed to be fighting for a policy that would lead to the pacification of the justly rebellious province of Rio Grande do Sul. It should be remembered that there is no well developed public opinion in the vast imperial territory of Brazil; that there is no real freedom of the press; that facilities for the distribution of news are imperfect and unreliable; and that there can therefore be no such thing as the existence of a clear and simultaneous public sentiment throughout the country. Bishop Peterkin came away with the impression that, all things considered, the balance of sentiment was probably in favor of Mello. If Peixoto's new ships, bought and fitted out at New York, should be successful against the very limited fleet controlled by Mello, the war would of necessity be at an end and Peixoto would be master of the situation. On the other hand, if Mello should succeed in destroying or disabling the "Nichteroy" and the vessels accompanying that ship, the Bishop was of opinion that Mello would quickly gain a footing on land and would stand a very good chance of obtaining control of the government. It is further interesting to learn from Bishop Peterkin that he did not, by any means, find that in the general consciousness among Brazilians Mello stood clearly for the restoration of the monarchy. If Dom Pedro's heir had been a son, the empire would in all probability have continued for many years to come. But Dom Pedro's daughter was married to a thoroughly unpopular European nobleman, and she herself was believed to be under the absolute control of the Jesuits;—whereas army leaders and practical men of affairs in Brazil seem for the most part to have adopted some form of positivism or rationalism, and to have assumed an attitude of decided hostility against any connection between church and state.

*Will There
be a Fight
at Sea?*

So much for the merits of the case. As a matter of course the immediate event most intently looked forward to, is the news of an encounter between Mello's ships and Peixoto's New York outfit. Strange to say, the nations of the earth, great and small, have spent not merely hundreds but thousands of millions of dollars within recent years in building modern vessels of war on new principles as to defensive armor and offensive armament, and yet we have not a single instance on record of two modern ships of war engaged in hostile encounter. England very indecently used some of her largest vessels to bombard the helpless city of Alexandria; but not one of the ships of her vast modern navy has ever fired a shot at a ship belonging to another power. It is no wonder then that the whole world is watching with intense interest for the news of a naval encounter somewhere off the coast of Brazil. For our part, we cannot regard as anything else than lamentable the fact that American officers and sailors, in the capacity of mere adventurers and mercenaries, have manned the ships bought with Peixoto's money.

*England's
Naval
Supremacy.*

One proof that the Imperial temper has not quite died out among the English is the unanimity with which all parties insist, at least in words, on the maintenance of naval supremacy. The approaching expiry of the Naval Defense act; the apprehensions aroused by the Franco-Russian alliance and the opening of French harbors in the Mediterranean to Russian men-of-war, together with the comparative weakness of England's fleet in those waters, have given rise to a vigorous agitation with a view to making the British Navy what it should be. The absolute necessity of maintaining the command of all the seas is admitted by men not generally suspected of Imperial enthusiasm. Mr. John Morley, speaking at Manchester, declared that England must maintain an "all-powerful" navy. Lord Charles Beresford requires as the minimum standard of efficiency a fleet one-third greater than any possible combination of two hostile fleets. At present England has sunk far below that point. To reach it will require an outlay of several million pounds. Mr. Gladstone at last seems ready to consent that the aspirations expressed by Lord Spencer on the one hand, and Mr. John Morley on the other, shall be fulfilled to the letter.

SIR ROBERT MORIER.

*Sir Robert
Morier.*

The death of Sir Robert Morier, who had for so many years represented Britain at St. Petersburg, is a great loss to the cause of European peace. Sir Robert Morier was trusted by the Czar more fully than any British Ambassador who has been sent to Russia since he came to the

throne. It will be most difficult to replace Sir Robert. Even if the best man were secured, he could not step at once into the position which his predecessor had won by years of honest, sturdy, straightforward diplomacy. The peace of the world depends on the Czar, and it is of supreme importance that the man who speaks for England in the Russian Court should have his confidence, and should be a man of transparent honesty and simple truthfulness. Sir Robert was anything but a diplomat in the usual sense of the term; he was often a very clumsy bull in a very crowded china shop; but he was a man of his word. He had brains enough to understand where the truth lay, and courage enough to speak plainly when occasion arose. The selection of his successor will be the most difficult and delicate task that has fallen to Lord Rosebery's lot since he became Foreign Minister. As to Sir Robert Morier personally, he was a man who alike

THE LATE PRINCE ALEXANDER.

for his qualities and for his defects left a very deep and lasting impression upon the minds of all his friends. The late Lord Derby said that Sir Robert had more knowledge of men and affairs in modern Europe in his little finger than all the rest of the diplomatic corps possessed in their combined heads. Sir Robert Morier had studied the transformation of modern

Europe from behind the scenes. He knew every one, had been everywhere, and could throw a flood of vivid light upon almost all the incidents of modern history. No dry light, or colorless light, by any means; for Sir Robert was a man of fierce antipathies and strong predilections. He was a Berserker of a man in some things. His language, when he let himself go, was something to remember rather than to repeat; but these idiosyncrasies added to the fascination of his discourse. Like many men of his type, he was a pessimist in Home Politics. Home Rule made him foam at the mouth; but he loved his country with a passionate devotion, and almost to the last he cherished hopes that he might be able to serve her in the Senate. He was a man bursting with information, and he inundated his chiefs with dispatches which were often too long for the patience of the Foreign Secretary, who as a rule does not care for encyclopedic knowledge served up in dispatches. Sir Robert was by nature a journalist rather than an diplomatist, and he very narrowly escaped being an editor instead of an ambassador. In St. Petersburg he recognized the opportunity his position afforded him of promoting the peace of the world and the overthrow of Prince Bismarck, and before he died he had the rare satisfaction of feeling that in both objects he had been completely successful. The same month which records the death of the Ambassador who had done so much to promote friendly feeling between Russia and England witnessed the decease of the brilliant young adventurer, Prince Alexander of Bulgaria, whose personal influence among British Royalty it was once feared might have involved this country in hostilities with the Czar.

*The
Employers'
Liability Bill.*

The Employers' Liability bill, in spite of obstruction, safely passed through all stages in the Commons. The chief interest of the debates centred in Mr. W. McLaren's amendment to allow employers and employed, under carefully specified conditions, the liberty of "contracting out." It was stated that the vast majority of the workmen now covered by the mutual insurance arrangements of certain great railway and other companies had voted or petitioned for exemption from the proposed law. But the Commons held, by 236 votes to 217, that citizens, however much they desire to do so, may not relieve the State of its obligation to secure for them that compensation for injury and that consequent protection from injury which the bill has in view. A great landlord undertaking, with the consent of his tenants, to defend their life and property from aggression might as logically expect to contract himself and his estates out of the jurisdiction of the police. Mr. Chamberlain got back from America just in time to speak against the bill on its third reading. His speech will possibly be best remembered by its ingenuous allusion to "his Radical days" and the explanatory confession, "I was a Radical once." It remains to be seen whether the covert obstruction of his present allies will prevent the passage through the Commons of the other measure down

for this winter's work,—the Parish Councils bill. The House of Lords, as was to have been expected, has refused to pass the Employers' Liability measure without first inserting the objectionable contracting clause.

*English Topics
In General.*

The House of Commons, meanwhile, has been working with tremendous energy, in the face of constant obstruction, to pass at the end of the longest parliamentary year on record the Parish Councils measure. It is a vast code of local government, in completion of the preliminary outline contained in the County Councils bill of four years ago. The condition of the unemployed in England is frightful this winter. But the local authorities, and the local authorities alone, are, by Mr. Gladstone's reply to Mr. Keir Hardie, left to deal with this evermore obtrusive problem. The national Government is to limit itself to issuing circulars and Blue-books. In November a Blue-book was published by the Labor Department of the Board of Trade containing much valuable information about methods for dealing with the unemployed, but practically going no further than negative or suspensive criticism; and at the end of the month was promised a report on the same subject from the Labor Commission.

*The
Matabele
Trouble.*

The last reports as this record goes to the press announce grave disasters to the South African forces in pursuit of Lobengula and the Matabeles. This war between British South Africa and the stanchest and craftiest native ruler left in the Dark Continent has made a tremendous discussion in England, and has led to much wholly improper criticism of Prime Minister Cecil Rhodes at the very moment when he was entitled to confidence and forbearance. The end of this sad conflict will be awaited with keen anxiety.

*Affairs
In
Germany.*

The wants and woes of the workingman are the preoccupation of the hour in all the civilized world. The official statistics of the elections to the Reichstag, which was opened in Berlin on the 16th, showed that the Social Democrats had polled more votes than were cast for any other party, and had increased their total in three years by one-third of a million. The Social Democrats have also won further victories in the Berlin municipal elections. The German Emperor, with his genius for dramatic contrast, may hurry from opening the Diet, elected on a wide popular suffrage, to tell 12,000 soldiers freshly sworn, "You must have but one will, and that my will;" but all this parade of military autocracy fails to lay the menacing spectre of the Social Democracy. The dynamite outrages have temporarily checked the boldness of socialistic utterance, but they have not really weakened the movement. Meanwhile, Chancellor von Caprivi has succeeded in clinching his new reciprocity treaties with Roumania, Servia and Spain. The excitement over the capture of French spies at Kiel has abated, the spies suffering nothing worse than temporary imprisonment in a fortress. To the world at large no news from Germany is more interesting than that which tells of the great new fortified camp established by the German government at Malmedy, on the Belgian frontier. Belgium is naturally alarmed and indignant.

*The
Austrian
Crisis.*

The crisis brought about by Count Taaffe's valiant endeavor to enfranchise the Austrian workingmen ended in the formation of a coalition Ministry composed of Conservatives, German Liberals and Poles, under Prince Windischgrätz, as Premier; but even they have been compelled to admit that an extension of the franchise is inevitable, and to prepare bills accordingly. The

Royal assent to the Hungarian Civil Marriage bill marks the breaking of another bar to progress in the bi-partite realm.

*The Fall of
the French
Ministry.*

The crisis in France supplies perhaps the most startling illustration of the power of the new Labor or Collectivist movement. The Chambers assembled on the 14th of November with a clear majority of 100 for the Moderate Republicans. Against their 325, the Socialists numbered only 50, Radicals and Socialists together only 185. The ministerial programme was announced on the 21st by M. Dupuy, and wore a strongly anti-Collectivist complexion. He "repudiated all doctrines claiming to substitute the impersonal tyranny of the State for individual initiative," and he would have nothing to do with a progressive income tax, separation of Church and State, or revision of the constitution. But the new leaven was at work in his own cabinet—M. Peytral, the Finance Minister, being wedded to the project of a progressive income tax—and the vigorous Radical criticism in the Chamber, coming on the top of the ministerial dissensions, led to the resignation of the ministers in a body, their majority in the Chamber notwithstanding. M. Spuller, a great friend of Gambetta, who is said not particularly to favor the Russian alliance, was asked to form a new ministry. Eventually, however, M. Casimir-Périer became Premier and Minister of Foreign Affairs, with M. Spuller as Minister of Public Instruction.

*The New
Cabinet.*

Another French cabinet is at the helm, and has now lived nearly a month. M. Casimir-Périer, who is Prime Minister and also in charge of the portfolio of Foreign Affairs, had been serving as President of the Chamber of Deputies; and he has now exchanged places with the late Premier Dupuy. A few months ago the Panama scandals seemed to have left untainted almost no public men of first-rate ability. But the Republic is

stronger than ever, and the government is manned with men of force, character and experience. Dupuy retired from executive office with high honor and general esteem, and there are no stains on the reputation of Casimir-Périer. In his cabinet are such men as M. Spuller, Minister of Public Instruction; M. Burdeau, Minister of Finance, and, notably, M. Raynal, Minister of the Interior. President Carnot's seven-year term is nearing its end, and this new year 1894 will witness a French presidential election.

PREMIER CASIMIR-PÉRIER, OF FRANCE.

Carnot is supposed to wish a second term, and both Constans and Casimir-Périer are regarded as aspirants for the high office. All are safe men, in whose hands French republican institutions would prosper.

*Greece
Gone
Bankrupt.*

There has been quite an epidemic of ministerial crises, Austria, Greece, Italy, France and Servia have all succumbed. Spain and Portugal have been threatened. The Greek Chamber was opened on November 8, with the announcement of a certain funding scheme as the only way of escape from financial collapse. Next day the Government was defeated by a majority of more than two to one, and the King, on receiving their resignations, called M. Tricoupis back to power. But not even the new Premier's abilities could cope with the situation. He has had to declare that Greece could no longer fulfill her foreign engagements, and desired therefore to come to "an honorable compromise with her creditors, offering them such terms as the state of the country would permit." The smallness of the Hellenic kingdom does not destroy the importance of the fact that in a continent overburdened with debt the precedent of national bankruptcy has been revived.

*Crisis in
Italy.*

Greece has fallen into the abyss of insolvency; Italy still reels on the brink. The assistance lent her by German financiers has only postponed the evil day, and an ex-Minister has gone so far as to suggest war as the only way out—a desperate plunge to bring the present tension to an end, which has long been apprehended. Even if the public honor of the Government was unscathed, the private honor of its members was not above suspicion. When the Chamber met on the 23d,

be seen what Signor Crispi, who was induced by Bismarck to bring Italy into this military combination with Germany and Austria, can now do to extricate his country from its resulting plight. President Cleveland on December 19 nominated Hon. Wayne MacVeigh Ambassador to Rome in place of Mr. Van Alen, who declined the post. England has sent there the Right Hon. Sir Clare Ford, G. C. B., in place of the late Lord Vivian.

*Dynamite in
the French
Chamber.*

The principal anarchist sensation of the year was caused by the explosion of a dynamite bomb in the French Chamber of Deputies on December 9. The audacious attempt at Paris is the gravest of all recent crimes in the name of social reconstruction. The bomb was thrown from the gallery of the Chamber by an Anarchist named Vaillant,—an artisan of considerable superficial intelligence, who has frequently been convicted of petty crime, and whose extreme socialistic views have apparently grown out of hostility to the virtues as well as the evils of the established order of things. Vaillant meant to kill Dupuy, who was occupying his new position of President of the Chamber, having been elected to that post on his retirement from the Premiership. But the course of the bomb was diverted by some one who caught Vaillant's arm; and the missile exploded against a cornice, wounding the thrower himself, together with some eighty others. Dupuy quieted the Chamber with a noteworthy exhibition of self-control, and business was speedily resumed. The first answer made by the Chamber to the fiendish conspirators who belong to the Anarchist party was to let it be known that public servants would go straight on with their duties; that if they were assassinated their places would be filled, and that the foundations of society would be strengthened rather than shaken by such cowardly assaults. The second answer was the adoption of measures for the much more thorough ferreting out of dynamite plots, and the more severe restraint of the socialist press. Every indication points to the probability of international co-operation to rid the world of this new class of criminals. Meanwhile the cause of peaceful socialism has been discredited and set back throughout all Europe; for unfortunately the dividing line between the socialism that seeks an orderly and lawful development of the industrial functions of the state and the revolutionary socialism that preaches destructive attacks upon government and private capital is not sharply drawn. If the Socialists have any real remedies to offer for social wrongs and grievances, they have at hand political and educational modes of propaganda that are all-sufficient.

*The New
Swiss
President.*

On December 14 Colonel Emil Frei was elected President of Switzerland. This item of foreign news has very properly been received with much interest and pleasure in the United States. Emil Frei came to the United States in 1860, at the age of twenty-two, as a young Swiss

SIGNOR CRISPI.

the report of the committee appointed to inquire into the charges revealed gave irregularities in the dealings of Ministers with the banks. The violent debate which ensued next day, and in which the Premier, Giollitti, was personally denounced, ended in the resignation of the Ministry. After four days' negotiation, Signor Zanardelli was intrusted with the formation of a new Cabinet. But Zanardelli (then President of the Chamber of Deputies) was unable to bring together a body of Ministers that the people's representatives would sustain. At length the King was compelled to summon Crispi from his retirement, and this experienced statesman formed a government which was completed on December 14. The new Cabinet is of rather non-partisan complexion, and its object is patriotic in the broadest sense. It will endeavor gradually to reduce the needless military burdens which have drained the Treasury, and to improve the relations between Italy and France, upon which Italian commercial prosperity is so dependent. Italy's membership in the Triple Alliance has been frightfully expensive and wholly unnatural. It remains to

scholar fresh from the best continental universities, his plan being to study American institutions. He was descended from a worthy line of Swiss public men; and with rare aptitudes for political science

EMIL FREI, PRESIDENT OF SWITZERLAND.

and public affairs, he turned naturally to America as an instructive field of inquiry. He was on the ground to witness the stirring events that immediately precipitated the war; and as soon as the call for troops was issued he registered his purpose to become a naturalized American citizen, and enlisted as a private soldier in an Illinois regiment. He served through

HON. MACKENZIE BOWELL.

the entire war with great courage, and came out with a Colonel's commission, which had been fairly earned. He returned at once to Switzerland and entered upon a public career of great usefulness and

activity. He was the leader in securing many social reforms, and the story of his political and journalistic life in Switzerland would be the recital of much that is creditable in the history of that republic during three decades. In 1882 he returned to the United States as Swiss Minister and served in that capacity at Washington until 1888. Since that time he has for a considerable period served as Vice-President of the Swiss Confederation. His promotion to the Presidency is a well-earned honor.

*Canada
and
Australasia.*

Canada has taken the initiative in the policy of establishing closer relations between herself and Australasia. The mission of Mr. Mackenzie Bowell, the Canadian Minister of Commerce, to the governments of the Australian colonies has evoked hearty response. As a result, a conference will, it is understood, shortly assemble in

HON. HUGH MUIR NELSON.

Canada to promote trade and to arrange for a cable between the two great colonial continents. Of the alternative routes proposed for this cable—the shorter crossing French territory and the longer touching British possessions only—the latter alone will be seriously considered. The electric link connecting the Dominion and the nascent Commonwealth is much too precious, from the Imperial point of view, to be exposed for the length of a single inch to the control and caprice of any foreign power. That Australians are not behind Canadians in the new enterprise is evident from the statement that Sir Thomas McIlwraith has yielded the premiership of Queensland to Mr. Muir Nelson in order to find time for a journey to Canada on this business. The new Premier, who still has Sir Thomas in his cabinet, is faced with a recrudescence of the separation movement in the north. Mr. Bowell, meanwhile, is in Canada again, having stopped at Honolulu on the return journey to preach the gospel of the proposed cable.

RECORD OF CURRENT EVENTS.

November 20.—Commissioner Blount's report on Hawaiian affairs made public ; it upholds the policy of the Administration....27,000 coal miners will be thrown out of work by the Lehigh Valley strike ; the strikers begin to show an ugly temper at Sayre and Wilkesbarre.... New schemes for rapid transit in New York City devised....The great storm on the west coast of Europe is still raging ; the shores of England, France, Prussia and the Netherlands strewn with wrecks....Brazilian government forces said to be pressing the insurgents closely ; proclamation of the Empire by Mello denied in Europe....Lobengula tired of war....Prince Alexander buried at Graetz Work resumed at the English collieries.

November 21.—Hawaiian Minister Thurston denies the truth of the statements in Commissioner Blount's reportPresident Wilbur, of the Lehigh Valley, issues a circular offering to treat with his employees....A lynching takes place in an Iowa court room....Brazilian war ship "Nichteroy" sails from New York for the seat of conflict....An earthquake at Kuchan, Persia, on Friday, re-

ported to have almost completely destroyed the town.... Another bomb exploded at Valencia, Spain....Reports of Europe's recent great storm continue to add to the long list of disasters....Spanish forces will take the field against the Riffians.

November 22.—Freight trains begin to move on the Lehigh ; the employees reject President Wilbur's advances ; recruits are imported....A fire at Springfield, Mass., destroys \$500,000 worth of property....The Ways and Means Committee agree on a wool schedule on a basis of about 40 per cent....The insurgents gain ground in Brazil ; Pernambuco in a state of siege....Natives defeated in skirmishes with Spanish convicts....Anarchist club discovered and raided in Barcelona ; many arrests made in France, also....Belgium alarmed at the establishment of a German Army camp on her frontier.

November 23.—Fire in Detroit results in the loss of seven lives and \$800,000 worth of property....Coal men desire peace and endeavor to bring Lehigh Valley officials and employees together ; freight trains move at several points....The Matabele War is over and Lobengula is fleeing with the remains of his regiments beyond the Zambesi....Admiral Mello's ironclad "Javary," previously disabled, is sunk by the fire from a land battery ; her crew lost....Two hundred and thirty-seven lives were lost off the English coasts in the recent great storm ; 165 fishermen off Jutland....The report on the scandals in the Banca Romana implicates a number of Italian deputies, among them seven members of the present and previous cabinets ; Crispi and Giolotti both accused of guilty knowledge....Anarchist arrests frequent and troubles rife in Spain ; a nest of them discovered in Algiers.

November 24.—President Wilbur will not treat with the Lehigh Valley strikers ...A million dollar fire in Columbus, Ohio, destroys a hotel and three theatres....Steel interests in the Eastern section of country combine for the purpose, it is said, of raising prices....The Italian cabinet resigns and there is a wild scene in the Chamber of Deputies....Spain declines Muley Araaf's overtures for a truce for the Riff natives and will hold the Sultan responsible ...Nineteen-twentieths of the Scotch coal miners strike for increase of pay.

November 25.—Hat manufacturers lock out 4,000 employees at Danbury, Conn. ; they decide to employ no more union workmen....Yale defeats Harvard at football by a score of 6 to 0....Evacuation Day is celebrated in New York by the unveiling of a statue to Nathan Hale....Lehigh Valley officials fear violence at the hands of the strikers....Dupuy's cabinet goes to pieces at Paris, due to the Premier's efforts to rid it of its radical members....No cabinet has yet been formed at Rome ; further disclosures implicate thirty other members of the Chamber, Signor Martini and two of Garibaldi's sons in the bank scandals ; Caprivi encounters violent opposition to the commercial treaties proposed....Rumors of an impending financial crash in London.

November 26.—Petty violence begun by Lehigh strikers ; arbitration boards will try to meet President Wilbur....The Tariff bill is practically completed ; raw sugar remains on the free list, the duty on refined sugar is reduced, reciprocity stricken out....The crew on a Lake Shore freight train drive off eight robbers after a sharp fight....Twelve thousand people were killed in the recent earthquake at Kuchan, Persia....Imposing obsequies held over the body of Prince Alexander, at Sofia....A detachment of Mexican troops wiped out by border rebelsGeneral de Campos goes to Melilla to take charge of the forces.

November 27.—The full text of the new Tariff bill is made public—wool, coal, iron ore, lumber and salt on the free list ; nearly all duties ad valorem instead of specificSlight shocks of earthquake are felt in New York, Vermont and Canada....Lehigh strikers mob a little station ; trains move irregularly ...The machinery for John Y. McKane's trial set in motion....Nine officers of the Madison Square Bank indicted....Zanardelli, President of the Italian Chamber, will form a new ministry....A

revival of dynamite outrages in Dublin....Caprivi receives an infernal machine from France....Desultory firing continued in Rio Bay.

November 28.—Lehigh labor chiefs summoned to Philadelphia for conference; officials claim that the back bone of the strike is broken....Col. E. S. Otis nominated to be Brigadier-General, to succeed Gen. W. S. Carlin... Gov. Tillman, of South Carolina, denounces the federal judiciary in discussing railroad interests in his annual message....The Postmaster-General issues his first report.... Emperor William also receives an infernal machine from Orleans....Spain is pouring troops into Africa....A memorial, consisting of two stained glass windows, to Lowell is unveiled in Westminster Abbey....The Italian Army will be reduced by two corps.

November 29.—President Wilbur will yield nothing to the Arbitration Boards....It has been practically decided to levy no tax on incomes, but on legacies and the net earnings of corporations, in the new Tariff bill....Secretary Lamont makes his report of the War Department....Thirty people are killed in a railway accident near Milan, Italy....An anarchist tunnel is found under a street in Marseilles....Cholera is raging at Teneriffe.

November 30.—Secretary Herbert's report to the President, making his representations of the achievements and needs of his Department, made public....Police are called out for the protection of Lehigh trainmen from strikers; trains move regularly....The Yale-Princeton football game results in a victory for the latter by a score of 6 to 0....Brazilian insurgents gain ground; they win a victory in Rio Grande do Sul....The Credit Mobilier, in Rome, suspends payment....Casimier-Ferrier undertakes the formation of a cabinet at Paris, in place of Spuller, who resigns the task....Twenty persons killed in a fight with Cossacks in defense of a Catholic church at Krosche which was ordered to be closed by the Russian government...The great cathedral at Marseilles, begun in 1852, consecrated with imposing ceremony.

December 1.—McKane's trial for contempt begun in Brooklyn....Several trains wrecked on the Lehigh....Admiral Mello leaves the harbor of Rio Janeiro with his flagship to intercept the new government vessels from New York....The Reichstag votes to readmit Jesuits to Germany....Anarchists display activity in many European capitals.

December 2.—The Lehigh Valley railroad tied up by wrecks all along its line, resulting in the loss of several lives and the destruction of much property; at White Haven, fire communicated from a wreck consumes \$200,000 worth of property....Many buildings burned in Baltimore, with an estimated loss of \$700,000....Chicago police accused of collusion with gamblers; Democrats and Republicans select their candidates for the Mayoralty....Scarcity of fuel compels the closing of many factories and is the cause of much suffering among the poor in England; financial matters otherwise much improved....Influenza of an infectious type appears in London....The dispute between France and Germany concerning the Cameroons Hinterland and the Anglo-German Convention to be settled by arbitration.

December 3.—J. J. Van Alen refuses to accept the Embassy to Italy....Very few trains move on the Lehigh, the weather aiding the strikers....Comptroller Eckels' report shows that the currency during the past year has been increased by more than 36 millions....Anarchist meeting in London a failure....Württemberg's failure to conduct summer army manoeuvres results in strained rela-

tions between it and the empire....The Riffians have promised Muley Araaf to stop fighting....Chaos reigns in Servia in all the departments of the civil service....Ivanoff's plot to kill Prince Ferdinand stated to be only one of a series....The distress among the Russian peasantry from debt and famine increasing....Zanardelli's cabinet nearly completed.

December 4.—The first session of the Fifty-third Congress convenes....The President's message reviews our foreign relations, asks for authority to call an international monetary conference and approves the Wilson bill....The French cabinet narrowly escape defeat in their opposition to a measure to grant amnesty to political offenders....Boselli's refusal of the Finance portfolio excites suspicion and distrust of Zanardelli's cabinet; its tenure of office likely to be short.

December 5.—Advices from Hawaii state that Minister Willis will not act until he hears again from our government, meanwhile, peace will be preserved....The cutter "Corwin" sails for Honolulu, carrying, it is believed, instructions to Minister Willis....The Lehigh strike nearing its end....Steamer "Jason" wrecked off Cape Cod; 27 of her crew probably lost....Georgia will have State banks....Dupuy elected President of the French Chamber....Zanardelli's cabinet at last completed....Caprivi encounters violent opposition to his Russian and other commercial treaties....A buffer State, north of Siam, will be formed between the English and French possessions; it will not include Luang Prabang, so much coveted by France.

December 6.—The Senate calls upon the President for all the information as to Hawaiian affairs in his possession....The end of the Lehigh strike officially proclaimed by Brotherhood officers; the men gain their chief points....Trial of Daniel Coughlin for the murder of Dr. Cronin begun in Chicago....The Italian cabinet, after a life of a day, goes to pieces....Mello cruising with his ships near Rio....M. Gruichs has organized a cabinet in Servia

December 7.—Lehigh strikers go back to work as fast as places can be found for them....A bank at South Bend, Ind., is looted at noon of \$15,000....McKane's hearing in Brooklyn is ended....The cruiser "Marblehead" makes 18.94 knots on her trial trip....The Manchester Ship Canal formally opened....Professor Tyndall's death caused by an overdose of chloral, administered by mistake by his wife....General Campos disbands the convict guerillas at Melilla....At Rio, heavy firing forces the insurgents to anchor further from shore. Revolt in Para suppressed.

December 8.—The Bankruptcy bill defeated in the House by striking out the enacting clause....Minister Willis declares to President Dole that he has no authority to use force at Honolulu....The Spanish police make a discovery of an anarchist headquarters at Mesina de Rio Seco, where they find papers containing names, information about the societies and their doings....Crispi will undertake the formation of an Italian cabinet....Admiral Gama, in a proclamation at Rio, advocates restoration of the monarchy....Sultan Muley Hassan going to Melilla to confer about the Riff war; he is unlikely to accept Spain's ultimatum....Lobengula desires to surrender....The English coast gale-swept.

December 9.—An anarchist bomb exploded in the French Chamber, injuring eighty persons, among them thirty deputies; Dupuy wounded....News from Hawaii, dated November 22, states that the Queen has asked

protection of the Provisional government; she refuses to be restored unless the United States will maintain her on the throne.... Canada asks indemnity for Victoria sealers seized by this country.... The Germania Club, of Chicago, insults Gov. Altgeld, by pointedly refusing to allow his portrait to be hung in the house.... A Southern Pacific train wrecked by tramps.... The situation in Servia becomes worse daily, and intervention by Austria and Russia is looked for.

December 10.—Kansas invaded by an army of tramps as a result of the proclamation by Governor Llewelling that the vagrant law is unconstitutional.... Chicago and Toledo are actively engaged in raising money for the relief of distress among the poor and unemployed.... Auguste Vaillant, the anarchist who threw the bomb into the Chamber of Deputies, has been caught.... His object was to kill President Dupuy.... A granary in Antwerp is burned with a loss of \$1,600,000.... Report of the destruction of Nietheroy confirmed.... Mello gaining sympathy.... Germany will help Italy through her financial crisis.

December 11.—A revised draft of the Tariff bill submitted to the Ways and Means Committee, yielding to the demand for more protection.... Riots occur in Sicily and Southern Italy, accompanied by fearful barbarities on the part of the mob.... The Kaiser's proposal to bring the Würtemberg army under the control of the Berlin Office is exciting much opposition in the former state.... Paris bomb thrower removed to the Prison de la Sante; his trial will occur next month.... Repressive measures against anarchists will be undertaken by nearly all European governments.... Peixoto will begin active operations in Rio Harbor.

December 12.—Hawaii will resist, by force of arms if necessary, any attempt to restore the Queen. Government houses barricaded and protected by cannon.... The Lehigh strike cost the company half a million dollars. The men dissatisfied with the new rates of wages.... Sharp debate in the House over the admission of Utah to Statehood.... The Tariff bill not yet completed.... Four negroes lynched in Alabama for one crime.... An operation will be necessary to save the life of the Paris bomb thrower, due to a concealed wound in the leg.... England will spend \$40,000,000 on her navy.... Sicilian anti-tax riots continue.

December 13.—A caucus of Democrats in the House has been called to consider the Tariff bill.... Admiral Irwin sends word the Hawaiian government has 1,000 men under arms and will fight.... Wreck on the Pennsylvania Railroad; many passengers injured.... Troops worsted by rebels in the mountains of Chihuahua, Mex.... Matabeles, driven to bay, inflict a defeat on the British.... The merry war in Brazil goes on and Admiral Da Gama takes two island forts at Rio.... New measures against anarchism to be rigidly enforced in Europe; bombs found in Madrid.

December 14.—McKane and three of his election inspectors found guilty of contempt.... Fire destroys property in the business portion of Buffalo to the value of \$1,000,000.... The Election Law Repeal bill reported in the Senate.... Disgruntled Democrats in the House invited to confer on the Tariff bill with the committee.... Evidence found that the Paris bomb thrower, Vaillant, had accomplices.... A stinging defeat administered to Socialists in the French Chamber.... Sig. Crispi has completed his cabinet.

December 15.—A span on the Louisville Bridge falls, carrying down 45 men and killing at least 21.... The

House votes to admit Arizona into the Union; Senators Morgan and Frye urge the government to take control of the Nicaragua Canal.... Accidents of various kinds occur on four railroads, resulting in injury and loss of life.... Destructive fires in New York City and New Haven.... Russia declines France's proffer of a Mediterranean port.... The Shereef offers satisfaction to Spain.... The Spanish, Servian and Roumanian treaties passed by the Reichstag.... Rio completely blockaded.

December 16.—Two schooners with their crews lost off the New England coast.... 500 houses flooded in South Buffalo by an overflow of Buffalo Creek.... French spies sentenced by the Leipsic Court to imprisonment in fortresses.... The government is considering a scheme for the reclamation of British shore lands.... Anarchists are being vigorously prosecuted everywhere in Europe.... The news of the British defeat in Matabeleland confirmed.

December 17.—Three men killed and four injured in a wreck on the C. O. & S. W. R. R.... Report of ravages by fire and water in China and Japan brought by steamers.... Da Gama's proclamation increases the popularity of the insurgent cause in Brazil.... Anarchists threaten terrible reprisals in case of Vaillant's execution.... Sicilian agrarian riots abate.... France and Belgium alarmed over the German fortified camp at Malmedy, on the Luxembourg frontier.

December 18.—The President sends his message to Congress on the Hawaiian question.... Distress among the poor and unemployed increasing; measures for their relief to be undertaken in New York, Boston and Pittsburgh.... Cordage Trust receivers permitted to sell the property for \$5,000,000.... Two hundred anarchists expelled from France; other governments adopting stringent measures.... Cannonading kept up constantly at Rio; the national finances in an extremely bad way.... A bill makes the ground granted to Russian peasants when the serfs were freed inalienable; persecution of Catholics continues.... Sicilian anti-tax riots break out afresh.

OBITUARY.

November 21.—Ex-Gov. Jeremiah Rusk, of Wisconsin.

November 22.—William T. Coleman, California's foremost citizen and chief of the famous Vigilance Committee of 1851.

November 23.—George Kemp, of the wholesale drug firm of Lahn & Kemp, New York City.... Charles Hérissin, a distinguished French lawyer, public man and officer of the Legion of Honor.

November 24.—Major Morgan C. Hamilton, of Texas, ex-Senator and Comptroller of the Treasury.... Ex-Gov. John Jacobs, of West Virginia.

November 26.—A. M. Scriba, formerly bank examiner.... John Straiton, of the firm of Straiton & Storm, cigar manufacturers, New York City.

November 27.—The Rev. Dr. John L. Nevius, American missionary in China.... Emile, Viscount de Kermenguy, Deputy for Finisterre, France, and one of the oldest Legitimist members of the Chamber.

November 28.—Dr. W. H. Holcombe, President of the American Institute of Homœopathy and writer on various topics.... Col. N. B. Eldredge, ex-Congressman from Michigan.... Capt. M. P. Wild of Portland, Me.

November 29.—John J. Kiernan, ex-State Senator of New York.... Commander De Haven Manley, retired naval officer.

November 30.—Major M. C. Kizer, one of Atlanta's old-

est and wealthiest citizens.... George David Brown, author and founder of the United Press Association.... Major-General Alexander Cunningham, of the British Army in India, on November 28.

December 1.—Judge Edward Coke Billings, of the U. S. District Court of Eastern Louisiana.... Gen. William Lilly, Congressman-at-Large from Pennsylvania.... Major Charles J. Dickey, a retired army officer.... Samuel Richards, an American artist.... Gerald Fitz Gerald, fifth Duke of Leinster.

December 2.—Charles Kozminski, a prominent Polish Hebrew banker of Chicago.... Martha Wilson, founder of the Home for Old Ladies.... George O. Willard, writer and dramatic author.... Charles J. Hays, press reporter of the House of Representatives.... Dr. Paul Hoffmann, Assistant Superintendent of Public Schools, New York City.... Pauline Cushman, the noted scout of the late war.... George Guy Greville, Earl of Warwick.

December 3.—Joseph D. Potts, President of the Empire Steamship and American Steamship Companies.... Willis Raney, ex-secretary of the Louisville and Nashville railroad.... Stephen B. Ransom, oldest member of the Hudson County, N. Y., bar and one of the founders of the Republican party.

December 4.—John Tyndall, the eminent scientist... John Chester Buttre, a leading steel engraver in this country.... Bishop Power, of St. Johns, N. F.

December 5.—Ex-Senator David M. Read, of Connecticut.... George W. Grandey, a well-known lawyer and statesman of Vermont.... The Rev. Joseph Johnson White, of Williamsburg.

December 6.—Henry Goebel, believed by many to be the inventor of the incandescent electric lamp.... Lord Strathallan, heir presumptive to the estates and titles of Perth.... Herr von Schmid, Wurtemberg's Minister of the Interior.

December 7.—Isaac C. Lewis, President of the Meriden Britannia Company.... The Rev. David Jewett Waller, of Bloomburg, one of the leading citizens of Northeastern Pennsylvania.

December 9.—Royal W. Merrill, financial editor of the New York Press... Fordyce D. Barker, of New York.... Bishop J. J. Moore, of Greensboro, N. C.

December 10.—Hon. Nathan A. Farwell, ex-U. S. Senator and prominent citizen of Maine.... Walter Smith Coles, a lawyer of this city.

December 11.—Hon. Jeremiah H. Murphy, ex-member of Congress from Iowa... Jacob B. Jackson, Governor of West Virginia for four years.... Admiral Sir John Corbett, K.C.S., of the British Navy.

THE LATE JOHN TYNDALL.

December 12.—Col. Alton R. Easton, veteran of the Mexican and Black Hawk wars and for whom the towns of Alton, Ill., and Easton, Maine, were named.... Prof. Hans G. C. von der Gabelentz, the distinguished German Orientalist.

December 13.—Thomas H. Hassett, an Irish patriot in the time of the attempted revolution of 1865.... The Rt. Rev. T. B. Lyman, Episcopal Bishop of North Carolina.... Edward Horwitz, editor and proprietor of the Philadelphia *German Demokrat*.... Dr. L. Dokics, President of the Servian Council of State.

December 14.—Henry W. Torrey, emeritus professor of history of Harvard University.... Vicar-General Michael McCabe, of the Providence Diocese.

December 15.—John L. Porter, chief naval constructor of the Confederate States, builder of the famous "Merri-mac".... Thomas Taylour, Earl of Bective.

December 17.—Dr. Wm. S. Lawton, president of the Augusta and Savannah railroad.

December 18.—George de B. Keim, ex-President and ex-Receiver of the Philadelphia and Reading Companies.... Consul-General Alfred D. Jones, to China, en route from Shanghai to San Francisco.

CURRENT HISTORY IN CARICATURE.

AN OLD FABLE BROUGHT UP TO DATE.

A countryman having some grain to carry to the mill, was bothered as to how to balance the load upon his donkey's back. Finally he hit upon the expedient of placing a large stone in the other end of the sack. Thus did he balance matters to his great satisfaction—but to the doubling of the load on the donkey.

RELIEF FOR THE UNEMPLOYED IN AMERICAN CITIES.

BY ALBERT SHAW.

ANY attempt at a statistical estimate of the number of wage-earners now the victims of enforced idleness throughout the United States would rest upon data too insufficient to give it much value. As some one rather pithily remarked the other day, so well informed an authority on labor questions as Professor Ely would give an estimate reaching well into the millions, while on the other hand so expert a statistician as Mr. Edward Atkinson would probably not be able to find more than a hundred thousand in the entire country. The remark, of course, was intended to show to what extent the habitual point of view is likely to bias the inquirer's judgment in a matter where no precise data are available. Certainly there has not been known for at least twenty years a time when so high a proportion of workingmen were cut off from their regular means of support, with so little prospect of an early return to their places. Factories are either shut down altogether, or are run with reduced forces. The shrinkage of the volume of railway traffic has thrown out of employment thousands upon thousands of men usually engaged in the service of the common carriers. The building trades are either unprecedentedly dull, or wholly paralyzed, and consequently the carpenters, brick masons, stone workers, plasterers, and various other crafts dependent upon finding work in house construction, are experiencing, not the usual three or four months' leisure out of twelve, but five or six months of inactivity, with no very good prospects before them. In Pittsburgh, there is an army of idle men from the iron, glass, coke and other representative Pennsylvania industries. In New York, the tailors, mechanics and operatives on the east side are, according to reliable reports, out of work to the extent of about half of their number. In Chicago, a reaction from the exceptional demand for labor occasioned by the World's Fair has been a special cause, co-operating with the general industrial depression; and in consequence more than one hundred thousand workers are out of employment in that city. A state of things which has thus affected the great industrial centres has been felt in many of the small manufacturing communities with a severity quite as great in proportion to their population.

Fortunately, a hundred thousand men temporarily out of work in an American city does not mean a hundred thousand applicants for charity, or subjects for relief measures. The greater proportion of the out-of-works are able unaided to tide over, for a period. Many of them have good accounts at the savings banks, many others have friends and relatives to help them, many more have lenient landlords and credit with the grocer, and many enjoy a

good understanding with their employer, whose shop or mill it is confidently believed must be running again before many weeks. The buoyancy of American life is a thing not understood by European visitors. In a city like London there is always a vast contingent of hopeless and helpless out-of-works, and there is a comparatively scant opportunity for the individual to better his condition. In this country, despite all assertions to the contrary, there is generally work enough for everybody who is willing to work, at wages which with proper economy will enable the worker to lay aside something for a rainy day. The operation of natural economic laws will tend to draw a part of the temporarily congested population of the towns back to the land, and out to the newer parts of the country, where there is still room for millions of people and a fair chance by hard work and frugal living to secure a safe livelihood.

The situation, therefore, is not one which justifies pessimism, socialistic raving, gloomy foreboding, or anything else except prompt, sensible and well-planned efforts to prevent actual suffering and to assist in the readjustment of times which are for the moment out of joint. With all the work that charitable societies and relief agencies must do, it will still remain true that by far the largest part of the task of preventing or alleviating distress must be performed in a hand-to-hand way by individuals. Thus every humane employer must do everything in his power, first, to keep all his regular force at work, and, second, if he is unable to keep them at full and regular work, to see that none of them become objects of public charity. Furthermore, it should be the business of the more prosperous employees and workmen to show a kindly regard for their less fortunate associates. Again, every man and woman who can in one way or another find employment to give, should make it both a duty and a privilege to distribute work as widely as possible. It is a good thing, for example, to give work to dressmakers, seamstresses, tailors and all classes of honest people who can thus be kept from the humiliating necessity of applying for charitable relief. A vast deal of the most valuable kind of assistance can be rendered by judicious advice in helping the unemployed to make their slender resources go as far as possible. Medical and kindred forms of relief and advice can often be supplied without cost where it would be unwise and unfortunate to give money.

Thus when due allowance is made for those of the unemployed who have saved enough to take ample care of themselves, and for those who through their employers or other friends can be tided over and kept from the necessity of applying for relief to the public

authorities or to charitable societies, the residue of the less fortunate will not appear so formidable an army. From these there ought always to be subtracted the habitual paupers and professional mendicants, and the vagrants or tramps who verge very closely upon the criminal class. At a time like this, the police and municipal authorities can render valuable service by vigorously enforcing the laws against habitual vagrants. These men ought to be promptly committed to public work-houses and held for as long a term as possible, doing hard and disagreeable labor for the benefit of the community, in payment for their food and lodging.

The elements that still remain are those for which, in all parts of the country, active measures for organized relief are now being taken. The plans that have been agreed upon are for the most part characterized by admirable judgment and based upon sound experience. The principles that underlie these plans are very simple. It is agreed that, in every possible case, work rather than money or food or clothing or fuel ought to be provided. It is agreed that in every case where alms are bestowed there should be a kindly and prompt, but also a frank and thorough, investigation into the merits of the application. In spite of all that can be done, there will undoubtedly be much heart-rending deprivation and suffering among the poor during the next few months. But, speaking broadly and generally, it may be asserted with some confidence that the means provided are likely to be sufficient to supply the most pressing needs, and that upon the whole the response of intelligence, charity and brotherly good will promises to be equal to the heavy emergency. From information received for the most part as late as the middle of December I have compiled, and herewith present, an account of what has been undertaken in a number of important cities.

I. BALTIMORE'S RELIEF ORGANIZATION.

In Baltimore on December 6 there was organized a Permanent Central Relief Committee, of the most representative character, the movement including not only the charitable societies and organizations of the city, but also the Board of Trade and all the leading mercantile associations and exchanges, as well as representatives of the police, judicial and executive branches of the local government. The charity work of Baltimore is fortunate in having the wisest and ablest counsels at its command. Baltimore has tried soup kitchens and police distribution of relief funds in former years, and has fallen back upon the sound principle that the thing to give is work, and that the giving should be done in the quietest and least conspicuous manner possible. The following paragraphs from the address issued by the Baltimore Relief Committee are worth quoting :

The recent business depression has increased greatly the number of respectable residents of Baltimore, many of them heads of families, who are out of work. At the same time the number of professional vagrants coming here from other cities is reported by the police and others

to be far greater than usual. This is accounted for in part by the action of neighboring cities, notably Washington, where the police stations have been closed to lodgers and a municipal wood yard opened, offering lodging in exchange for work and a bath. Last winter the privilege of sleeping in public places, herded together in dirty clothing, and the giving out of food at public places for the asking attracted vagrants here and made it easy for them to underbid the labor of our own citizens who had families to support. The giving out of food and money to unknown applicants at private houses also encouraged the increase of this class. The sympathy of the community was too often lavished on professional vagrants, to the exclusion of the shrinking and suffering poor, who were too feeble or too sensitive to ask alms on the street or stand in line with a rabble at public relief stations.

In view of these facts, the undersigned have associated themselves as a central relief committee, not with the idea of forming new and unnecessary charitable machinery, but to emphasize, first of all, the necessity of supporting by increased contributions the regular charitable agencies of our city, and to meet the needs of our own citizens and relieve the city of this army of vagrants by providing relief in work. With these aims in view, the committee urge the public to contribute to establish charities. If desired, the committee will convey to such associations any donation that may be offered, in such proportion that may seem best, and will render strict account through the public press of the sums received and expended.

If the city authorities will agree to purchase broken stone for use on the roads, the committee will endeavor to see that a stone-breaking yard is opened to give work to our own citizens who are in need, especially to those who have families dependent upon them. This plan has been tried with good results in Cincinnati and elsewhere.

The committee also ask public donations to a special fund for increasing the requisite facilities in providing work for the homeless, enlarging the Friendly Inn, if necessary, and establishing a branch in East Baltimore or elsewhere. With the co-operation of the public our stations may be free from vagrants and our streets from worthless beggars, and the work thus provided would relieve the charitable public of a heavy burden and the workingman of a dangerous rival, without working any unnecessary hardships on the homeless poor. Moreover, the charitable citizens of Baltimore may then be assured that more relief will be provided for deserving persons who may be in need, and that the dangers will be avoided which come from indiscriminate alms giving.

Mayor Latrobe at once expressed his approval of the plan of a relief stone yard, and there is every indication that the Baltimore organization will be fully able to cope with the situation in that community.

II. HOW BOSTON APPROACHES THE PROBLEM.

Boston, always recognized as a centre of philanthropic activity, is fully alive to the exceptional demands of the present winter. A detailed estimate in December, published as one of the Andover House tracts, places the number of Boston's unemployed at upwards of 40,000. The leaders of opinion in Boston, as in Baltimore and in other communities where

charitable work is well organized, are emphatic in assertion of the sound doctrine that relief funds should, for the most part, be intrusted to experienced and regular agencies rather than to novices devising untried schemes on false or doubtful principles. All the leading charitable organizations of Boston have united in a statement entitled "How to Relieve Distress Among the Poor this Winter." The address is a model of calmness and good sense. The following paragraphs are much to the point :

To diminish as far as possible the sufferings of the poor, more money than usual will have to be provided, and also more personal service in volunteer visiting.

The emergencies of this year will be of the same kind as in other years, only greater in number and degree. Such emergencies the various charitable societies of the city have been trained to meet by long years of experience and faithful study, but they will need efficient and increased support from the public.

It must be remembered also that the best means of averting suffering will be the continuance of legitimate employment and of all expenditure that means employment.

No society wishes to take the place of such work or of private charity. Every one knows personally of poor people whom he wishes to help in his own way, and no doubt the number of these will be greater than usual this year ; but worthy families without friends able to help them will more than ever be brought to the notice of the societies.

Hard times increase also the number of unworthy persons who ask aid. To give money or food to persons who ask it in the street, at the door, or in the business office, is worse than useless—indeed, it is generally harmful, and leads to untruthfulness and deception. The money now wasted in this way, if given for genuine need, would do much good.

The labor unions of Boston are opposed to clamor and agitation, and are taking steps to make a careful inquiry into all worthy cases, meanwhile doing everything in their power to find work for those needing it. They are endeavoring to secure from Congress the opening up of the Charlestown Navy Yard. Mayor Nathan Matthews, Jr., who has just been re-elected by a large majority, early in December called together representatives of all the charity organizations, all the labor organizations, editors of newspapers, and leading clergymen of all denominations, together with twenty or thirty prominent citizens well known for their philanthropic disposition. At a final meeting on December 18 this representative committee discussed the question of the unemployed in the Council Chamber under the presidency of Mayor Matthews, and decided upon the plan of a permanent executive committee of fifteen citizens who should receive subscriptions and take general charge of relief work. A popular subscription list was at once opened. This general committee will work in the closest co-operation with all reputable societies and organizations. Its effect will be to secure exceptionally large sums of money, and this money, so far as possible, will be expended in providing work for those who are in most need of it. It is probable that Boston will try the plan, to some extent

resorted to elsewhere, of pushing municipal and public work under the supervision of the municipal authorities, the extra workmen to be paid low but living wages out of the relief funds and the whole work of special relief to be so arranged and prosecuted as to enlist the harmonious co-operation of the associated charities and other existing agencies. There can be no doubt of Boston's disposition to deal adequately with the problem.

III. CINCINNATI'S ADMIRABLE ARRANGEMENTS.

Cincinnati is fortunate in the possession of exceptionally well organized and strongly sustained associated charities under the general secretaryship of Mr. P. W. Ayres. That exceptional work would have to be done in the present season was realized early in the autumn and provision was made accordingly. Mr. Ayres furnishes us with the following statement:

The need in Cincinnati up to the present time has been admirably managed. A committee of citizens, including several leading pastors and the mayor of the city, formed a committee for supplying work. This committee decided to use the wood yard of the Associated Charities, and raised three thousand dollars for the purpose. In cases of sickness or old age, aid was sent to the home after proper examination. One-third of the above amount was raised by contributions from the churches. The Treasurer of the Associated Charities was made Treasurer of the Citizens' Committee, in order that there should be but one disbursing agent in the city.

Later, the city authorities appropriated thirty thousand dollars for use in the parks. The Park Commissioners employed for the most part only those who were recommended by the Citizens' Committee after the lists had been compared with the lists of the Associated Charities. Only those who were heads of families and residents were given work in the parks ; all others were offered employment at the Labor Yard. Nothing has been given away except to the sick or the aged. There has been no public soup house, which we believed would be a public nuisance. There has been comparatively little idleness, and no waste or confusion.

About one thousand men are now at work on the parks daily when the weather permits. A few hundred more work irregularly at the Labor Yard. No one suffers, and the situation seems healthy. The city authorities have cut off the usual out-door relief for the month of December, and are supported by the Citizens' Committee and others of the most intelligent men and women who are interested in social problems.

A portion of the unemployed have held daily meetings, and have made application for sums of money for their support, but have received comparatively little. The majority of the unemployed have been strongly in sympathy with the Citizens' Committee and the Associated Charities, and are so at the present time.

With the necessary additions to the number of volunteer visitors, this well unified relief system in Cincinnati seems to be capable of sufficient expansion to provide fairly well for the entire situation. Heads of families resident in Cincinnati receive work at the regular rate of one dollar a day. Single men are per-

mitted to work for their meals and lodging at any time. Women are employed in a workroom making kitchen rugs and other articles.

IV. THE SITUATION IN CHICAGO.

The situation in Chicago is so exceptional, owing to the presence of some thousands of men who may be termed "stranded strangers," that various measures otherwise objectionable may find temporary justification. The soup houses and other agencies for distribution of food to able-bodied men are simply evidences of a lack of the complete organization that ought to find some way of providing these men with means for earning food and lodging. Meanwhile, for the sake of a system and a supervision, there has been organized a great central relief and charitable clearing-house association, with a managing committee of fifty men and women. The committee of fifty includes the mayor, several aldermen and other officials; a number of prominent citizens of the character of Mr. Lyman J. Gage and Mr. Cyrus McCormick; representatives of leading charitable organizations; leading members of labor unions, and others having special qualifications. The principles of this central organization are stated as follows:

The theory and object of this association are to bring into close contact every charitable organization in Chicago through the Central Bureau, and thus there will be gathered into one place specific information from all quarters of the city as the causes of want and the methods inaugurated for the relief of the suffering. It is not the object of this organization to dispense charity directly to individuals and families, but to inaugurate such methods as will secure a dispensation of aid to the suffering by organizations now existing the most economic and effective. If it accomplishes the objects at which it aims there will be brought to one central bureau full and complete information so that each charitable organization will know just what every other charitable organization is doing and the field covered by each. If it be discovered, as it probably will be, that the whole city is not adequately covered by existing organizations, it will be the purpose of the Central Bureau to encourage and develop such auxiliary organizations as may be needed to cover such districts as may be unprovided for. It is further proposed by the central organization to secure from the public such contributions of money, food and clothing as it may prefer to intrust to the Central Bureau rather than to other organizations of whose needs, purposes or methods the donors may be inadequately informed. It is not proposed to interfere with the private gifts of any persons to any one of these organizations should they desire to so make them instead of sending to the central organization, it being contemplated that all such organizations will report to the Central Bureau the items of their receipts and disbursements and the general wants of the association and work to which they stand related. In dispensing food and lodging through any agencies now existing or that may hereafter be created, the money furnished by the Central Bureau will not be used except under the condition that able-bodied men receiving food and lodging shall render the equivalent for it in work, and with that end in view work for those who are willing and able to perform it will be provided by the street cleaning bureaus in

cleaning the streets and other agencies indicating a desire to furnish employment through this bureau.

One of the problems Chicago has had to meet is the rapid influx of tramps and incorrigible idlers attracted by the large dimensions of the free soup dispensaries and the apparent prospects of an indiscriminate support of everybody asking relief. Such people, however, will be doomed to early disappointment. The municipal authorities are using strong measures to keep out of the city all such undesirable visitors, and method is being rapidly infused into the relief work. One of the greatest needs has been the provision of decent shelter for honest and respectable but unfortunate men, and the enforcement in the clearest way of distinctions between tramps, criminals and idlers on the one hand, and honest people eager for employment on the other hand.

Out of what seemed at first a profitless clamor of voices rather than a businesslike programme in Chicago, there is at length visible a settling down to legitimate relief work along lines approved by experience, and under direction of those best fitted to cope with the problem in its local phases. On the drainage works, in the parks, on the streets and in other ways, the municipal government is doing what it can to provide work at \$1 per day. The churches have awakened to a keener sense of responsibility for the masses, and have come into a new and mutually advantageous contact with the labor unions and with thousands of individual workingmen between whom and the ministrations of the church there has been estrangement.

V. EFFICIENT MEASURES AT DENVER.

The exceptional distress of 1893 was felt at Denver, Colorado, sooner than at any other large town in the country, owing chiefly to the panic which last summer attended the closing of a great number of silver mines. Denver was flooded with men out of work, and the situation was met temporarily by the maintenance for a few weeks in August of a so-called Labor Camp. The State supplied a quantity of tents, and men out of work to the number of perhaps 2,000 were given food and shelter, in a systematic way, under restrictions which were not especially enjoyed by the "bummers" and the unworthy. The plan answered well for a momentary emergency, but was very properly abandoned as soon as possible. The railroads assisted in helping 1,500 or 2,000 men to return to former homes in States east of Colorado; the municipal authorities were able to find employment for a large number of men, and the various relief agencies and charitable organizations rose to the emergency in their several ways. The associated charities, under the presidency of the Rev. Myron W. Reed, demonstrated the usefulness of their work; and the situation was thus brought under control.

The most striking and interesting feature of relief work in Denver has, however, been that which the Right Rev. A. C. Peck, an Episcopal clergyman, has carried on in connection with the Haymarket Mis-

sion. This institution is primarily an inter-denominational gospel mission, among the poorest of Denver's population; but it has nobly recognized the true spirit of Christianity in giving friendly aid on the practical side of life, quite as eagerly as it gives hymns and prayers and religious admonition. The great feature of Dean Peck's work this winter is his magnificently conducted wood yard. The institution provides three excellent meals and a comfortable night's lodging for 25 cents. The charitable people of Denver purchase five-cent meal tickets and ten-cent lodging tickets, and give them in place of money to all applicants. The wood yard turns no man away who is willing to do the required amount of work for lodging and meals. In an average of three hours a man can earn tickets which provide him with his meals and lodging. The rest of his day is at his disposal to seek employment elsewhere. The great problem in conducting a wood yard on this plan is to find a market for the product. Dean Peck has succeeded in convincing the citizens of Denver so thoroughly as to the value of his work, that he no longer experiences any difficulty in selling at a fair price all the kindling wood, and fire wood in other sizes, that his yard is able to prepare with the labor that comes to it. Able-bodied beggars have quite disappeared from the streets of Denver as a result of this system. At the present time the number of men working in the wood yard is about 100 each day. The number of meals served in the five-cent restaurant is perhaps seven or eight hundred each day. The waiters and assistants in the restaurant receive their living and very small wages, their places being filled from the ranks of the unemployed as rapidly as they are able to find more remunerative work elsewhere.

The Tabernacle Helping Hand Institute, conducted by Mr. Thos. Uzzell, is another agency doing a great popular work. In helping the unemployed it has registered six or seven thousand persons in the past few months, and has found work for perhaps half that number. The Tabernacle also serves a useful purpose in assisting the poorest families to buy their coal at a very low price. Dean Peck informs us that with the opening of the new year there will be established under his auspices a plan by which women will be provided with an honorable chance to earn their meals and lodging. Thus the people of Denver, with the co-operation of the municipal authorities and the respectable citizens of all classes, and under the lead of such men as Dean Hart, Myron W. Reed and Thomas Uzzell, are manfully solving for their own community the problem of the unemployed.

VI. THE PLAN IN VOGUE AT LYNN.

Much attention, especially throughout New England, has been attracted to what is known as the Lynn, Mass., plan of relief. The Lynn relief system was put into operation by a citizens' committee early in October. The following statement explains the lines upon which the work was undertaken:

The Lynn Citizens' Labor Bureau commenced operations on the second day of October. It was initiated by

a meeting of citizens held at the Board of Trade Rooms to consider the increased applications for work from citizens who had hitherto been self-supporting. It was resolved to deal with the situation through the existing organizations, simply adding to the Associated Charities a Department of Labor, the work to be done on the city streets and parks, and to be paid for by a citizens' subscription. In order to avoid the well-known and serious perils of all attempts at special emergency relief,—such as calling in throngs of the workless from other cities, disturbing the regular lines of labor, encouraging imposition, and stimulating a profuse and chaotic private relief,—it was resolved to proceed under the following rules: 1. No public call for money, and no advertising of the bureau through the papers; subscriptions to be secured by personal solicitation, and the work advertised only through the churches and relief societies, and by the spectacle of the men at work. 2. No work given except to actual citizens of Lynn, in extreme need, and having no other friends, helpers, or resources;—these facts ascertained by thorough domiciliary investigation in every case. No rumors to be heeded, no guesswork to be relied upon, nothing to be done in the dark; actual knowledge to be the only basis of help. The results of investigation to be placed at the service of relief-giving societies and individuals. 3. A half-day's work for a dollar, and work arranged so as to enable each man to earn an average of three dollars a week,—this wage supplemented in cases of extreme need.

Five or six weeks after the work had been begun the following report was made as to the success of the plan:

So far the system has prevented absolute destitution, the influx of the needy from other cities, the storming of the City Treasury, much misapplication of charity and much loss of self-respect. The thorough investigation has been of the highest value—locating the quarters where the pinch of need is greatest, forestalling the astonishing activity and impudence of the charity impostors, bringing to the notice of the benevolent some cases of pecuniary hardship which a little good management relieves, uncovering many preventable causes of distress, and enabling the relief-giving societies and individuals to intelligently and effectively succor the destitute.

It had been found possible to obtain by subscription a sufficient amount of money; and the thorough organization and sound principles adhered to have given the charitable workers of Lynn a sense of adequate mastery of the situation.

VII. PHILADELPHIA'S PROVISION FOR THE UNEMPLOYED.

Philadelphia is world-famed as a city of homes of high average comfort, of little poverty, and of systematic and well-directed benevolence. Just now, however, it is estimated that there are 40,000 persons out of employment in that city who are usually at work in some wage-earning capacity. The following statement prepared for us by Dr. James W. Walk, general secretary of the Philadelphia Society for Organizing Charity, is a valuable *résumé* both of the regular and of the exceptional means employed in Philadelphia for the relief of those in need:

Endeavoring to give a succinct idea of the present extraordinary distress in the City of Philadelphia, and of

the means taken for its relief, I will present the subject under four captions.

1. *The normal status of poverty in Philadelphia*; 2, *the crisis*; 3, *relief through ordinary channels*; 4, *relief through extraordinary channels*.

NORMAL STATUS OF POVERTY IN PHILADELPHIA.

Philadelphia has enjoyed great prosperity for a number of years.

Pauperism has not increased in proportion to the growth of the population, and indeed it is probable that the permanent dependent class has to some extent diminished.

There is no outdoor poor relief given by the city except free medical attendance. Although there are a great number of hospitals, dispensaries and asylums of various kinds, there are but few benevolent corporations devoted to the relief of the poor in their homes. The outdoor poor are practically cared for by the Society for Organizing Charity, which, in Philadelphia, has this special feature different from such societies in most cities—viz., that in addition to the functions usually performed by associated charities, this society carries on a large relief work. The Protestant Episcopal Church supports a City Mission, whose relief work is of importance, and the other churches do some charitable work, but generally in a small way.

THE CRISIS.

The financial stringency and industrial stagnation of the summer were felt in the scarcity of employment, particularly for the workers in textile industries, upon which so large a part of the population of this city depend for support; but no marked increase in applications for aid was observed until the latter part of September. Then the local offices of the Society for Organizing Charity had many more applications for aid than usual. Little public attention, however, was called to the matter, until one of the newspapers began the publication of a series of sensational articles and opened a subscription to supply soup and bread to the poor of the Kensington district, where many of the large textile manufacturers are located. This led to widespread public interest in the matter and a number of relief societies were formed among the working people of the mill districts, which appealed for aid in a variety of ways. During the month of October the number of the unemployed steadily increased, and upon November 1 a conservative estimate placed the total of individuals—men, women and children—out of work, who were usually employed at this season, at 40,000. Of course, the number in distress was very much less than this, as a large majority of these people were thrifty and had made accumulations during prosperous times, upon which they now depend for subsistence; but there was a residuum of real and positive need. The situation since November 1 has grown steadily worse. It is not probable that the number of the unemployed has increased, indeed, some manufacturers have partially resumed operations; but a great many families have now exhausted their slender reserve resources and are dependent on public aid, and the cold season has emphasized the distress in many ways, particularly in the need for fuel.

RELIEF THROUGH ORDINARY CHANNELS.

The Society for Organizing Charity has continued to operate upon its well established plan, but has increased its official force and has appealed for additional funds for the relief of the unemployed. This society ordinarily expends, in all departments of its work, about \$50,000 annually. It is probable that the extraordinary distress of the closing quarter of the present year will increase this

amount for 1893 to about \$60,000, the additional \$10,000 being accounted for almost entirely by direct relief work. The Protestant Episcopal City Mission and other associations, of less extended operation, would show a similar percentage of increased expenditures.

EXTRAORDINARY MEANS OF RELIEF.

During October, as has been referred to, there were a number of aid societies formed among the workingmen of the mill districts, and they collected considerable quantities of material for relief, mostly provisions given in kind. The amount of money they received was inconsiderable. Early in November they had nearly all disbanded. It is probable that \$12,000 will cover the total value of the relief dispensed by these associations. They were badly organized, and most of them were not in the hands of well known or responsible persons. The public became convinced early in November that these ephemeral relief societies were wholly inadequate to deal with the distress, and general public sentiment called into the field the "Citizens' Relief Committee." This organization had existed for some years, devoting itself to securing funds in Philadelphia for distressed communities, such as the sufferers from the Russian famine and from pestilence and floods in the Mississippi Valley. Previous to the present emergency it had never dispensed money in this city itself. The committee, under the chairmanship of the mayor, took charge of the relief work early in November, and has made large appropriations to the Kensington district, and smaller amounts to other localities where the unemployed are most numerous. The funds have been derived entirely from benevolent gifts. When it undertook the work the committee had some money on hand, as a surplus from previous collections, and this has been added to until the total reached about \$16,000, although no general appeal to the public has as yet been made. The committee, in the six weeks of its operation, has expended \$15,000 for relief work, giving on an average about \$4 per week to a family of seven or eight members. The relief is dispensed by orders on provision dealers, only the less expensive articles of subsistence being provided. It is estimated that \$60,000 to \$80,000 additional money will be required to provide for the distressed in this city until the opening of the spring. Some heart-rending cases of destitution have been reported in the newspapers; but, upon investigation, most of these have been found exaggerated. It is not likely that any one has suffered starvation in this city; but it is very evident that the distress is widespread and severe. It may be added that the municipal institutions, the Almshouse and House of Correction, which ordinarily have an aggregate population of 3,500, have now 800 additional inmates, or a total of 4,300, and that the wayfarers' lodges, where homeless people are sheltered and fed, are crowded to the utmost of their capacity.

From Mr. Robert McWade of the Philadelphia *Public Ledger* we have also received a very interesting statement of the work done by the Citizens' Permanent Relief Committee, of which he is a leading officer for life. Organized some fifteen years ago, the committee has dispensed relief in different parts of the world to the amount of about two million dollars.

VIII. RELIEF WORK IN ST. LOUIS.

Mr. William F. Saunders, the private secretary of Mayor Walbridge of St. Louis, provides us with the following information as to the provisions which had

been made and were in operation in December for relief in that important city :

In St. Lo is there are several permanent arrangements for relieving the distress of the poor during the winter, and this season a number of new plans, in addition to the others, have been made and are to be put into operation.

The permanent arrangements are :

1. A contingent fund of \$11,000 a year, which is appropriated annually for the Mayor to spend in charity, transportation of paupers who can get work elsewhere or wish to go to relatives in better circumstances who can help them, and secret service of the city. There has been an unusually heavy demand on the fund this year, and the greatest discrimination has to be used to make it apply to cases of the most necessity.

2. The Provident Association, St. Vincent de Paul and Hebrew Relief Association each collect money from the benevolent and distribute it among the unemployed poor, buying them coal and bread and giving them also clothing obtained from the charitable. Of these associations the Provident is the largest and has the most money contributed to it.

The new plans for this winter are :

1. An entertainment for the benefit of the poor was given a few weeks ago, and tickets for it were sold by the police of the city among the citizens on their beats. About \$10,000 net was realized from this. With this money coal is bought, wholesalers giving reduced rates, and distributed at the police stations of each district to the poor, the police officers acquainted with the people in the vicinity being able to see that the provision is used to the best advantage and that few impostors are benefited. Food and clothing are also distributed at this station, some of it bought by this fund, some of it contributed by people.

2. A movement is on foot, prompted by the *Post-Dispatch* of this city, to raise a fund among citizens of \$10,000, to be spent in giving work to unemployed laborers on a lake in Forest Park which the city has for some time intended to enlarge but has not so far been able to improve.

3. The *Republic* of this city has a coal fund to which its subscribers contribute, the newspaper distributing the coal.

4. The *Globe Democrat* has conceived an original and effective plan. It has asked the wealthier people among its readers to give to a fund one share of some stock held by them, the stock to be afterwards put up at auction and bought in at its par value by the owner. The novelty of this plan has made it very successful, and the fund is rapidly growing.

5. Several soup houses have been established where men can get a meal and lodging for five cents apiece. The managers of these institutions sell their tickets in bundles of one hundred to merchants and others, and the purchasers instead of giving money when appealed to by the needy give them these tickets.

To what extent these measures are brought into harmony by a central committee, or through the supervisory assistance of a general charity organization, we are not informed. There is evidently no lack of zeal in St. Louis, and the combined projects mentioned in Mr. Saunders' letter would seem to be capable of expansion to the point of meeting any situation likely to arise this winter.

IX. PRIVATE AND PUBLIC CO-OPERATION IN ST. PAUL.

Perhaps in no other city in the country has there been a more satisfactory co-operation between the municipal authorities on the one hand and the private citizens and regularly organized charitable organizations on the other than in St. Paul. The methods which have been adopted there, and the results that have accrued, are so interesting that we are glad to be able to present them in the following statement prepared for us by Mr. Conde Hamlin, managing editor of the *St. Paul Pioneer Press* :

In order to deal with the problem of the unemployed a citizens' committee was formed early in October. A fund (contingent) of \$9,000 belonging to the city was placed at the disposal of the committee and an office was opened in the City Hall where the unemployed who desired work registered their names, the length of their residence and number of people depending upon them. The compensation was placed at \$1 per day. In October 2,884 days of work were done and in November 9,639, making a total of \$12,523, with an expenditure of \$398.76 for tools. When the \$9,000 was exhausted a fund of \$5,000 which had accumulated from the small excess of a multitude of assessments was used. The work done was grading of streets, improving Como Park by clearing away underbrush, grading, boulevarding and later by cleaning snow from the streets. Nearly 2,000 names are now on the list and from it is list are selected those who are given work, the aim being to employ those in greatest need. It is expected that the funds will be largely supplemented by subscriptions, a special committee for their solicitation having been appointed, and the amount thus realized will carry the committee up to January 1, when city funds will be available.

One of the plans of the special committee from the citizens' relief committee is to secure a monthly donation to a popular fund from all men who have steady employment, and the idea is meeting with general favor. The zest with which men are coming forward with voluntary offers is very gratifying to the committee, and it is claimed that a good many thousands of dollars will be realized in this way the present winter, to say nothing of the large contributions that will be made by men of means.

In addition to the comprehensive work done by this general committee, composed of leading citizens, much has been accomplished by other organizations, the action of which has generally been in harmony with the central organization. The Relief Society has done a great deal by providing temporary assistance in urgent cases. The donations of school children to the poor which have become an annual feature, this year were so generous that the effect will extend over many weeks. The supplies were in the form of food, clothing and fuel and were distributed by the Relief Society. A Friendly Inn was opened by the Bethel Society, where lodging and meals were to be obtained, the applicant sawing a certain amount of wood as pay ; the wood being sold at cost to consumers, thus making the institution self-sustaining. The A. O. U. W. opened headquarters in their hall and secured work for as many as they could, preference being given to members of the order. The King's Daughters have also done much to alleviate cases of necessity, and this is true of nearly every church society. The First

Ward also formed a society of its own and has looked after cases within its ward limits. The People's Church organized a salvage bureau, which repairs clothing and shoes donated and sells them for the trifle expended in their renovation or gives them to persons in need who have nothing wherewith to pay.

The people have shown the greatest interest in this work and indiscriminate giving is noticeable by its absence. Prices for work are such that they are an object for the needy but are an inducement also to watch for other employment. The greatest credit is due the citizens' committee which has furnished the wisdom for the entire work.

X. REPORTS FROM MINNEAPOLIS, MILWAUKEE AND CLEVELAND.

Minneapolis has not thus far formed a central organization for relief. The Associated Charities of that city, however, provide an efficient information office. As to the situation at that date the *Minneapolis Tribune* of December 15 makes the following statement:

Within the past forty-eight hours three different movements on a considerable scale have been set on foot for the relief of the needy. The Presbyterian churches of Minneapolis have resolved themselves into a relief organization and an employment bureau. The Swedish Americans have formed a similar guild for the support of their countrymen. First Ward citizens are similarly organizing to give employment to those who need it in their neighborhood. In addition to this volunteer work, the Associated Charities, under the guidance of experienced workers, are doing more than the usual volume of missionary labors, not to mention the vast amount of private work which never gets to the ears of the public. Undoubtedly Minneapolis is far less troubled with poverty and lack of employment than the majority of the cities of the country. Cases of actual suffering in this city are comparatively few. Nevertheless every helping hand should be welcomed.

It is quite possible that Minneapolis may yet inaugurate the plan of utilizing surplus unemployed labor in street and park work, after the plan so well tested at St. Paul. An exceptionally large number of so-called "tramps and vagrants"—many of whom, however, are doubtless more unfortunate than unworthy—have been given nightly lodging in the central police station; and the Mayor's plan of offering these municipal guests a bowl of soup and a piece of bread in the morning has been strongly opposed by the Associated Charities. As a permanent plan it could hardly be defended; although as a temporary measure, pending the organization of a better system, it would seem to be in accordance with the simplest dictates of humanity.

An unusual number of men out of work is reported from Milwaukee. There are 30,000 Poles in that city, most of them being common laborers, and one day last summer 500 of them went in a body to the Court-House square and called on the Mayor for relief. After a week or two the Mayor was again waited upon by a large body. Then, in consultation with the Board of Works, he decided that there were many street improvements that had been contemplated and

not begun, such as the grading of new thoroughfares, the laying of pipes, the construction of sewers, and development work in general in the newer parts of the town. In that way a large body of able-bodied men have been kept in employment. Meanwhile the associated charities have had on their rolls some 2,000 persons or more, whereas they have never before carried more than 100 names. The county Supervisors have given as much employment as possible, and there has been a general agreement in Milwaukee that it is advisable to use the public funds so far as possible in giving work to men who would otherwise have to be supported by public charity. Milwaukee seems to be abundantly able, through the joint efforts of public authorities and the organized charitable and relief societies, to meet the exceptional conditions that confront it.

In Cleveland, Ohio, the Citizens' Relief Association, working through an executive committee, has adopted the general plan of employing men at a low rate of wages, and then placing them at the disposal of the municipal authorities, chiefly for work upon the streets. The services of some hundreds of men are thus utilized. It has been proposed to undertake certain large works of public improvement which are deemed desirable, and indications seem to point to a fairly adequate grappling of the situation. One of the measures proposed is the demolition of an abandoned reservoir, and filling up of an adjacent area of low ground to make a needed cemetery extension. It is also proposed to enforce ordinances requiring the removal of snow from sidewalks at the expense of owners of adjacent property. It is estimated that this work alone would suffice to employ a large number of men.

XI. PITTSBURG ORGANIZED AND AT WORK.

The Pittsburg general scheme of relief, which is a highly important one, went into actual operation on December 18. The plan, stated in its briefest terms, is that of a central citizens' committee securing a large relief fund and hiring men at one dollar a day from the ranks of the unemployed, the city authorities accepting the services of these men and utilizing them for work upon various public improvements, chiefly in the parks. A census of Pittsburg, as we are informed by Mr. McGonnigle, of the "Association of Directors of the Poor of Pennsylvania," shows some six thousand families in need on account of lack of work, representing about 25,000 people.

The plan of the Central Committee has been to organize all the charities of the city, including the public department of charities, under one head, so that there will be no duplications and no overlapping, and so that all frauds shall be exposed, all vagrants sent to the workhouse, and all worthy persons provided for in some way. The leaders of the movement in Pittsburg are confident that by this plan they can provide for every case of extreme need. The citizens' organization has the Mayor of Pittsburg as president,

and its executive committee is composed of the most representative men, among whom, for example, is Mr. George Westinghouse, Jr. The chairman is Mr. William McConway, one of the leading manufacturers and most highly esteemed citizens of Pittsburg. It is expected to raise from \$75,000 to \$100,000 by popular subscriptions.

Mr. Bigelow, Chief of the Department of Public Works, is arranging to employ as many men as can be accredited to him. It happens that Pittsburg owns two large parks not as yet improved, in which work can be arranged for hundreds of men. In the selection of applicants for this public work, the committee has ruled that preference should be given to those who are *bona fide* residents of Pittsburg, and who have others dependent upon them, with no opportunity of employment in their usual vocations. Mr. McConway remarks: "Mistakes may in some cases be made in the selection of those to be employed, but this can only be a mistake in a degree. Any man willing to do such work at the rate of pay of one dollar per day—ten cents per hour—gives *prima facie* evidence of worthiness."

Mr. E. M. Bigelow, Director of Public Works, replied to the Committee as follows: "I would state that I can furnish work for two hundred in Highland Park on Monday, December 18, and also work for the same number in Schenley Park on Tuesday, December 19. After Tuesday I will gladly furnish work for all the men who may be employed by your committee. As the city is to be the beneficiary of the work without cost to it, engineers and firemen will be furnished by the Department of Public Works. I would ask that you furnish timekeepers for the men engaged by your Committee. I would also suggest that your Committee establish a headquarters where applications can be made, and where a card issued by it shall be given to each man employed which will entitle the holder to work." Mr. Bigelow's idea is that the Committee shall engage the men, keep their time and pay them, the money not going from under the control of the Committee; and the only connection the city will have with the movement is to furnish the work to be done, and the skilled men, such as engineers and foremen, to direct them. He also suggests that the Committee provide paymasters, who shall pay the men each day at the conclusion of their labor.

XII. THE SITUATION IN NEW YORK.

The only valuable inquiry into the magnitude and character of the distress existing in New York on account of exceptional lack of employment has been made under the direction of the University Settlement Society. The careful inquiries made by this admirable organization, especially in the crowded districts of the East Side, reveal a far more serious condition of things than had generally been supposed. The full extent of the distress can hardly be made apparent to the public until enforced idleness has run through a longer period. It is to be feared that in February and March the suffering may become ap-

palling. Meanwhile no large and adequate organization had existed for relief work up to the time this compilation of facts was closed on December 20, although steps had been taken to form a general relief committee, President Low, of Columbia, and leading members of the Chamber of Commerce taking a foremost part. The municipal authorities had not, apparently, learned that exceptional conditions of any sort exist, and had taken no part in the discussion and efforts of the early winter.

Very noteworthy, and highly valuable to the extent of its ability, has been the work of the East Side Relief Association under a strong committee led by such men as the Rev. Dr. Rainsford, President Charles Stewart Smith, of the Chamber of Commerce, and leading philanthropic workers, both Catholic and Protestant. The plan of the Association has been to employ men at one dollar a day in street sweeping in the tenement districts, from eighty to one hundred men being the average number thus far furnished with such employment from day to day. Another branch of the work of the Association has been a tailor shop, in which clothing is made for the destitute sufferers from the storms on the Southern coast, the clothing being distributed by Miss Clara Barton and the Red Cross Society. Furthermore, an establishment for giving work to women was about to be opened as this statement was written. The whole effort is conducted upon the most praiseworthy lines; and with money enough at its disposal this relief association could cope with a very large part of the situation in New York. The Charity Organization Society, in its measure, has rendered valuable aid, but it does not dominate the situation in New York as similar societies are able to do in many smaller cities. It maintains a woodyard in Twenty-eighth street, and there married men may earn fifty cents by four hours' work. The yard is not a large one and cannot, as now conducted, afford a very considerable outlet for the congestion of unemployed labor. The work of the Industrial Christian Alliance has developed rapidly under the superintendence of Mr. Arthur Milsbury, and its five cent restaurant is a very hopeful experiment. Of praiseworthy efforts by churches and various charitable societies and organizations, a long list might be mentioned, and each in its own way is helping to relieve the situation. But New York thus far is without any general organization, federating these numerous separate efforts, that is in a position to cope with the problem as a whole.

It should not be inferred by our readers that the cities whose provisions for relief have been explained in this article are by any means the only communities which have entered upon well organized and efficient measures. The list might easily be very greatly extended. Doubtless some of the most interesting and important experiments are in operation in towns and cities not mentioned at all in this statement. If the reports received from these other cities should seem to justify a return to the subject, another installment of information upon plans and results may be furnished in our February number.

RELIEF WORK,—ITS PRINCIPLES AND METHODS.

BY DR. WASHINGTON GLADDEN.

WANT and destitution are always at our doors, but they are upon us just now in stronger force than we have been wont to encounter. It is doubtful whether in any year of this century so large a proportion of the population of the United States has been unemployed and destitute. In most of our cities and towns numbers of workingmen can be found who have had little or no remunerative labor for weeks or months, whose savings are exhausted, whose credit is badly strained, and who are facing hunger and cold. "But these men have had good wages for a long time," it will be said; "why have they not a surplus in the savings-bank?" Some workingmen have a surplus, and they are fortunate; but the lack of a hoard is not a sure sign of unthrift. Many of these hard-working people have been trying to pay for homes, and all their savings, month by month, have gone into these investments; the interest and the taxes and the street assessments and the payments due upon their property are now a heavy additional burden; the fear of losing what they have saved is one cause of their present distress.

Among the destitute will be found a good many others, who, if not quite so thrifty as those of whom I have spoken, are yet industrious and self-reliant, and not at all in the habit of asking for alms. In every large town a considerable number of these industrious mechanics and laborers are now in very needy circumstances. A great many people are asking for help to-day who never before in their lives were compelled to seek assistance. The charitable societies of our cities find themselves confronted with an army of applicants; the overseers of the poor are overwhelmed by the burden thrown upon them; special relief committees have been formed in many places to meet the emergency.

It must not be supposed, however, that these applicants for aid all belong to the class which I have described. If this were so, the problem before the relief agencies would be a simple one. The great majority of these applicants are well known to the overseers of the poor and to the charitable visitors. They are chronic paupers; the names of many of them will be found on the books of the city authorities as recipients of relief last winter and for many previous winters. And even if their names have never appeared on these lists before, they may still belong to this class; for the population of all our cities is being largely recruited by the shiftless poor from the country. In all our cities a great deal of reckless charity is dispensed; and the opportunity of the mendicant is constantly enlarging. Thrifty country folk who have poor relations on their hands sometimes find it easier to maintain them in the city. I know a woman with a small family whose relatives in the country pay her rent, which is only three or four dollars a month; the city furnishes her coal; one of the benevolent societies supplies her with gro-

ceries; from one of the restaurants she gets broken victuals enough to feed herself and her children, and her clothing has been mainly provided by one of the churches. There appears to be no urgent reason why she should look for work, and she is not, apparently, anxious about the morrow. I dare say that her acquaintances in the country have heard how comfortably she is getting on, and that we shall see some of them moving in to try the same experiment. The number of those in our cities who expect to get a portion, at least, of their living in this way is steadily and rapidly increasing. And this class of persons is sure to come directly to the front in the present distribution of relief. The woman of many resources, of whom I have just spoken, found her way to the special relief committee of our city as soon as its doors were open. No matter what other income they may have, whether from earnings or from gratuities, people of this class will never fail to embrace any opportunity that is offered them of getting something for nothing. Like Dr. Eggleston's Hoosier economist, their motto is, "Git a plenty while your'e a gittin'." If they have employment by means of which they could earn a livelihood, the appearance of a relief fund is very likely to undermine their health.

The melancholy fact is that a free distribution of alms tends to weaken the self-respect and independence of many who have hitherto taken care of themselves, but who are living near the borders of mendicancy. The fact that food and fuel can be had for the asking is a temptation which some of the weaker ones will not resist. Many whose earnings have been somewhat reduced, but who might with frugality live upon them, are now coming forward with the rest to get their share of the relief funds. The most painful revelation to me of this winter's experience has been the willingness of those who have not hitherto been paupers to avail themselves of the public provision for the poor.

Such are the conditions which the relief committees must face. To some of them the problem must, I am sure, have already become disheartening. The difficulty of sorting out the chronic mendicants from the industrious and self-reliant working people is very great. Yet it is evident that the treatment accorded to the one class ought to differ radically from that bestowed upon the other. Measures which would be safe and wise in the one case would be mischievous in the other. We may admit that the mendicants, as well as the industrious poor, are entitled to our compassion; but there are different ways of expressing compassion.

The great need of all these people is remunerative employment. This is what the industrious ones want. Charity they do not want; it will be a bitter humiliation to them if they are compelled to take it; all they ask is the chance to earn their livelihood. The chronics also tell the same story, but a little in-

vestigation shows that their appetite for work does not amount to a craving; they always ask for it, but you soon discover that they could manage to get along without it if you should not happen to have any to offer them. We read of a Chicago professor, accompanied by a staff of student investigators, who passed through the serried ranks of the tramp brigade, reposing in the corridors of the city hall, questioning them as to their wants. They were unanimous, we are told, in expressing a desire for work. None of them preferred to beg. Really the question was superfluous. Nobody ever heard these people express any other sentiment.

The great army of applicants at the doors of the relief committee will all be asking for work, some because they hope to get it, and some with the strong hope that they will not get it. Both classes ought to have it—those who do not want it as well as those who do. We ought not to make the independent workingman take charity when he does not want it; we ought not to let the chronic mendicant have it because he does want it. Work is food for the one and medicine for the other; but the shirk needs the medicine not less than the honest man needs the food.

The problem, then, is to find work for the unemployed. And it is highly desirable that as much as possible of this work be furnished by individuals or firms or companies, acting independently and of their own motion. A large share of the unemployed in every city might be taken care of in this way if good people would only set their wits at work to find and furnish them employment. These idle people are not going to starve. There is food and fuel and shelter enough for them all, and they will not be allowed to perish for the lack of it. The only question is whether they shall receive this relief as earnings or as gratuity. It will cost the community no more to pay it to them as wages than to bestow it upon them as alms. But the economical and moral advantage to the recipients themselves and to the community of putting it in the form of wages is simply immeasurable. It is, therefore, the duty of every citizen to exhaust his ingenuity in inventing ways of furnishing work to persons whom he knows to be in need of it. These lines will fall under the eyes of many men and women of good will who know that they will be required to give during this winter some portion of their income for the relief of want. If all these would invent some way of spending this money for work, and would find some unemployed persons, male or female, who are suffering for the need of work, and would permit them to earn this money, a large share of the existing want would be immediately relieved. The problem of making work and of bringing the task and the toiler together is one that requires some thought and ingenuity, some trouble and pains, no doubt; but many of my readers can solve it, if they will give it half as much study as they will expend upon the costume for the next high tea, or the plans for the holiday vacation. Some job may be found in the garret or in the cellar; some work of repairing; some rearrangement of the store or the office; some ditching or plumbing or cleaning or painting; some new piece of

furniture that an idle cabinetmaker can construct for you; some renovation of the wardrobe with next spring's wants in prospect; it may be any one of a thousand things that wit can devise. I know a builder, with this end in view, who has begun the erection of a few houses. I know a gas company, which, for the same purpose, has put one or two hundred men at work laying mains in a part of the city not yet occupied. I have heard of many individuals who, on a smaller scale, have found and furnished work to the unemployed. Any one who will spend his money in this way will do about twice as much good with it as if he sent his check for the same amount to the charitable society or the relief committee.

The best work that the relief committee can do is that of an employment bureau in keeping classified lists of the unemployed, and thus co-operate with those who are willing to furnish work. Whenever it is possible this committee should organize some sort of industry—a wood yard, or stone pile, or laundry, or sewing room, by means of which all able-bodied applicants for aid should be enabled and required to pay by their labor for all that they receive. All honest and self-respecting applicants would vastly prefer to earn their bread, even by the most menial service, and those who are not willing to earn it in this way should be permitted to go hungry.

Whatever relief is furnished by the municipality should also take the form of wages for work. Fear of socialistic tendencies has restrained municipal authorities from making work for the unemployed, but it is difficult to see that paying people for work out of the public treasury is any more socialistic than supporting them gratuitously from the same source.

Serious practical difficulties will be found in the application of the work-test. Those benevolent individuals who undertake to assist their neighbors in this manner will sometimes be greatly disappointed and incensed by the response which is made to their overtures. Some of those to whom work is offered will be indifferent and unreasonable. Work which is provided in this way, at an unseasonable time and in anticipation of future needs, cannot, of course, be paid for at the highest rate of wages; the stipend must needs be small. A good many of those who are asking for charity promptly refuse work when it is offered them at low wages. Several men who had been subsisting for some time upon the charity of their neighbors have, to my knowledge, refused employment at a dollar and a dollar and a half a day. Such beggars should be permitted to choose starvation.

The rules of the trades-unions forbidding members to work for less than a certain wage must be relaxed in these times. The discipline of the trades-union is necessary; but there is reason in all things, and it is not rational to insist that men shall not work for less than a stipulated rate of wages, when there is no economic demand at all for their labor. If the trades-unions are able to support their members in idleness they have a right to do so; but they are hardly justi-

fied in saying to their neighbors, "You must either pay us two dollars and a half a day for our work or else support us by your charity."

It will not be possible to furnish work, this winter, to all who will need relief. That is the thing to aim at, and the nearer we can come to it the better. But the need is so unusual and so urgent, and the machinery of relief is in most places so new and inadequate, that we shall sometimes be compelled to give aid to those, whether willing or unwilling to work, for whom we cannot find employment.

The establishment of soup houses and charitable bakeries for the gratuitous distribution of food is the first impulse of many kind-hearted people; but experience proves that the injury outweighs the benefit. It may, however, be safe and wise to establish soup kitchens and cheap restaurants, where nutritious food can be sold at cost. The relief committees might establish such kitchens, in connection with their industries, and pay for their work in orders for food.

The relief committees will, of course, undertake some sort of investigation into the circumstances and needs of applicants. Those who are new to this business will imagine, at first, that they are getting, in a single hurried interview, the truth concerning the applicant; there will be evidence enough of poverty; and the explanation of it will be plausible; but after a few months' experience it will be clear that considerable acquaintance is necessary in order to deal wisely with most of these families. One of the facts most commonly concealed is the existence of relatives who are able to afford the necessary relief and who ought to be shamed into doing so. In many ways the relief committees will find the problem of helping these poor people becoming more and more difficult the longer they study it. Probably it will soon become clear to them that no temporary organization can dispose of the business which they have in their hands; and that there ought to be in every considerable town a thorough systemization of the business of charity. In some of our cities the business has been pretty well systemized, and these cities are much better prepared to meet this emergency than those in which no such organization exists. Yet even here the work of charity organization has been sorely crippled by the sentimental skepticism of multitudes. It has never been possible to convince a great many well-meaning people of the mischief wrought by indiscriminate and misdirected almsgiving. The attempt to combine the charitable workers in such a manner as to prevent the growth of pauperism is always resisted and ridiculed by a class of effusive philanthropists, who have very little practical knowledge of existing conditions. In cities where the charities are well organized, and where every case of want could be promptly attended to if the applicant were sent to the central office, the majority of the citizens still persist in giving to tramps and beggars at their doors. It is to be hoped that this winter's experiences may throw some light upon this matter, and that the peo-

ple of this country may come to some realization of the magnitude of the task which confronts them in dealing with the evil of increasing pauperism. It is to be hoped that in communities where the charities are already organized a more cordial co-operation of societies and churches and all philanthropic agencies may be secured; and that in communities where no such organization has been attempted the need of it will be clearly seen. For in dealing with this emergency a great many people are likely to discover that we are confronted with something worse than an emergency; that the acute disorder is terribly complicated with a chronic complaint; and that a thorough course of constitutional treatment is clearly indicated.

There is no room here to discuss the nature of the remedies. I think that they are likely to include:

1. The abolition of gratuitous, official, outdoor relief.

2. The care of the helpless and friendless poor, who are dependent upon the state, in infirmaries, hospitals, almshouses and orphanages.

3. The establishment of work-houses, to which all able-bodied and chronic mendicants should be committed, with interminate sentences. These incorrigible idlers and tramps need a thorough course of reformatory treatment. A work-house to which they can only be sent for brief terms of a few weeks or months is a doubtful good; they should be kept in confinement until their bodies, which are generally saturated with alcohol, are renovated and brought under normal conditions; until they have received some necessary industrial training, and until there is some fair assurance that they will become, if discharged, producers instead of parasites.

4. The provision of some kind of relief institution in every community, in which persons in temporary straits may obtain employment, and support themselves by their labor. It is vastly preferable, I think, that such relief institutions should be organized and managed by private charity; but, as I have already said, it is far better that the municipality should furnish work to able-bodied applicants for aid than that it should support them gratuitously for any length of time. The invariable rule of such relief institutions, whether under public or private management, should be to furnish work that is not particularly desirable, at low wages. The compensation offered should be distinctly less than is given for the same kind of labor in the market.

The thing to be aimed at is this: To enable every able bodied person to obtain the bare necessities of life by his labor; and to prevent abled-bodied persons from obtaining a living without labor. Our charities will not be properly organized until both these ends are practically secured.

When all this is done there will still be ample scope for Christian benevolence in ministering to the sick, the infirm and the helpless poor, who ought not to be permitted to become a charge upon the state, but should be cared for in their own homes.

LORD AND LADY ABERDEEN: A CHARACTER SKETCH.

BY W. T. STEAD.

I. THE MIST OF CENTURIES AND OF SONG.

WHATEVER grudge the New World may bear the Old, for its heritage of ill, it cannot complain that it is stunted in the counterbalancing dower of reminiscences of its romantic past. In the midst of the metallic clink of the coin on the counter and the eager babel of operators in the markets, echoed and magnified by the journalistic sounding boards of the press until the atmosphere seems vocal with dollars and cents, can be heard now and then stray notes of melody from out, "the purple past, the dusk of centuries and of song." These wandering echoes of the clarions of the bygone time come and go like the breath of the zephyr on the Æolian harp. Sometimes it is a name, a place, a date or a person which unloosens the latent music of the world, but whenever it is heard it carries us back in imagination to the vanished centuries which poet, novelist and historian have irradiated with their genius, until they glow with the splendor with which the dawn illumines the Eastern sky.

The name of the present Governor-General of Canada is one of the keys which unloose these chords of the fairy music of old romance. When I was in Chicago the boardings blazed with the ornate posters announcing that a popular actor would shortly appear in one of the theatres of the city in his famous impersonation of Richard the Lion Heart. To-day there lives in the Government House at Ottawa, the direct lineal descendant of the warrior whose arrow slew King Richard before the castle of Charles in Perigord. A chasm of seven centuries yawns between the fatal shot of Bertrand de Gourdon and our own day, but it is bridged by the history of a single family; and the sighing of the Canadian wind amid the pines seems to bring with it far-away echoes of Blondel's song and the fierce clash of Christian sword on Moslem helm in the Crusaders' war. The legendary origin of the Gordons of Haddo, of whom Lord Aberdeen is the living representative, does not lose its value from our present point of view because its authenticity is a subject of antiquarian dispute, or because there are authorities who trace the Gordon genealogy much further back than the days of the lion-hearted Plantagenet. Antiquaries question everything, and if the Gordons were in Aberdeen before the Norman William conquered England, that in no way detracts from the romantic interest that associates their name with the tragic fate of one of the few English monarchs whose story has become an heirloom of the world of old romance.

If the family history of Lord Aberdeen recalls the

ancient glories of the Plantagenets, that of Lady Aberdeen revives memories not less glorious, in the opinion at least of one great branch of the English-speaking world. The Governor-General is a Gordon of Scotland, but his wife claims descent not only from the ancient kings of Scotland but also from those of Ireland through the O'Neills of Tyrone. To the Anglo-Saxon, Irish history is very much of a sealed book. To an Irish patriot it is like those illu-

LORD ABERDEEN.

minated manuscripts which still attest, in European museums, the glory of Celtic art and the ancient splendor of the Irish race. And among the heroes whose exploits furnish the illuminations to the gilded page, the O'Neills occupy a leading place. They were, it must be admitted, no friends of the English. Nor, indeed, was it possible for them to regard the invader as other than the common enemy of their family and of their race. Had there been a few more O'Neills in Ireland, the course of the history of that distressful isle might have been very different. But the axe and sword and musket thinned their ranks, and although the story of the O'Neills is as fuel for the brooding imagination of the patriot, it resembles all other Irish histories in its record of unavailing valor and of the pathos of despair. In these later days, however, the cause of Irish liberty and Irish nationality has found a repre-

sentative in Lady Aberdeen, who from her position in the inner arcanum of British rule may be able to do more for her country in the council chamber than any of her stalwart ancestors were able to achieve for Erin in the tented field.

Apart from the associations of legend and of romance that cluster round the family history of the Governor-General and his wife in the dim twilight of the remote past, it is interesting to note that the associations between the Gordons and the American continent date back for two centuries, to a period antecedent to the great schism by which George the Third rent the English-speaking world in twain. John Gordon, of Haddo, was created a baronet of Nova Scotia by Charles Stuart, King of England, and the baronetcy is one among the many titles borne by the Earl of Aberdeen.

Sir John Gordon was a Cavalier of the school of Montrose. When the Scottish people were signing the Solemn League and Covenant with their heart's blood Sir John was fortifying his castle and sharpening his sword, and mustering his fighting men to help the King to govern by right divine. The fates and the Scottish people were, however, too much for Sir John and for his royal master. When the Marquis of Argyle besieged him in his castle of Kellie his Scottish artillerymen, having no stomach for the cause, deserted to the army of the Covenant and Sir John was compelled ingloriously to surrender. There was short shrift in those days for the vanquished. Sir John Gordon was carried as a prisoner to Edinbro, and in the same month of July that Oliver Cromwell on the moor of Long Marston gave the royal army the foretaste of the quality of his Ironsides Sir John Gordon was judicially condemned to death and publicly executed. The lesson was a severe one, but the effect seems to have been most salutary. From that time to this, although his descendants may have described themselves as Royalists, Jacobites or Tories, they have always been true to the cause of liberty, of justice and of progress.

Of this a more conspicuous example was afforded in the person of the first Earl of Aberdeen. Five years after the first Nova Scotian baronet went to the headsman's block the axe of the executioner was employed on the neck of Charles Stuart, but after a time the whirligig of time brought about its revenge, and the son of the beheaded king, having come to the throne, made the son of the beheaded baronet first Earl of Aberdeen and Lord High Chancellor of Scotland. Argyle went to the scaffold, and the Cavaliers, once more in the saddle, pursued their old enemies without ruth. They found, however, that their Lord High Chancellor brought too much conscience to his work to serve as the tool of mere proscription. The Privy Council, finding some difficulty in striking at the heads of some of the Whigs, issued orders that husbands and fathers should be held responsible by fine and imprisonment for the opinions of their wives and daughters. Lord Aberdeen, to his credit be it spoken, declared from the judgment seat that the orders of the Privy Council could not be carried out under any

existing law. Then speaking as Minister he declined to propose any alteration in the law to enable this monstrous iniquity to be legalized. The Stuarts were a stubborn race, and instead of recognizing the justice and integrity of Lord Aberdeen, the King drily ob-

LADY ABERDEEN.

served that he would be served in his own manner and according to his own measures. Lord Aberdeen at once resigned. He was too loyal to the dynasty to consent to serve King William when James was sent packing across the seas, and he spent

the rest of his life in retirement. He was, however, sufficiently free from Jacobitism to take the oath of allegiance when Queen Anne came to the throne. He was said to have been the solidest statesman in Scotland, the first of a line of which the present Governor-General is no unworthy representative.

It would be a mistake, however, to imagine that the Aberdeens descend solely from the conservatives or aristocrats of the world. Lady Aberdeen owes her family name of Marjoribanks to the grant of certain lands made by King Robert the Bruce to his daughter, Marjorie, who married the High Steward Johnstone, whose family in time substituted the name Marjoribanks for their own more prosaic one. But not only is Lady Aberdeen associated by her ancestors with the patriot hero of Scottish history, there is in her family story one of the most romantic incidents which occur seldom far from that mystic borderland of old romance which divided England from Scotland. Among her ancestors she counts the famous Grizel Cochrane, whose reckless daring saved her father's life. It was in the last years of King James' reign and Grizel's father, Sir John Cochrane, of Ochiltree, was lying in Edinbro under sentence of death. All efforts to secure his pardon failed. The death warrant, signed in London, was forwarded by mail to Edinbro; on its arrival Sir John was to die. Despair gives courage to the most timid, and Grizel Cochrane, seeing that there was only one chance left, seized it with intrepidity. Disguising herself as a highwayman she waylaid the Royal mail, and clapping a pistol to the driver's head compelled him to give up the death warrant. As soon as she possessed herself of the fatal document she rode off and soon had the pleasure of thrusting it into the fire. Whether out of consideration for the heroism of the exploit or because of the Revolution is not stated, but Sir John was ultimately pardoned.

Lord Aberdeen also boasts a Grisell among his ancestors, who, by the way, makes him a direct descendant of John Knox. Among all men born on Scottish soil there is none greater or more universally esteemed than the great Reformer. Lady Grisell Baillie married the son of Robert Baillie, the martyr, who was John Knox's great grandson. Lord Aberdeen's grandmother was Lady Grisell's great granddaughter. Robert Baillie was one of the martyrs for Christ's Crown and Covenant, whose sufferings have done so much to glorify the history of Scotland and to dignify the Scotch character. It is a very pretty story, that of Lady Grisell and of her visits to the martyr as he lay in the Tolbooth waiting for death. It has features which suggest that Grisell was the original of Robert Louis Stevenson's latest heroine. Grisell played her part faithfully and nobly. She could not save Robert Baillie, but her heroism and beauty won the heart of his son George, whom she married after the Revolution of 1688 had made it safe for honest folks to marry and be given in marriage. Lady Grisell was a poet as well as a heroine, and fragments of her minstrelsy to this day enliven the hours of the Scottish peasants.

II. THE PRIME MINISTER.

The most notable name among all the ancestors of the Governor-General is that of his grandfather, Earl of Aberdeen, Prime Minister of the Queen in the middle of the present century. How great and good, how ideally perfect a character he was has but recently been revealed to the world. In the useful and interesting series of the Queen's Prime Ministers which Mr. Stuart Reid is editing the most interesting volume is that which Sir Arthur Gordon has devoted to the story of the Earl of Aberdeen. It is a narrative which tends to deepen and reassure our faith in human nature, and especially in the native virtues of the English-speaking race. The discovery of a great personality is to the historian what the finding of a nugget is to the miner who is prospecting for gold. To come upon a pure lump of metal lying in an out of a way place is of much more importance than the intrinsic value of the particular nugget. Its importance arises from the fact that it suggests the presence of other nuggets of equal value which have not yet been discovered, but may be revealed in that gold-bearing stratum. You rise from the perusal of Sir Arthur Gordon's monograph feeling that the world, and especially the British public, is richer in human worth and almost ideal goodness than you suspected before you turned over its pages.

Lord Aberdeen as Prime Minister closed his official career amid the dark clouds and sombre discouragement of the Crimean War. Owing to that unfortunate circumstance by which he was overwhelmed in a catastrophe that he had in vain endeavored to avert, his real merits as a statesman were overshadowed, and it was not until his son's biography appeared that men began to appreciate the greatness of Lord Aberdeen as an imperial statesman. The memory of such a man and the story of the services which he was able to render the Empire is a perpetual incentive to his grandson, whose shoulders are not unequal even to the burden of the heritage of so great a name. Lord Aberdeen before he was 30, had to play a part in the history of Europe which is without a parallel. He was sent as special emissary from England to the camp of the allies when coalesced Europe was rising to throw off the tyranny of Napoleon. During the whole of the campaign which culminated in the Battle of Leipsic and the triumphal entrance of the allies into Paris Lord Aberdeen was the intimate adviser and trusted confidant of the Emperor of Austria and of most of the crowned heads of Europe. Seldom had a young man so great a rôle to play, and seldom has any one fulfilled so difficult a part with so brilliant a success. Nature and education had alike fitted him for the position. A rare scholar, familiar with modern languages, at home equally in court and camp, of a transparent sincerity and simplicity, which enabled him to command the confidence of the sovereigns and statesmen with whom he was thrown into constant contact, Lord Aberdeen contributed as much as any man to the success of the great European revolt against Napoleon. In his son's pages we catch glimpses from time to time of this high spirited, chiv-

alrous Englishman living in the midst of alarms of war and in the very vortex of the intrigues of half a dozen rival courts without ever betraying the confidence of a friend or sacrificing for a moment the interests of his country. Had he done nothing else Lord Aberdeen would have conferred an inestimable service upon the cause of liberty and national independence by the part which he played in that campaign.

The Gordons have often distinguished themselves in early life. One of the same family fell on the field

GEORGE GORDON, FOURTH EARL OF ABERDEEN.
Memorial Bust in Westminster Abbey.

of Waterloo a Lieutenant-Colonel and a K. C. B., when he was only 23 years old. Lord Aberdeen had been taught statesmanship as a boy at the table of Pitt and Melville, in whose homes he had spent his youth, and who had besides inherited a great tradition of public service broken only by a single link. He had, moreover, been steadied by the responsibilities of the management of his estate at a time when other young men have barely left the university. This, however, is not the place for telling the story of Lord Aberdeen, the Prime Minister, excepting so far as it bears upon the prospects of Lord Aberdeen, the Governor-General. As Foreign Minister, as Colonial Secretary and as Prime Minister, Lord Aberdeen

had as much opportunity as any living man in shaping the policy of England, both in Colonial affairs and on the continent of Europe. It is interesting to note, in view of the position which his grandson holds to-day, that the most conspicuous feature of his administration of colonial affairs during the short time he was at the Colonial Office was to draw up instructions to Lord Amherst, whom he proposed to send as High Commissioner to Canada with powers not only to investigate but to settle in the most liberal manner the grievances of the colony. Although Lord Aberdeen was a Conservative and Foreign Minister of the Duke of Wellington, he always set his face as a flint against the doctrine favored by Lord Palmerston of interfering in every possible way short of military force in the affairs of other nations. In like manner, although he was a peer and a member of the permanent majority in the House of Lords he opposed without hesitation what he considered the Duke of Wellington's dangerous policy of throwing out the measures of the Reform Administration. Notwithstanding this, the leadership and management of the Conservative party in Scotland was forced upon him by the Duke of Wellington and Sir Robert Peel, who assured him that he had become "the standard of our colonial policy as you were before of our foreign policy." Despite his preoccupation with foreign affairs, he was statesman enough to see that the destruction of the Scotch Church was inevitable unless action was taken to promptly meet the demands of those who subsequently constituted the Free Church of Scotland. His advice was disregarded until it was too late.

During his second term of office as Foreign Secretary it fell to his lot to arrive at two important decisions of vital importance to the Dominion over which his grandson is now presiding as representative of the Queen. When he entered office the relations with the United States were somewhat dangerously strained owing to frontier difficulties and Canadian troubles. He sent Lord Ashburton to Washington on a special mission to adjust the difficulties between the Empire and the Republic. The frontier line which secured British Columbia for Britain was Lord Aberdeen's handiwork. Lord Aberdeen had proposed in the first case to refer the disputed question to arbitration. But President Polk took a high line on the subject and declared that the rights of the United States to the territory in dispute were so clear and unquestionable that he was determined to take active measures to vindicate American rights. Lord Aberdeen was the last man in the world to deal in bluster, but he was not to be bluffed by the President, and in the House of Lords he stated that Britain also had rights in the disputed territory which were clear and indisputable, and these rights, with the blessing of God and their support, he was fully prepared to maintain. After this preliminary defiance on each side, a compromise was drawn up by Lord Aberdeen, and ultimately approved of by the American Senate. By this means British Columbia was secured to the British Empire. But although Lord Aberdeen was very

vigilant in maintaining the rights of Britain he had no aspiration to extend British territory even where he was invited to do so. It is not generally known that it is owing to Lord Aberdeen's recognition of the fact that the Pacific Slope of California was part of the natural heritage of the United States of America that the British flag is not flying at this moment over the Golden Gate. When the annexation of Texas brought the United States to the verge of war, the Mexican government offered to cede California to Great Britain. Lord Elenborough, then First Lord of the Admiralty, strongly urged upon his colleagues the importance of accepting the offer. "Let us obtain possession," he cried, "while we can, of the key of the northwest coast of America." His arguments produced some effect upon Sir Robert Peel, then Prime Minister, but Lord Aberdeen set his face as a flint against the scheme. However tempting a bait San Francisco might be to a power which had the onerous naval responsibilities of Great Britain, he peremptorily refused to permit the acceptance of an offer which would have been considered as an unfriendly act to the United States, and which might not improbably have landed the Republic and the Empire in hostilities. Such a possibility might be faced in maintaining existing rights, but nothing could justify risking such a disaster in order to establish British authority where it had not previously existed. Sufficient has been said to show that Lord Aberdeen, the Prime Minister, recognized the necessity of maintaining a good understanding between the United States and the British Empire to induce him to swerve a hair's breadth from the policy which he recognized as both just and expedient.

After the repeal of the Corn Laws, which Lord Aberdeen strongly supported, the Peel administration fell, and on the fall of Lord Derby's Government Lord Aberdeen became Prime Minister of the Queen, a post which he afterwards resigned under circumstances as honorable to him as it was discreditable to some of his colleagues. Her Majesty accepted his resignation with unfeigned regret. She immediately gave him the vacant Garter, and wrote him a letter which is worth while introducing as indicating the kind of relations which existed between the Sovereign and her Prime Minister.

WINDSOR CASTLE, February 7, 1855.

Though the Queen hopes to see Lord Aberdeen in a short while, she seizes the opportunity of approving the appointment of the Hon. and Rev. Arthur Douglas to the living of St. Olive's, Southwark, to say what she hardly trusts to do verbally, without giving way to her feelings. She wishes to say what a *pang* it is for her to separate from so kind and dear and valued a friend as Lord Aberdeen has ever been to her since she has known him. The day he became her Prime Minister was a *very happy* one for her; and throughout his ministry he has ever been the kindest and wisest adviser, one to whom she could apply for advice on all and trifling occasions even. Thus she is sure he will ever be—but the losing him as her first adviser in her Government is *very painful*. The pain has been to a certain extent lessened by the knowledge of *all* he has done to further the formation of this Government in so loyal, noble and disinterested a manner, and

by his friends retaining their posts, which is a *great security* against possible dangers.

The Queen is sure that the Prince and herself may ever rely upon his valuable support and advice in all times of difficulty, and she now concludes with the expression of her warmest thanks for all his kindness and devotion, as well as of her unalterable friendship and esteem for him, and with every wish for his health and happiness.

Mr. Gladstone at the same time wrote a letter of sympathy, saying that he never regretted having urged him to accept "the seat of power, to which he had a paramount claim, conferred by superior wisdom and virtue." On his resignation Lord Aberdeen remained in retirement. He kept up the relations which existed between him and his monarch and continued to bring to bear upon all questions his keen, impartial judgment, which made his counsel so valuable to statesmen of both parties. Lord Aberdeen never quite forgave himself for his share of the bringing about of the Russo-Turkish war. His one cause of regret, he wrote in 1857, was that he did not at once retire, instead of allowing himself to be dragged into a war which, though strictly justifiable in itself, was most unwise and unnecessary. So deeply did he take it to heart that he refused to rebuild the parish church of Methlick. He said he would leave the work for his son. No one knew why he refused until after his death, when it was found that he shrank from building a church owing to the share which he had in the Crimean War. The suggestion came to him from the text in the Book of Chronicles: "And David said to Solomon, My son, as for me it was in my mind to build an house unto the name of the Lord my God; but the Word of the Lord came to me saying, Thou hast shed blood abundantly, and hast made great wars; thou shalt not build a house unto my name, because thou hast shed much blood upon the earth in my sight."

Her Majesty visited him in 1857 at Haddo House. Three years afterwards he expired in London, leaving a memory of a singularly stainless career marred by no selfish or unworthy trait. No man was less of a self-advertising politician. A ripe scholar, a sagacious statesman, and a profound and prescient thinker, he constantly displayed an unshaken courage in maintaining the principles to which he was attached and defending what he believed to be true against all odds. Few British statesmen have had a greater position and a larger share in the shaping and molding of their country, and none have ever emerged from the ordeal with a higher reputation for a love of justice and an unshaken devotion to the cause of peace.

In many respects the Governor-General of Canada reminds one of his grandfather. In one respect he differs from him. The Prime Minister was so reserved that his real character was only known to his intimates. His grandson is affability itself; his urbanity, his courtesy, and his general amiability enable him to be sympathetic with all sorts and conditions of men; indeed, he has almost carried matters to the other extreme. The grandfather hid his natural kindness behind a mask of almost forbid-

ding reserve. So far from wearing his heart upon his sleeve, he hid it behind a somewhat cold and stern exterior. The world thought him proud and unsympathetic and therein did him an injustice. With the grandson the misunderstanding lies on the other side, his ready sympathy, his absolute forgetfulness of self, his natural bonhomie, are apt to lead those who do not know him to forget that beneath all this extreme geniality of demeanor there is concealed a strong character all the more resolute to carry out its end because it is extremely indifferent as to the mere formalities of ceremony and etiquette.

The fifth Earl of Aberdeen, the son of the Prime Minister, better known as Lord Haddo, whose memoirs, written by the Rev. E. B. Elliot, of Brighton, has long been a favorite biography among Evangelicals. The work passed into a sixth edition twenty years ago. Lord Haddo was an invalid, whose last years were spent in the constant presence of death. He took but slight interest in politics, although he was a member of the House of Commons. He threw his whole soul into the work of evangelization. He preached, he taught, he distributed tracts and Bibles, built churches and generally laid himself out to promote as much as in him lay the coming of the Kingdom. He was singularly free from the besetting sin which characterizes most persons of a pronounced evangelical piety. He was not intolerant, and his influence was ever exerted to break down the barriers of sect and the differences which separated good men.

On his death, at the early age of 47, he was succeeded by the sixth Earl of Aberdeen, the elder

brother of the present Governor General. His singular career was one among the many links which unite the Aberdeens with America. Two years after he had succeeded to the earldom, thinking that the resources of the family had been somewhat drained by the generosity of his father and by the necessity of providing allowances to its younger members, he suddenly arrived at a strange decision, to which he was, doubtless, also prompted by an innate love of adventure and passion for a seafaring life. Abandoning his princely domain at Haddo, he crossed the Atlantic, and after a short tour in the United States, abandoned his name and rank at Boston and shipped himself as a sailor on board a merchant ship which was bound for the Canary Islands. No one on board knew him as an earl; they only knew him as George H. Osborn. He was over 6 feet high, handsome, full of the natural courtesy of a great nobleman, but he served in the fore-castle as if he had been an ordinary seaman. He was enthusiastic about navigation, and passed in the Nautical College at Boston as first-class navigator and second class for seamanship. He had not been long enough at sea to secure a captain's certificate until the next year. He sailed as mate in an American coasting vessel, but shortly afterwards we find him again as an ordinary seaman making a voyage to Mexico. For the next three or four years he continued to earn his living before the mast. On one occasion a ship in which he was sailing visited the colony where his uncle, afterwards Lord Stanmore, was governor, but he never made himself known, although it is said that one day he wrote his name on a pane of

AFFARIC LODGE, LOCH AFFARIC, BEAULY.

glass in the governor's residence. Between his voyages he lived for the most part in Maine. He seems to have been very happy. He was a rigid teetotaler, and took an active part in religious exercises, both on ship and at home. During the whole of his sojourn in America the fifth Earl only drew £200 from the revenues of his estates, nor did his mode of living differ from that of an ordinary seagoing man. In 1870 he started to make a voyage to Australia, hoping from there to complete the circle round the globe. Six days, however, after he left Boston he was caught by the bight of the down haul as he and his companion were lowering the mainsail. Lord Aberdeen was caught by the rope and thrown into the sea. His companion heard his cry for help as he dropped into the water, but he was never seen or heard of since. His death when serving as first mate on board that American ship brought about the accession of the present earl, John Campbell Gordon, who was the youngest son of Lord Haddo, and to whom this sketch is more particularly devoted.

It was necessary to dwell at much greater length than usual upon the character of Lord Aberdeen's ancestors. The Governor-General is the resultant of the very varied and strangely marked features which make up the sum of the Gordon character. There are in him many of the salient traits of the more notable of his forbears. He has the administrative genius and statesmanlike ability of the Prime Minister, the earnest piety and catholic evangelism of Lord Haddo, while he is by no means devoid of the love of action and adventure which were so strongly developed in his brother George. Although he resembles many of his ancestors he has a distinct character of his own, which will be better appreciated both in Canada and the United States four years hence than it is now.

III. THE EARL OF ABERDEEN.

John Campbell Gordon, sixth Earl of Aberdeen, was born in 1847, just before the great revolutionary outburst which shook the thrones of Europe. He is, therefore, 46 years of age, but does not look more than 36. He has a singularly youthful appearance, and in this he resembles Lord Rosebery whose juvenility of aspect has frequently occasioned remark, and which for some time stood in the way of the recognition of his qualities even by so familiar a friend as Mr. Gladstone. Lord Aberdeen was only a younger son till 1870, when the death of his brother George gave him a seat in the House of Lords and brought him in sight of the career which up to the present moment has been one long progress of increasing service to the State. The Gordons are physically a fine race, and the present Earl, although not so tall as his brothers, is much stronger in muscular development than might be imagined from those who note his comparatively slight build. Like most men of his family, he is extremely fond of sport—physical exercise. Both of his brothers were splendid shots with the rifle, having carried all before them at Wimbledon on more than one occasion. It was this extreme devo-

tion to the rifle which led to the lamentable accident which caused the death of his second brother.

Lord Aberdeen, however, unites with the love of sport which is common to most landed aristocracy a passion which among peers is almost unique—from boyhood he has had a delight in locomotive engines: he is probably the only peer who could drive an engine from London to Edinburgh. Through the indulgence of a relative, when he was still a schoolboy he had permission to ride on the engine of a local railway and he never, if he could help it, rode anywhere else. He had no greater delight than to stand in front of the fire-box acting as fireman or starter and occasionally being permitted to drive the engine. He still remembers as one of the proudest days of his life how, when he had finished oiling the engine when at full speed, the old engine driver said to him: "John, I think I must apply for a day's holiday and let you take charge." From that time forward Lord Aberdeen has never lost touch with the locomotive engineers; no one is more popular with the railway servants in the old country and nothing but the lack of acquaintance with the road and the signals stands in the way of his being able to take a Canadian Pacific express right across the whole continent from the Atlantic to the Pacific. He is certainly the first Governor-General who was also an engine driver. Engine driving, in fact, may be considered as one of his favorite hobbies, and one of the things which he looked forward to in the new world was that of making a study of the engines of America, as complete as that which he has made of the locomotives of England and Scotland. It was this boyish passion which first introduced him to public life. Lord De la Warr had moved for a select committee into railway accidents and in support of his motion Lord Aberdeen, who a very young man, made his maiden speech in the House of Lords. There is no more difficult audience to address than the Peers, but his knowledge of the subject and the enthusiasm with which he explained the technicalities of railway management and the mysteries of fly-shunting to the Peers won him high praise, and when at a later period a Royal Commission was constituted in order to inquire into railway accidents he was immediately nominated as a commissioner. Of this commission the Duke of Buckingham was the first chairman, but on his appointment to the Indian presidency, Lord Aberdeen, although one of the youngest members of the commission, succeeded him as chairman. It was a remarkable elevation for so young a man and one of which he made the most to the interest of the railway servants. The Commission reported in favor of the block system, continuous brakes, continuous foot boards, and of many other improvements which the railways have for the most part introduced of their own accord. As the commission was not unanimous Lord Beaconsfield shirked the duty of legislation. Few questions are of more importance in the New World than that of reducing the unnecessary slaughter of railway employees, which in the United States attains dimensions far in excess of that of any other civilized country.

There is probably no man west of the Atlantic with whom those who are working in this matter could more properly take counsel than the Governor-General of the Dominion of Canada, whose sympathies with the workmen are by no means circumscribed by parallels of latitude or mountain range or sea.

Lord Aberdeen's second appointment was somewhat similar, inasmuch as it concerned the prevention of the loss of life on the part of the working population. The agitation initiated by Mr. Plimsoll concerning the wholesale destruction of sailors' lives by the sending of coffin ships to sea, in order to realize a profit for the owners, led to a prolonged and angry controversy, in which Mr. Chamberlain, who was then President of the Board of Trade, took a very strong line against the ship owners. After considerable recrimination, during which feeling on both sides became extremely heated, it was at last decided to appoint a Royal Commission on which both parties could be represented to take evidence and report. The Commission was a strong one. Mr. Chamberlain was one of its members, and the leading representatives of the ship owners were also there in force. It was no easy task presiding over a tribunal in which the chief disputants sat as judges, and it was a singular tribute to the rapidly rising reputation of the young Earl that he was selected as chairman, a position which somewhat resembled that of Æolus in the cave of the winds. However, by the judicious dining of the Commissioners before they commenced the inquiry, and the excellent practice of lunching together during the course of the inquiry, Lord Aberdeen was able to establish sufficiently genial relations with the Commissioners to get through with a singular absence of friction. His position as chairman was largely official and appeal was constantly made to him by the advocates of the respective sides to rule out of order this, that or the other question. He was almost the youngest man on the Commission, and his courtesy and amiability might have led some of the ruder Commissioners to try to get their own way with a rough hand. Whatever attempts were made in this direction miscarried signally, and the Commission had not been many days in session before its members recognized that although its president had a glove of velvet there was within it a hand of steel. When he had to vacate the chair in order to undertake the responsibilities of the Irish Viceroyalty, the Commissioners, on the motion of Mr. Chamberlain, passed a unanimous vote expressing their high sense of the signal impartiality and *savoir faire* with which he had discharged the arduous duties of his office.

Up to this time the Earl of Aberdeen, although acting in hearty accord with Mr. Gladstone, who had always been a close personal friend of all the Aberdeens, and especially of the present Earl and Countess, had not held any purely political post under the Liberal Party. Lord Aberdeen, the Prime Minister, began life as a Conservative. He was first employed by Lord Castlereagh, and was subse-

quently Foreign Minister of the Duke of Wellington and Sir Robert Peel. When the Corn Laws went by the board he became a Peelite, and the Aberdeen Ministry was a combination of Peelites and Liberals, hence when the present Earl took his seat in the House of Lords he sat neither with the Conservatives nor with the Liberals, but occupied a place in the cross benches, which is supposed to belong to peers of an independent mind who do not wish to identify themselves conspicuously with either of the two parties. He was regarded, however, as belonging to the Conservative Party by heredity, and hence in 1876 he was selected to move the address to the Queen in reply to the royal speech. Even then he gave an indication of how loosely he regarded the party tie by taking occasion to express his objection to the Royal Titles bill, a measure which was strongly supported in august circles.

It was soon evident, however, that the popular sympathies of the young Earl and the immense personal influence of Mr. Gladstone, who had always been as a father to the Earl and the countess, were sweeping him directly into the Liberal ranks. In addition to this, two influences, of different degrees of importance, were telling in the same direction. One was the influence of his wife, who was strongly Liberal, and the other the natural reaction against the follies and courses of the Jingo period which marked the close of Lord Beaconsfield's administration. His first overt act of rebellion against his party was when he telegraphed from Brindisi his adhesion to the popular protest which was being signed against the Afghan War. That this was no mere caprice he made abundantly evident when he spoke in the debate against the Afghan policy of the Ministry, thereby maintaining the traditions of his ancestor in his devotion to peace and conciliation. In 1879 he indicated his transference of political allegiance by supporting Mr. Gladstone's first Midlothian campaign, having accepted Lord Rosebery's invitation to form one of the house party at Dalmeny on that memorable occasion. The following year, on the very day on which Lord Beaconsfield dissolved Parliament, Lord Aberdeen took his seat for the first time on the Liberal side of the House. He had burned his boats and definitely cast in his lot with Mr. Gladstone on the eve of an election which, in the opinion of society, was certain to result in the return of Lord Beaconsfield to power. Society, as usual, was wrong, the elections went with a rush against the Jingoës, and Lord Aberdeen found himself embarked on the winning side.

The only appointment which he received from the Government of that day was the chairmanship of the Commission on Shipping, to which I have already referred. It should be mentioned, however, that Lord Aberdeen was, during these years, entrusted with the duty of acting as Lord High Commissioner to the Church of Scotland. The Lord High Commissioner is the representative of Her Majesty and he must be present at the opening of what may be called the Par-

DALMENY, MIDLOTHIAN CAMPAIGN, 1879.

Marquis of Tweeddale.	Hon. Alfred Lyttleton.	Countess of Rosebery.	Mr. Edgar Boehm.
Lord Reay.	Earl of Aberdeen.	Miss Mary Gladstone.	Mr. Lacaitu.
	Marchioness of Tweeddale.	Mr. Gladstone.	Countess of Aberdeen.
	Mrs. Gladstone.	Lord Douglas Gordon.	Mr. Adam, (Chief Opposi- tion Whip).
		Earl of Rosebery.	

liament of the Scotch Church of Edinburgh. In this capacity Lord and Lady Aberdeen held almost royal court at Holyrood Palace. This was a kind of preliminary apprenticeship qualifying them for their subsequent viceroyalty in Dublin and their Governor-Generalship in Canada. Lord Aberdeen in this and other positions which he filled in the cause of philanthropy and religion had proved that he not only possessed capacity, but also that his capacity was recognized and appreciated in the most influential quarters. Hence no one was astonished, unless it was the Earl himself, when, on the formation of the Gladstone ministry of 1886 he was sent for by the Prime Minister and offered the Viceroyship of Ireland. Lady Aberdeen was at Mentmore with Lady Rosebery at the time, when she received a telegram from her husband saying he wished to see her at the railway station that night on her return. To her immense astonishment she learned that her husband was going to Dublin Castle.

In the course of the morning a message had arrived summoning Lord Aberdeen to Mr. Gladstone's house.

As soon as he arrived Mr. Gladstone told him that he must go to Ireland. At that time nothing in the world was further from Lord Aberdeen's mind. He was a Scotchman who had never paid any particular attention to Irish affairs. Mr. Gladstone was forming his ministry with Home Rule as his principal; in fact, its only article of its programme. The position of Irish Viceroy was, therefore, one of the most important in the whole administration. Lord Aberdeen hesitated to accept so responsible a position without time for consideration. But it seemed that political exigencies rendered it indispensable that the Viceroy must be appointed there and then, otherwise it would have been impossible for Mr. Morley to have taken office as Chief Secretary, and every hour of delay was of importance. And the old gentleman, when, in addition to being Prime Minister of the Queen, he feels himself to stand in *loco parentis* to a young politician, has about him a kind of parental imperativeness which it is difficult to resist. Therefore, Lord Aberdeen, being crowded into it, as it were, by Mr. Gladstone, found himself suddenly Lord of Dublin Castle,

as Viceroy of her Majesty under the first Home Rule administration which had existed in Great Britain.

The situation in Dublin when Lord and Lady Aberdeen began their viceroyalty was almost one of unexampled difficulty. Lord and Lady Carnarvon, who had been their predecessors in the Castle, had shown their appreciation of the Irish character and disposition by dispensing with the menacing machinery of military escorts and had thrown themselves heart and soul into the work of promoting the material interests of Ireland. Unfortunately, Lord Carnarvon's statesmanlike projects for the pacification of Ireland met with but scant sympathy from Lord Salisbury. The situation between the Castle and Downing street had been aggravated by the reactionary policy of the Ministry until at last in despair Lord Carnarvon resigned, and when on his way to London received the news of the fall of the Ministry. Mr. Gladstone came in. Without the Home Rulers he had no majority in the House of Commons. He, however, declared himself in favor of Home Rule, hoping to make up on the Irish vote the defections which he knew he would have to expect on the part of the Whigs and Radical Unionists. The Irish, although delighted at the demonstration which this afforded of the power of their Parliamentary vote, were sullen and suspicious. They had had but too recent an experience of what they called the Grand Old Coercionist for them to trust Mr. Gladstone further than they could see him. Most of the leaders of the men upon whose shoulders he was now returning to power had been imprisoned by him during the administration of Mr. Foster or Lord Spencer. Men who have just come out of jail are inclined to apply the maxim about doubting the gift-bearing Greeks to their former jailer. Mr. Morley's appointment as Chief Secretary, so far as it went, was accepted as a pledge of sincerity, but the Irish knew little of Lord Aberdeen and they knew a great deal about the Castle of which he was the latest occupant. There was, therefore, no popular demonstration when Lord and Lady Aberdeen began their viceroyal duties. The popular party in Ireland stood askance, boycotting the castle as they had boycotted it for years past; and as the Loyalists, so-called, regarded the new administration as a band of traitors and renegades, the lot of the new Viceroy was anything but a happy one.

From this position of isolation they were rescued by a happy experience which turned the tide, and was the first conspicuous act that notified to the Irish people the change which had come over the spirit of their British rulers. There was in that year a great distress in the west of Ireland, and the Castle had, of course, official intimation of the sufferings of the poorer cottagers on the Atlantic coast. The ordinary method by which relief is obtained is by a meeting in the Mansion House, called and presided over by the Lord Mayor. It has been the curse of the system in Ireland that the Lord Mayor of Dublin and the Viceroy of the Queen at the Castle have held aloof from each other. The Jews have no dealings with the Samaritans, neither have the patriots of the Mansion

House anything to do with the courtiers at the Castle. On this occasion, however, a private communication was sent from the Castle to the Lord Mayor, Mr. T. D. Sullivan, the poet, patriot and genial chief magistrate, to suggest the calling of a meeting in order to devise means for relieving the distress, and he received a further intimation from the Castle to the effect that although his Excellency could not attend as Lord Lieutenant he would be very glad to be present in his capacity as a citizen resident in Dublin. Mr. Sullivan, one of the best hearted men in the world, who was acquainted with the high character and sterling sincerity of the Viceroy, was very glad indeed to receive the intimation, but just a trifle anxious to know how the boys would take it. As there is no omelet without breaking of eggs, their Excellencies carried it through. Every individual whom they consulted, including all the authorities, opposed their action. They were warned that they would be hissed, that they would begin their viceroyalty with a slap in the face which they would never get over, and that the one thing which they should avoid above everything was the running of any risks. To all of which advice, although couched in the most diplomatic way and pressed upon them with the greatest authority, they turned a deaf ear. It was an inspiration, and they did well to act upon it.

The news had got abroad that the Castle was going to visit the Mansion House, and an immense crowd was gathered in the neighborhood to see the viceroyal carriages. In Dublin the representative of Her Majesty keeps up the tradition of royal state much more than in the more democratic colonies. On this occasion the Viceroy drove through the streets of Dublin to the chief magistrate of the city with the usual carriage and four, with postilions and outriders. It was a critical moment when the carriage drove up in front of the door of the Lord Mayor's official residence, and the Viceroy and his wife, in their capacity of citizens, descended to attend a meeting summoned to consider the distress in the west of Ireland. It seemed to those who were present as if the crowd quivered and hesitated, not knowing whether to hiss or to cheer, when suddenly one of the boys gave rein to the exuberance of his enthusiasm and broke out into a hearty cheer. Another second and all suspense was at an end. Amid a roar of cheers, the like of which had never been heard behind a Viceroy in recent years, Lord Aberdeen made his way into the meeting hall. The climax of the proceedings was reached when Lord Aberdeen requested to be introduced to Michael Davitt. When the one-armed ex-Fenian convict grasped the hand of Lord Aberdeen there was a public pledge given and recognized of all men of the alliance of the Irish democracy and all that was best in the popular party in Britain.

The Unionists, of course, were scandalized that a representative of the Queen should shake hands with a man who had done his term of penal servitude in Portland prison, but all men, irrespective of party, who knew the high character and stainless life of Michael Davitt rejoiced that such typical representa-

tives of the two races should have publicly exchanged the right hand of fellowship before the eyes of the two nations. From that moment everything went well with them in Dublin. A strange and what appeared to most Irishmen an incredible thing took place. Dublin Castle, so long the symbol of an alien dominion, became the headquarters of the Nationalist movement. Lady Aberdeen, remembering her Irish descent from the O'Niells, threw herself heart and soul into developing the industries of Ireland. As a rule, the Scotch get on better with the Irish than the English do. This is curious, as the Scotch are far more reserved than their Southern neighbors, but as a matter of fact even the dourest Presbyterian Scot manages to get along better with his Irish Catholic neighbor than an Englishman in the same circumstances. Everything that Lord and Lady Carnarvon had tried to do the Aberdeens took up and did with the greater force and vigor that comes of conscious reliance upon popular enthusiasm. The six months which they passed in Ireland were among the best in Irish history, a kind of glorious summer day out of due season, but heralding the sunshine to come. Over at Westminster the Home Rule bill, framed upon the fatally false foundation of excluding the Irish from the Imperial Parliament, staggered heavily downward. Even at the eleventh hour the bill might have been saved if the exclusion of the Irish members had been frankly abandoned, but Mr. Morley willed it otherwise, and the Government marched to its doom. After the fatal decision was taken there was a dissolution which resulted in the return of a large Unionist majority. Then the hour came when Dublin Castle had to give up its pleasant occupants and the brief break in the long tradition of repression and distrust came to an end. It was not until that day of leave taking that the Aberdeens themselves or the public had any adequate conception of the degree of passionate personal enthusiasm and devoted loyalty which they had succeeded in six short months in creating in the capital of Ireland. The whole of Dublin city turned out to give the Viceroy

and his wife a national Irish farewell. As they drove from the Castle down to the station, through streets filled with cheering and weeping crowds, it was evident even to the most cynical observer that the popular heart had been touched to its depths. Everywhere in the streets, banners were waving and flags flying, and strangest of all, for the first time in recent years, the Irish National Band played "God Save the Queen." It was a great moment, and one which made the heart swell high with pride and gratitude that such an outburst of popular sympathy had been brought about by the simple talisman of helpful sympathy and profound respect. For the Aberdeens had learned to love the Irish people with a whole-hearted devotion which touched that emotional and appreciative people to the quick. They saw in Lady Aberdeen especially one who was more Irish than the Irish themselves, and the enthusiasm and loyalty which her presence elicited did more to reveal possibilities for the pacification of Ireland than all the administrations of all the politicians. When the cheering crowds had shouted their last farewell and the viceregal party were steaming towards Holyhead they had the consolation of feeling that even if the ship had gone to the bottom they had not spent their lives in vain. But the ship did not go to the bottom, and the viceroyalty of Ireland may be said to have been the entrance leading up to their future history. They had arrived, and henceforth their position among the first half dozen families in the Empire was clear.

IV. THE COUNTESS OF ABERDEEN.

In the foregoing pages repeated reference has been made to Lady Aberdeen. I must now deal for a brief space with one who might well afford a subject for a separate sketch. Lady Aberdeen is the daughter of Sir Dudley Couëts Marjoribanks, since created Lord Tweedmouth, of a staunch old Whig Border family, and who himself represented the "good town of Berwick-on-Tweed" for thirty years as a Liberal. The family seat is in Berwickshire, but

HADDO HOUSE, SCOTLAND. THE HOME OF THE ABERDEENS.

little Ishbel's home was in Guisachan in Invernesshire. It was a wild and romantic spot. The country seat nestled at the head of a lovely mountain strath twenty-three miles from the nearest railroad station or telegraph office. In this mountain solitude the young girl grew up a strong and sturdy Scotch lassie, passionately fond of reading and of the vigorous outdoor life of the mountain child.

Her father, the son of the well-known Mr. Edward Marjoribanks (who up to the age of ninety-four transacted all the heavy duties falling to the lot of the senior partner of such a bank as Coutts'), combined with his hereditary business instincts strong literary and artistic tastes and a passion for everything that pertained to sport and natural history. It was this which led him in early manhood to settle himself in the wilds of Invernesshire, and there to create a very paradise, in the midst of which he lives the life of an ancient patriarch amongst his retainers and his ghillies, to the great benefit of all the glen.

Lady Tweedmouth, a woman of great beauty and talent, was the daughter of Sir James Hogg, one of the mainstays of the old East India Council, and many members of her family can boast in recent years of having maintained in the service of their country in India the high traditions of their combined Scottish and Irish ancestry.

With such a host and hostess and in such surroundings "Guisachan" became renowned in all the North of Scotland for its wide hospitality, and every autumn found gathered beneath its roof prominent politicians of both parties, artists, literary men, sportsmen. Thus it naturally came about that between the annual six months' Parliamentary season in London and the circle of friends visiting her Highland home the little Ishbel was brought into contact with most of the leading men of the day, riding and walking in their company, listening to their stories and mutual reminiscences, and imbibing all unconsciously a strong Liberal bias, which presently blossomed into full force under the friendly influences of Mr. Gladstone.

Another result of her youthful surroundings was to accustom her to free intercourse with persons of

LADY ISHBEL.

very various religious creeds. In her native glen the great majority of the people were Celtic, Roman Catholics, whilst the minority consisted of strong Free Church folk, with a sprinkling of adherents of the Auld Kirk, amongst which were her own family. She and her white pony were at home amongst them all, and many were the stories she heard and the sympathies that were evoked as she learned to spin or bake "cakes" by the side of the old Highland "wifies," or to watch for the deer and the grouse with her father's gamekeepers. It is curious to note how these early experiences trained the young girl for her future connection with the Roman Catholic and Presbyterian populations of Ireland, and it is a strange coincidence that circumstances should have accustomed both Lord and Lady Aberdeen from childhood to follow the example of the Queen in being mem-

bers of both Presbyterian and Episcopalian churches, according as they resided in Scotland or in England.

God fanned her with His ripening looks,

And heaven's rich instincts in her grew

As effortless as woodland nooks

Send violets up and paint them blue.

This Scottish girl, with her Gaelic name, nursed on tradition, on romance, and surrounded from infancy with the sound of the stirring melodies of her native hills, was only eleven when she first saw her present husband. It chanced upon a day that a young man of twenty-one who had been riding across the country, lost his way and came over the hills with a footsore pony to the entrance bridge of Guisachan. He was little more than a boy. Slight of frame although of ordinary stature, with a frank, fearless look in his eye, as he, after many apologies for trespassing, craved permission to put his pony up for the night at the

GUISACHAN HOUSE, LADY ABERDEEN'S ANCESTRAL HOME.

Parliamentary friend, the Earl of Aberdeen. He at once gave a highland welcome to the belated traveler. Ishbel, then a girl of eleven, saw the visitor and soon after she fell in love with him, nor has she from that day to this ever wavered in the whole-hearted devotion which exists between her and the man who afterwards became her husband. The portrait, reproduced by permission, of Ishbel Marjoribanks at the age when she first met Lord Aberdeen is copied from a beautiful colored miniature painting which is among the treasures of the family. The acquaintance thus auspiciously begun was continued in a friendship which was consummated and placed upon a more permanent foundation when in the year 1877 Ishbel Marjoribanks became Ishbel Aberdeen.

ISHBEL MARJORIBANKS.

lodge so that he might the next day continue his journey. Sir Dudley Marjoribanks, on inquiring for the identity of the strange wayfarer, found that he was named John Campbell Gordon, the son of an old

They passed their honeymoon in Egypt, where his father, Lord Haddo, had spent many happy months in the vain pursuit of health. It was while they were going up the Nile in their dahabeah that they had the good fortune to meet Gen. Gordon, then Governor-General of the Soudan. He was scouring up the river in his steamer, while they were slowly toiling up propelled by the sluggish stream. Not knowing how to attract the attention of the Governor-General, Lord Aberdeen hit upon the idea of firing signals of distress. This at once brought Gen. Gordon to their boat, and recognizing in his visitor the head of his clan, he extended him a hearty welcome and rendered him the fealty which is due from every Gordon to the head of his house. Gen. Gordon took to Lord Aberdeen as if he had been his own brother, and before parting for the night he presented Lady Aberdeen with a beautiful set of little silver coffee cups as a token of their friendship. The dahabeah and the steamer parted in the night and in the morning they were out of sight. They met Gen. Gordon again at Cairo and dined with him in the spacious palace which was placed at the disposal of the simple soldier by the Khedive. They had a long discussion with him as to the possibility of repressing the slave

trade. That it existed in Egypt they had the best opportunity of knowing, for hearing that boys were bought and sold as merchandise, they sent their man ashore at one of the villages stating that if they had any boys for sale they would be glad to see them. Without any delay a slave merchant brought four boys on board the ship and set forth with much detail their various advantages, and discoursed upon the benefits which would accrue to the purchaser who obtained such a desirable human article. The merchant then stated the price at which he was willing to part with them. Lord Aberdeen pointed to the British flag which was flying at the masthead and told the slave dealer that the four boys were slaves no longer, as wherever the British flag flew slavery ceased to exist. But in order not to create a hubbub he stated that he was willing to take charge of the boys and give the slave dealer a present almost equivalent to the price which he had asked. They took the children up to Assiout and handed them over to a mission to be baptized and brought up. Then a difficulty arose. The missionaries refused to baptize them

LADY ABERDEEN AND CHILD.

A FAMILY GROUP.

unless their parents or adopted parents would take the responsibility of presenting them for baptism. Lord and Lady Aberdeen, having put their hands to the plough, did not turn back, but at once adopted the four boys as their own children and they were all baptized and placed in good keeping. Three of them afterwards died of consumption. The remaining one grew up and became an earnest Christian and is at the present moment a missionary in the Soudan. These were not the only adopted children the young couple possessed when they came back to England from their honeymoon. They had no fewer than five adopted children. Four of them were left at Assiout, but one was brought with them to England. This was an Egyptian lad who had become a Christian, but who had been tortured into recanting. He had run away from his tormentors and was more or less at a loss, and did not know what to do. Lord and Lady Aberdeen therefore enabled him to leave the country undetected in the character of one of their servants. On arriving home they put him to college at Edinburgh, and he is now a missionary in China.

In addition to their adopted children they have had five children, four of whom are living. The second daughter died in infancy. Lord Haddo, the Hon. Dudley and Hon. Archie are the boys, while Lady Marjorie, who is only thirteen years old, is the only surviving daughter. Lady Marjorie has the distinction of being the youngest editor in the world, and her little monthly, *Wee Willie Winkie*, is an almost ideal specimen of what a child's paper should be. It is simple, natural, interesting, and I am glad to hear that it is likely to have an extended range of usefulness on the American continent. Lady Marjorie is an interesting child, somewhat tall for her age, but still a child at

her lessons. She does her editing in the intervals of play time. Like all the rest of the family she is devoted to her mother, who is naturally very anxious that such a child should not be unduly forced into prominent activity. Lady Aberdeen possesses immense activity and energy, together with a capacity to do things and get them done. Her first training in the way of organization was the establishment of the Onward and Upward Society, an association which began on a small scale among the domestics and poor people on their estate in Aberdeenshire, and which has spread until they have about 9,000 members throughout the world. In connection with this

and in calling attention to and advertising the existence of Irish manufactures, which are quite worthy to take equal rank with any other nation in the world. Much of the Irish lace and other displays took a high place among the exhibits at the World's Fair, winning forty-seven medals. Thanks largely to the business capacity, untiring industry and constant vigilance of Mrs. White, the Irish Village at Chicago, with over one hundred Irish inmates, was a great success from every point of view, as an object lesson of what the Irish could do. It was a realistic reproduction of the actual conditions of life in the old country, which made a very handsome profit for the extension of the work

LADY MARJORIE AND LORD HADDO GORDON.

HON. ARCHIE AND HON. DUDLEY GLADSTONE GORDON.

Lady Aberdeen edits a monthly review under the title of *Onward and Upward*. Dr. Lyman Abbott, writing upon this association in the *Outlook*, says that it is a combination of the Y. W. C. A., Working Girls' Club and the Chatauqua Literary and Scientific Association. Another work with which her name is even more prominently associated is the Irish Industries Association, which was brought more conspicuously before the American public by Lady Aberdeen's Irish Village, with its reproduction of Blarney Castle, which stood at the entrance of the Midway Plaisance in Jackson Park. It is difficult to estimate the stimulating influence of this association in promoting the development of the domestic industries of Ireland

of the association. They have now taken a place in Wabash avenue, Chicago, where the products of Irish industry are on sale. Similar depots will probably be established throughout the whole world in time. A large measure of the expense for maintaining the machinery necessary to develop these industries into self-supporting concerns has been supplied by Lord Aberdeen, while the amount of labor which has been devoted to the task by the Countess is almost inconceivable. She has her reward, however, in what promises to be a very thriving industry, or rather series of industries, which have begun already to contribute not a little to the amelioration of the condition of life in old Ireland.

THE IRISH VILLAGE AT THE WORLD'S FAIR.

Perhaps the most important work on a wide scale with which Lady Aberdeen has been connected was that which she undertook in the Woman's Liberal Federation, a body of 80,000 women of which she is at this moment President, although she will retire at the next general meeting. She was elected to this post in succession to Mrs. Gladstone, and the very strongest possible pressure has been brought to bear upon her to induce her to reconsider her determination to resign an office the duties of which she cannot discharge from Ottawa. The Woman's Liberal Federation, it is well to remark, is no mere party caucus. There is no doubt that it was originally started by some wirepullers of the Liberal Party, who imagined that it might be of good service to bring into existence a Liberal counterpart to the Primrose League. The Woman's Liberal Federation, however, no sooner came into being than it developed an independent activity of its own which led it to be regarded with the liveliest feelings of resentment by the caucus managers and wirepullers who had assisted in bringing it into being. The association has had a great and beneficial effect in stimulating women to take an intelligent interest in politics and to make their influence felt in all that relates to the moral and social im-

provement of society. Time and again they have rendered invaluable service to the cause of moral and social reform, and nothing can be further from the mark than to confound such an association of energetic public-spirited women with a mere creature of the party whip. There are women in England who imagine that their only duty in politics is to canvass for a candidate of their party, whoever he may be, and they have formed a small caucus of their own, which is without numbers, without influence and without standing in the country. The Woman's Liberal Federation is a national organization which is growing in strength every year, and which insists on having a voice in the settlement of all national questions. As a means of education as well as an instrument of political influence it fills a very useful part in our political economy. Lady Aberdeen has not been long in the Dominion of Canada, but she has already helped to organize a National Council of Women, the object being to form a body of women representing all phases of women's work in every center of population in the whole Dominion. It is hoped that such a body will promote unity and charity, both amongst religious, philanthropic and secular associations, giving all a chance of knowing of

what is being done for the good of the world outside their own immediate sphere. It will also secure their joint consideration of public questions and their joint action when circumstances arise which will necessitate their practical intervention. Of course, like others who have taken any interest in the amelioration of the condition of life, Lady Aberdeen believes firmly in woman's suffrage. In her present position as wife of the Governor-General she is necessarily precluded from taking any part in questions that can by any pretense be alleged to belong to the domain of party politics. It ought not to be a question of party politics to affirm that a woman is a human being, nor should a Governor-General's wife be debarred from insisting upon the natural corollary of that fundamental truism. There is no doubt, however, that the National Council will tend to lead women more and more to take counsel together and see whether it is not possible for them to bring such influence to bear as to render it possible for the best men, truly the best men, to be returned to the Houses of Parliament.

LADY MARJORIE GORDON.

The thirteen-year-old editor of "Wee Willie Winkie."

HON. ARCHIE GORDON

(As one of the "Children's Guard of Honor" in attendance upon the Queen on the occasion of the unveiling of Princess Louise's statue of Her Majesty in Kensington Gardens, June, 1893.)

V. GOVERNOR-GENERAL.

During the whole of the Salisbury administration it was regarded as a matter of course that with the advent of a Home Rule administration Lord Aberdeen would go back to Dublin as Viceroy. The immense success which had attended his previous viceroyalty and the continued and continuously increasing interest which Lady Aberdeen took in all that concerned the material interests of the distressful country caused the ordinary man to take it as a matter of course that whatever appointments were in doubt, there could be no more question as to who would be the Irish Viceroy than there was as to who would be the Prime Minister. Mr. Gladstone himself was believed to share this view, and great indeed was the astonishment of the country when on the gazetting of the appointments Lord Aberdeen's name did not appear on the list.

It is an open secret that the appointment of Lord Houghton to be Viceroy was due entirely to the initiative of Mr. Morley. Mr. Morley was and is a close friend of the Aberdeens, but he deemed it desirable in the interests of the new administration that England should have not two representatives in Ireland, but

one, and that one should be himself. No doubt from his own standpoint, however, he was abundantly justified; and for the general interests of the Empire we cannot but rejoice that Lord Aberdeen should have been provided with a sphere of influence immeasurably more important than that which he would have had as a Viceroy at Dublin.

At first there seemed some doubt as to whether they would have gone to India or would accept the Governor-Generalship of Canada. During the Conservative administration he had traveled together with Lady Aberdeen over the whole of the British Empire, including India. There is scarcely a colony or dependency which they did not visit. But apart from Ireland there was no post in the Empire more congenial to Lord and Lady Aberdeen than the Governor-Generalship of the Dominion of Canada. Canada reminded them in many points of their own native land, and they had been very much impressed with the future of the country. A few years ago they had established a kind of country seat for themselves in the ranching lands of British Columbia. There they retired from time to time away from the incessant round of duties which occupied them at Dollis Hill and at Haddo House. They had repeatedly visited the country, and, as an eminent official said to me, they brought to the Governor-Generalship more personal knowledge of Canada than most Governor-Generals are able to acquire in the course of their office.

The term of office of Lord Stanley, the present Earl of Derby, did not expire till last midsummer. As soon as he retired Lord Aberdeen was appointed. Lord Stanley as Governor-General was somewhat colorless. Lord Stanley, although respectable and honest, has left no definite impress upon his contemporaries either in London or in Canada. But to Lord Stanley has succeeded a Governor-General of a very different stamp, and nothing could have been more auspicious than the welcome with which he has been received in the Dominion. The post is one of considerable difficulty in difficult times. But when everything goes smoothly the only difficulty is to reconcile the existence of an establishment so regal in a democracy so simple as that of the Canadas. Lord Aberdeen, however, had hardly landed upon Canadian shores before it became evident that he was much more than a mere Governor-General. He was a living man with wide and catholic sympathies, who recognized that while it was necessary to abide strictly within the constitutional limits in all political questions, in non-political questions, which after all occupy three-fourths of human interest, he was in a position which placed upon him and his family the obligation of exercising all the influence which any highly placed and cultured citizen is bound to exercise. On his landing, in reply to an address of welcome, he sounded the keynote:

"It is indeed an office of high honors, as well as of grave and serious responsibility. But, gentlemen, does the honor and dignity of it exclude the holder from the common lot, the common heritage of service? Nay, it implies, it includes, it conveys this privilege, this grand principle and purpose of life. If

and because your Governor-General is in the service of the Crown, he is, therefore, in a literal and absolute sense, in the service of Canada. In other words, aloof though he be from actual executive responsibility, his attitude must be that of ceaseless and watchful readiness to take part, by whatever opportunity may be afforded to him, in the fostering of every influence that will sweeten and elevate public life; to observe, study and join in making known the resources and development of the country; to vindicate, if required, the rights of the people and the ordinances of the constitution, and, lastly, to promote by all means in his power, without reference to class or creed, every movement and every institution calculated to forward the social, moral and religious welfare of all the inhabitants of the Dominion. Such, gentlemen, I venture to assure you is the aim and purpose which, in dependence on the one ever effectual source of help and strength, we desire to pursue."

There is in this brief speech the keynote of the whole of Lord Aberdeen's life. He has succeeded, it is true, to a peerage and office of great usefulness and of high position, but he has also succeeded to what he finely calls "the heritage of service." As the servant of the Crown he is also the servant of Canada. It is the old principle which led the Pope, the most highly placed of all mortals, to describe himself as *servus servorum*. There is no doubt but that Lord Aberdeen will find ample opportunity of proving himself a servant in deed as well as in name. There is plenty to be done in Canada, and few men are so capable of doing it as is Lord Aberdeen. Traditionally and personally a Protestant, he has always cultivated the most friendly terms with Catholics, and one of the first and most significant of his actions in the Dominion of Canada was to overcome by a little kindly diplomacy the obstacles which have hitherto prevented the friendly meeting of the Governor-General and the Cardinal of Quebec. It may pass the wit of man to invent any way by which the French Canadian and the Orange Protestant can be prevailed upon to recognize that each are brothers in Christ as well as subjects of the Queen. If it could be done the Aberdeens are the people to do it. Lady Aberdeen, as I happen to know of old time, was regarded with affection and esteem by the late Cardinal Manning. "She is a good woman," I remember he said to me, with great emphasis, on one memorable occasion when her kindly woman's heart was the means of getting him to stretch out a helping hand to save a poor soul that was tottering blindly on the verge of the abyss.

Nor is it only in tending to assuage the rancor of contending creeds that the Aberdeens have plenty of work before them. As intimate friends with Professor Drummond, they are thoroughly in sympathy with the more liberal spirit which finds expression in the higher and more Christian thought of the closing century. In that direction their influence can hardly tend but to sweeten the theological atmosphere and to bring to those who are bowed down beneath the shadow of an austere and repellant faith

MR. AND MRS. GLADSTONE BIDDING FAREWELL TO LORD AND LADY ABERDEEN ON THE DAY OF THEIR DEPARTURE FOR CANADA.

(From a Kodak taken by Lady Aberdeen.)

somewhat of the more genial and brighter joy of the larger hope.

In all questions connected with education and of the multiplication of opportunities of social enjoyment and of humanized intercourse they have, in England, been in the forefront, and their transfer to the New World will open up new fields to their untiring activity. Lord Aberdeen is president of the Boys' Brigade, an admirable institution by which it has been found that the interest of youths in the most critical period can be excited by the substitution of a little discipline and drill for the usual methods of the Sunday school. Both Lord Aberdeen and his wife have taken a great part in the formation and maintenance of the Parents' Educational Union. With them, as with all those who really think, the family is the real unit with which all amelioration must begin, and in emphasizing the responsibilities of parentage and in carrying on the propaganda in favor of more home training they have done and will do a great deal of good.

To the directly political action which a Governor-General can take it is not necessary to refer here. As Lord Dufferin remarked, when times are smooth and things go well there is little for a Governor-General to do beyond lubricating the machinery, but when storms arise and the machinery gets out of gear there are plenty of opportunities for a Governor-General to develop the higher qualities of statesmanship. In Canada there is a widespread conviction, confined, by no means to the Opposition, that we are on the verge of a transformation of power from the Conservatives who have succeeded to the heritage of Sir John Macdonald's prestige to the Grits or Liberals, who are confidently looking forward to gaining a majority at the coming general election. It is not likely that the majority which will change the reins

of power from Sir John Thompson to those of Mr. Laurier will be large, unless, of course, the tariff proposals of Mr. Wilson should lead to a great accession of strength to the advocates of a reformed tariff in the Dominion. It is by no means impossible that if the tariff bill is carried the advocates of reciprocity between Canada and the United States may be able to establish themselves in power at Ottawa, with instructions from the electors to minimize the curse of a custom house which impedes the free interchange of commodities between the United States and Canada. If such a contingency should arrive it is obvious that there would be plenty of work for the Governor-General to do, and it is satisfactory to know that Lord Aberdeen is certain

to use all his influence in the direction of maintaining good relations between the Empire and the Republic.

There is another thing which it is impossible to pass over entirely unnoticed, although it is unnecessary to say more than a word about it. When I was going through Ottawa Jail Mr. McGreevy, a well known director and Member of Parliament, who had for years past been the friend and ally of the leading ministers of the Dominion, was sent to jail for a year on the charge of corruption in the matter of contracts which had got mixed up with election funds. The gangrene of corruption, which undoubtedly prevails to some extent among politicians in Canada, is one of those frauds against the commonwealth which call for the unceasing vigilance of the Governor-General. In what way it may be possible for Lord Aberdeen to take action in the matter it is impossible to say. Two things, however, are certain: first, that he will loyally abide within the limits of the constitution, but not less certainly, if an opportunity arises by which he can within these limits strike a blow at the malady which afflicts the commonwealth, no personal considerations will for a moment stand in the way of any action, which will be all the more resolute because it will be heralded by no flourish of trumpets or preliminary parade.

I have left myself but scant space in which to speak of the Aberdeens at home. It is a wide subject; for not only have they many homes, but they are at home everywhere, and they have the faculty of making everybody feel at home where they are. Whether it is a ranch in British Columbia, at the family seat in Aberdeenshire, in Lord Shaftesbury's house in Grosvenor Square, which they rebuilt for their own use, or at Dollis Hill, the suburban retreat which has so often afforded Mr. Gladstone a welcome oasis of leis-

ure and domesticity in the midst of political strife, they are always the same—simple, unassuming, kind and hospitable. They are always endeavoring to enable their guest to appear at his best, and with generous self-effacement, seeking only to minister to his welfare. Their hospitality is not confined to any

COLDSTREAM. LORD ABERDEEN'S RANCH NEAR VERNON, BRITISH COLUMBIA.

sect, party, class or condition. The visitors' book at Haddo bears many names, from that of Her Majesty the Queen down to some of the poorest of her subjects. Nor have any rested within its walls without experiencing the charm which comes from perfect culture combined with high religious purpose, which is felt all the more because it is never aggressively asserted. Among the later guests who assembled at Haddo House immediately before the departure of the Aberdeens for Canada was Col. John Hay, who left as his autograph in the visitors' book a couple of verses which may be appropriately quoted here:

"Ask me not here amid these storied halls,
Vowed to traditions of high strenuous duty,
Where faces of dead statesmen deck the walls
With righteous glory's ever living beauty—

Ask me not here to turn a careless rhyme,
It ill would suit the solemn place and hour
When Haddo's Lord bears to a distant clime
The Gordon conscience backed by Britain's power."

Dollis Hill, near London, is the great gathering ground for religious and philanthropic movements. The first time I visited it was to listen to Mr. Gladstone address an out of-door assemblage in protest against the coercion of Ireland, but religious denominations and various charitable associations find there their natural rallying ground. In their absence from England it is difficult to see who will fill their place. Lady Aberdeen is an enthusiastic photographer, and her book, "Through Canada with a Kodak," bears abundant testimony to the fact that she has the eye of an artist as well as the pen of a quick and observant writer. As a speaker she is very effective, her voice is full of music and singularly free from the shrillness which sometimes mars the oratory of women. Every morning at Rideau Hall the household assembles for morning prayers, which are conducted by Lord Aberdeen, or in his absence by his wife. They are very simple. A hymn is sung, a chapter in the Bible is read and then Lord Aberdeen reads prayers, and the household then join in the Lord's prayer. This, however, is by no means the only occasion on which the heads of the house and the domestics meet on a footing of equality. Every week they have a meeting of their household club, which is social and educational. Members of the household and visitors take part in a medley of music, speechmaking and discussion. There are besides classes held in connection with the club and lantern lectures given. On the whole, the experiment is one full of hope and promise and worthy of imitation.

There is a fine spirit of brotherliness running through the whole establishment at Rideau Hall and the genial glow of that household life will be felt far and wide in the New World. What the future may hold it is impossible to say, but it is not a very hazardous prediction to say that at the end of five years even those who most grieved that Lord and Lady Aberdeen did not return in 1892 to the Green Isle they love so much, and which so heartily returns that love, will rejoice that this did not come to pass at that time. It is impossible for me to express more strongly my conviction as to the good results which are likely to follow from this Governor-Generalship.

THE MISSION AND DESTINY OF CANADA.

[Mr. W. T. Stead, whose recent visit to Canada was productive, among other interesting results, of the preceding character sketch of Lord and Lady Aberdeen, addressed numerous audiences in the Dominion. The following pages contain the greater part of an address given in Toronto, dealing mainly with the international position and relations of Canada.—EDITOR.]

I HOPE that you will not think that I aspire upon the strength of having been a little more than ten days in Toronto, Ottawa and Montreal, to read your horoscope for the future. I have come more to seek information than to impart my own views, and I can honestly say that since I came to Canada I have talked to men and women of all shades of opinion and I have heard quite a bewildering variety of views. It is not, however, of what has been said to me that I want to talk to-night.

I want rather to speak to you of ideas which we have long discussed on the other side. First I should like you to understand the position from which I approach this subject. I come from an old country. You are in a new land which differs in so very many things from our country that it is difficult for us to understand the working of some of your institutions. Then again we differ from you in Canada in believing in Free-Trade. We may be all wrong, but we believe we are all right. The Dominion of Canada, however, is run upon the opposite principle. We do not say that you are wrong; we only say that if we had to pronounce an opinion, upon what seems to us sound principles, we should say that you were wrong. You, however, have come to the opposite conclusion in Canada. This again makes one very modest and diffident in expressing any opinion upon a subject on which your people and ours can take such opposite views.

THE ENGLISH SPEAKING WORLD.

What is the body to which Canada belongs? Possibly some of you may think that I am going to say it belongs to the British Empire. That is not my answer. As a matter of fact, politically of course, that is true; but that is not the body to which I refer. The body to which Canada belongs is the same as that to which England, Australia and the United States of America belong. Canada is a natural part and an important part of that great body politically, as yet but imperfectly organized and very imperfectly realized, which we call the English speaking world. That world has, as yet, no common centre of government, and so far as a central government goes there is no such entity as the English speaking world in the political sense.

But if any one came down to this planet from another star and looked at the children of men he would recognize the English speaking world as a real and substantial entity, divided by seas it is true, but with one law, one language and, on the whole, one system of government by the people, for the people and through the people, one literature and, if we speak broadly, one social and religious ideal. These things constitute the English speaking world an organic entity in a more real sense than, for instance, that which is created by the uniform government which the British Empire has established over the many and varied populations of Hindoostan. The English speaking world is a far more real entity, with far more solidarity in it, with more cohesiveness and with

more self consciousness of unity than the congeries of races and tribes which live in peace together in British India in one State system or empire. Therefore, I think that we are justified in speaking of the English speaking people as one people. I may be wrong, but to me it seems that the strengthening of the ties which bind the various parts of that world together constitutes the most important political task that is before us as a race.

OUR SUPREME DUTY.

Looking from the standpoint of London it seems to us that the great question which lies before us as a race is the great question as to what are to be the future relations between the British Empire and the American Republic. So far as I am concerned I do not hesitate to say that I regard the maintenance of good relations between the British Empire and the American Republic—nay further, the establishment of some closer nexus which would bring the Empire and the Republic into one political unity—as the greatest object for which any politician or statesman could work or for which any patriot could pray. In other words, after a hundred years in which we have been separate countries and in the course of which we have more than once been brought almost to the verge of war, it seems to me that the time has come when we ought to ask ourselves seriously whether there is no possibility of undoing the mistake which George the Third made? I do not mean, as you all understand, I do not even wish to see the States of the American Republic restored to their old position of dependence upon the mother country. That would be just a trifle too mad for any one outside of Bellingham to suggest. There is, however, a great deal of difference between that lunacy and wishing to undo the fault of the past. We can surely wish to close the great gulf yawning between the two sections of the English speaking race without wishing to see them in the position of dependent colonies governed from Downing Street. The great work which we as patriots and especially as imperialists have to do is to endeavor by every means in our power to promote the growth of that unity which was sacrificed a hundred years ago.

CANADIAN POWER AND RESPONSIBILITY.

This being the case, you can see how immensely important a position Canada holds in our outlook over the universe. Canada is the pivot state, she holds the pass. It depends upon you in Canada what these relations will be. Your dealing, your manifest dealing is to decide whether the British Empire and the American Republic are in the future to be friends or foes. No, not foes. That is out of the question. I never, even in a nightmare, think of the possibility of an actual war between America and Britain. But we may be a great deal short of friends without being at war. It depends upon you in Canada more than upon any other population in the world whether the Empire and the Republic are to be jealous, nagging neigh-

bors, or cordial friends and allies all the world over. The future of civilization and the hope of the world depend upon the answer you will give. It is a great position which you hold. We in our own country may be as anxious to be friends with our American kinsfolk as it is possible for mortals to be. We might even make it the great object of our state policy, but you could paralyze and render abortive anything that we might attempt to do. You are the man on the horse in the present instance; we have to take the back seat. You are face to face with the actual questions—questions which arise and constantly will arise which create friction between the two sections of the English speaking people.

THE ISSUE AT STAKE.

The great question for us to consider is whether in this English speaking world there is to be reproduced the old bloody anarchy of Europe or a federal legal system towards which a beginning has been made in the United States of America. Which is it to be? Here again you have the deciding voice more than any other section of the English speaking people. I must say that in talking to many of your leading men I do not find that any sense of the enormous issues which lie waiting your decision has entered their minds. To talk to some of your politicians, one would think that the one great question which Canada had to decide was whether a certain Mr. Somebody, or an Hon. Mr. Nobody had to be in office for the next few years. It is very important, I agree, to the somebodies and nobodies as to who is in office, and it is also important to you whether there are honest men in power or rogues, but far more important than the mere local and provincial issues at your elections is this great and supreme issue in the great world-wide problem of the human race. Is Canada going to use her influence for peace or for war, for the establishment of good relations by a legal and federative system, or is she going to raise her voice in favor of reproducing in the New World the worst evils of the Old, and to establish in the midst of the English speaking world that principle of absolute independence which refuses to admit any superior, to recognize any law or to submit differences to any permanently constituted tribunal, and which patches up a court whenever difficulties get a little too hot to be settled by diplomacy. If I could speak so as to be heard by all your politicians and all your voters, I would implore you to remember that it lies with you to decide whether you will be the angel of peace helping to unite into one the English speaking people, or whether you will be like another Cadmus sowing the dragon's teeth from which will spring up armed men to desolate the world. That is the great question which it is your destiny to decide.

CANADA FIRST—BUT NOT LAST.

In the Old Country we want you to be first of all Canadians. We do not want you to sacrifice your Canadian commonwealth or your Canadian future to either England, Scotland, Ireland or Wales. We want you to look at this question from the point of view of the nationality which has come into existence in this land, and which is going to stay and grow more and more powerful and strong as the years go by, and which therefore has a right to judge all questions which come before it from the point of view of its own independent national existence. But at the same time that we expect you to do that, in the first place, we also ask you to look at the broader question of the common interests of the whole English speaking people. And let me here remark, for fear of misun-

derstanding, that while expecting you to be Canadian, we hope you will never cease to be British. However much talk there may be among those who write much and think little as to the readiness of the Old Country to cut the painter and let you go, or on your part to declare your independence and terminate once for all the existing relations which unite you to the mother land, there is no difference among us on our side in regarding such a severance as a disaster and a calamity. We are proud of you. We think that you are our greatest hope on this Western continent, and we look to you to enable us to do many of the things with the accomplishment of which we believe we are intrusted by Providence. We cling to you as brothers true and tried; and palsied be my tongue rather than it should say one word that would cause any Canadian heart to imagine that we in the Old Country think little of you or of your connection with us. But we have to look at you as parts of a larger whole. We look at you as the trusted friend and age-long ally through whom we have to approach the United States of America. We wish to know, if we honestly and with a whole heart try to bridge the chasm that was made a hundred years ago between England and the States, shall we have your hearty sympathy and help, or will you find it necessary, from some mistaken view of your own interests, to counterwork or to even oppose us and trip us up? If you have come to the latter determination, nothing that we can do will be any good. You have had your share of being dragged at our chariot wheels in times past. But now, in this question we have to follow and you must take the lead.

SOME SETTLED QUESTIONS.

Perhaps, however, I had better clear the way by saying that there are certain matters which I do not touch at all. I do not propose for a moment to discuss the question of the British connection. I have been told by your politicians on all sides that you have no wish to discuss that question, neither have I. There is only one danger that I can see to the British connection at present, and that would arise if any party, in order to snatch an electoral advantage, were to try to degrade the old flag into a party emblem. It is little short of treason to the Empire for any political party to impute to its opponents, without very good and absolute proof, a lack of loyalty to the flag that they are ready to shed their blood in defending. Neither do I discuss the question which is sometimes raised as to the usefulness of a Governor-General. I think that the question of the Governor-General is very much like that of the Monarchy with us. The Governor-General, like the Crown, represents a great reserve force of Democracy. If it were not for the Crown in our country we should have no chance at all of doing anything with the House of Lords. As all the prerogatives of the Crown can be exercised by the Prime Minister for the time being, the Monarchy gives a much greater power to the people than some republics, which make a much greater parade of their devotion to the rule of the people. But although our Monarchy is as a sceptre of power held in reserve by the democracy, I do not think that the Monarchy would survive another George the Fourth, nor do I think you would put up with a Governor-General who was either a fool or a knave. I think that the institution in both countries will last as long as the Monarchy and the Governor-General are respected by the people over whom they bear sway. Considering whom you have as your Governor-General to-day and considering how much we have lost by letting him come to you, I do not think that we need regard the question as to the office of

Governor-General as likely to be discussed for at least five years to come.

There is another question which is a more burning one, judging from the reports of meetings which I see occasionally in your papers. I do not propose to discuss the question of Canada assenting, or being compelled to assent, to the re-establishment of the Inquisition by the Jesuits, nor do I believe that Canadian electors have decided to banish their country out of the pale of civilization by re-enacting the penal laws. I believe that you mean that Canada is to remain a civilized country and therefore, whatever a few here or there may say, you, as a people, are not going to try and put the clock back fifty or sixty years and exclude or disenfranchise any section of your citizens because of their religious faith.

I think also in Canada you intend to remain, as a whole, an English speaking community. I do not think that any of my French fellow-subjects can possibly object to the frankest possible assertion of that on your part. While you allow the fullest liberty to any man to speak any language which he chooses and to have his children taught the language of their fathers and their mothers, there is no doubt at all as to your determination that, as a whole, this country is to be governed as an integral part of the English speaking world. That question, we think in England, was settled some hundred years ago at a famous battle near Quebec, and if any doubt existed on that point it was further dispelled by the recent ignominious collapse of one man who stood forth before the Old World as the somewhat blatant representative of a faction which imagined that, notwithstanding these hundred years, they could induce you, with all this continent behind you, to consent to the establishment of an independent French settlement at the mouth of the St. Lawrence. The United States long ago settled the question of the French state which stood at the mouth of the Mississippi. You have no need to settle that question. It was settled long ago and will not need to be reopened.

EMPIRE AND TRADE.

We can now go on to look at the question of your relations to the United States. I am an Imperialist, I was a strong advocate of Imperialism in the English press when very few English Liberals cared to call themselves by the name, but I am an Imperialist, as I often say, plus common sense and the ten commandments. I do not think that if you have sufficient common sense and enough regard for the ten commandments that your Imperialism will carry you into any antagonism with your neighbors. As an Imperialist I should have liked, of course, to have seen free trade the rule throughout the Empire, as it is the universal rule throughout the American Union. Therein it seems to me that the American Union has the advantage over us in that none of its States which lie between one seaboard and another can have any custom houses established on their frontiers. I wish that we had a similar rule throughout the whole of the British Empire. However, it is no use crying over spilled milk when Destiny, or Providence, or what you will, had decided it otherwise. We have now in all our colonies tariffs more or less hostile to the manufactures and the products of the mother country. I am not pleading with you to alter that in the least. You know well enough without any Englishman needing to tell you that we should be very glad if you could alter your tariff in our favor. But in discussing this question of free trade or protection an interested individual or one whose bias is

obviously in any one direction cannot speak with very much weight.

IS BRITAIN'S TRUE INTEREST IN CANADA?

No argument for protection from a man who is making his fortune on a protected industry carries weight, and you naturally distrust an Englishman pleading for better terms between England and Canada. That would be to our own interest, and, therefore, you might say "you are only asking for this in your own interest for our own interest." But I will not plead for better terms. Nay, I will go further. I attach so much importance to the good relations which ought to prevail between the Republic and the Empire that if it were proved to me, as an absolutely incontrovertible fact, that there was no other way of maintaining good and friendly relations than for Canada to discriminate against the mother country and in favor of the Republic, I should say, in God's name do it! But I do not believe this to be true, nor do I believe that any one will be able to prove that it would be so. I only mentioned it in order to show that I am not pleading for English selfish interest in this matter. Of far greater importance than differential duties with our market is the maintenance of good relations and of a cordial entente with your neighbors. I maintain that from the British Imperialist point of view, from the standpoint of our own interests, this is far more important than any chance there might be of having the tariff discriminated in our favor. Apart from the value of American friendship, what is our real, vital, permanent, even from a trade point of view, interest? It is that you should be as prosperous as possible, that you should want to buy as many British goods as possible, and it is not our interest to stand in the way of your prosperity, even to the extent of a red cent. What we want you to do is to get rich and strong, and the more you prosper the more business you will do with us, no matter what idiocy you put into your tariff, and you can do a great deal that way. (Laughter.) I was told again and again that although your present tariff was not a differential tariff discriminating against English goods, it does, nevertheless, take it all round, press more heavily upon English goods than upon American. And for this reason: Because your specific duties press heavier upon cheaper produce and, therefore, you discriminate against us, who produce the cheaper commodities. If you are really discriminating against us already I do not see why there should have been so much 'high falutin' about the old flag at the last general election.

THE ACCURSED CUSTOM HOUSE.

It seems to me that if we were in your place it would take a great deal of arguing to convince us that our interests were bound up with any commercial policy which insisted on running a line of custom houses right across our country. We have custom houses in the Old Country and a great nuisance they are, and yours are very much like their parents. There is, however, one thing in which our custom houses differ from yours. They stand upon our frontier which is the sea. We have no imaginary geographical line with custom houses on either side of it. But, you say, supposing we have no custom houses between ourselves and the United States, does that not mean that we have to adopt the United States tariff? I must say that men of both political parties with whom I have talked have repudiated that, the Liberals even more strongly than the Conservatives. But while it may be impossible for you to have absolute free trade between the Dominion and the

United States, there is no man who knows what business is and believes in free trade who can hesitate to say that such an ideal is the ultimate aim and end of every rational man. It can never be to the interests of communities identical in language, in religion and in law, living side by side along a great stretch of country, to establish any artificial barrier which will stand in the way of the freest possible communication and trade that they can desire. I do not think that that can be construed into a declaration of party policy at all. It is a principle which to an Englishman seems as plain as two and two make four. Whether it is a Chinese wall, or a wall of tariffs or a line bristling with bayonets, it is all of the devil, all the same.

FREE TRADE BETWEEN CANADA AND THE STATES.

I think you are all agreed, even including the present ministers of the Dominion, that some time in the far future, as they would say, or so soon as it would be practically possible, as others would say, it is your interest to reduce to the least possible minimum the custom house cordon which stands between you and your American brothers over the line. I hope that none of you will imagine for a moment that because I hate the custom house and would get rid of it whenever possible that I am in the least degree pointing towards a solution of the question which very few people have advocated here—namely, an annexationist policy. I am not for a moment even looking that way. I take the British connection as one of those things upon which there will be no discussion. But speaking as an Englishman, I think there can be nothing more fatal to the British connection than to tie up with the idea of the British connection the monstrous delusion that your farmer would get less for his eggs than if Canada had not been joined to Great Britain. It seems to me that your duties upon the American products and their duties on yours all tend to embarrass the farmer's hen in the performance of her necessary functions. It is very desirable that you who live on either side of the line which is drawn across this continent should be able to trade together as easily and with as little difficulty as possible.

PARTNERSHIP IN SEALS, WHY NOT IN FISH?

There are many things which I think we could help to do. I was very glad to see Sir John Thompson's speech concerning the Bering Sea Arbitration. I suppose the net result of it is that the Empire and the Republic have entered into a kind of copartnership arrangement in which we have to look after the seals. The seals have given us a good deal of trouble, but they are nothing like the fish on the other side of the continent. As a rule, when an English newspaper editor has to write anything about the United States and Canada he always feels inclined to get the *Encyclopædia Britannica* and look up Fisheries. (Laughter.) But where trouble and danger are, there is opportunity. It is difficulties which bring almost all the good things of this world. Everyday easy things do not cause people to think; it is when you have a good hard nut to crack that your ingenuity comes into play. There are plenty of difficulties between the Dominion and the Republic. All that I ask is that you should think of them seriously, bearing in mind the immense responsibility which weighs upon you. Do not look at them as a mere

question merely between the "ins" and the "outs." It is much more than that.

AN ENGLISH SPEAKING CITIZENSHIP.

It seems to me that in the future that is before us there should be but one common citizenship for all the English speaking lands, and that when an Englishman goes to Canada or America he shall be accepted as a citizen without having to take out naturalization papers. It would simplify matters a great deal.

AN INTERNATIONAL SUPREME COURT.

In that matter I think another great step might be taken. That is, whether the time has not come for the establishment of a Supreme Court. I think by a system of delegation from our Privy Council and from the Supreme Court at Washington by some other means, so as to form a permanent tribunal before which all disputes which could not be settled amicably should be brought. I do not like the idea of representatives of France, Italy and Scandinavia being called in to settle a question as to a close time for seals, which was a question between Canada and the States. I think the English speaking world is quite big enough to settle within itself all questions which may arise. But you must have your court in existence, however. It does not do to wait until the row comes on to decide that you will have a magistrate. You need to have him ready on the spot. Let us keep always in view the conception of a paramount International Court which would adjust these questions. I think it would be well if we had a tribunal which in time of heated wrangling could call halt and ask the disputants to pause and think a little. Such a pacificator's court would be very useful sometimes. At present the people who are supposed to act as guides of public opinion are the newspapers, and they are about the worst peace makers in the world. It is dull work making peace, and the natural interest of the newspaper man is to make his paper interesting. Therefore sometimes you will see how the British lion will roar and lash his sides so that all the world resounds, and you will hear the eagle on the other side flapping its wings and screaming like a demented barn door fowl, and all that it means is that so many columns have to be filled with readable copy with plenty of ginger in it. If we have really to work for peace in the world I think you ought to have some person who would be out of the conflict and could see both sides of the quarrel and ascertain what the real facts are and where the hitch comes in. Fortunately you have not had so much experience as we in the Old Country have had what trouble a misunderstanding may cause which a five minutes' talk with a level-headed man on either side would have enabled people to see where the difficulty lay. There is no more patriotic or Christian duty than that of endeavoring to minimize the causes of dispute and to reduce to the uttermost all points of friction between nations.

It comes all back to this: The foundation of national greatness lies deep down in the heart of every individual man and woman, and unless you can raise citizens who will bring a conscience to their work of voting, otherwise all your efforts at constitution building will be in vain, and we will go the way of Greece, Babylon, and of Rome.

LEADING ARTICLES OF THE MONTH.

REUNION OF THE UNITED STATES AND CANADA.

THE arguments for and against the political union of the United States and Canada are presented and forcibly discussed in the *American Journal of Politics* by Hon. Francis Wayland Glen, ex-Member of the Canadian Parliament. Mr. Glen takes as his text Prof. Goldwin Smith's recent statement "that the union of the two great English-speaking communities who now occupy and control this country would drive war from the United States and change the whole country to peaceful industry and progress. It would remove all internal customs lines and it would make the St. Lawrence, the fisheries and all questions which are now the subject of dispute, the undisputed heritage of all." Mr. Glen maintains that Professor Smith's conclusions cannot be successfully disputed, and he urges that the subject should be discussed in a liberal, kindly spirit on both sides of the boundary line, fully convinced that union can only be accomplished peacefully under full, free and public discussion in the press and upon the public platform in both countries.

MANY CANADIANS DESIRE POLITICAL UNION.

We are assured by Mr. Glen that there are many Canadians who earnestly desire to see political union peacefully consummated and who are quite willing and ready to make personal sacrifices to promote and secure it, but these persons "need and deserve a public declaration of assurance in unmistakable terms from a large, non-partisan organized body of American people, representative of public opinion in this country, that when they have educated and prepared a majority of the Canadian people to desire and seek reunion, Canada will be gradually received upon terms just and generous into an equal and honorable union." Especial emphasis is given to the fact that union with Canada will prevent the causes most likely to involve this country in a serious conflict with Great Britain and will make it possible to create and establish a moral union between America and the motherland. This he believes to be of far more importance to the several branches of the English-speaking race throughout the world than all the commercial and financial advantages to flow from it to the people of North America. He does not regard as serious the objection raised that under such an arrangement there would naturally be a solid Canadian vote. The late Secretary Seward, as long ago as 1867, declared that the interest of the English maritime provinces would always be with those of the Atlantic States; that those of the great central Protestant State of Ontario would be with that of New York and Ohio; that the interest of British Columbia would be with our Pacific States and that of any States organized between Ontario and the Rocky Mountains would be with our Northwestern States. These conclusions of

Mr. Seward are held by Mr. Glen to be as valid to-day as when published.

"AN EQUAL, AN HONORABLE UNION."

Mr. Glen proceeds to say that imperial federation, as a desirable and a practical solution of the future relation of the United States to Canada and the British Empire, has no substantial support in the Dominion. A federation of the several branches of the Anglo-Saxon race with the United States left out is, he declares, not worth a moment's consideration, and if attempted, in order to prolong Great Britain's control upon the continent, it will sooner or later lead to a war for the complete supremacy of the Republic in North America. Unrestricted reciprocity and commercial union as a settlement of the question are passed over as "unsubstantial dreams" so long as Canada remains a British dependency, and independence for Canada is considered practical only as a preliminary step toward continental union. Mr. Glen states as a result of his personal observation, covering a period of forty years, that the Canadian people are steadily becoming less English and more American in their habits, customs, sentiment, spirit, aspirations, institutions and legislation, and he makes the surprising statement that nearly one million native-born Canadians, or one-fourth of all living Canadians in the world, have become residents of the United States. "If," says Mr. Glen, "imperial federation, unrestricted reciprocity, commercial union, independence, *status quo* and 'an equal and honorable union' with the United States were offered to the people of Canada for acceptance or rejection through the ballot box, and after calm and free discussion in the press and upon the public platform a majority of the electorate would decide in favor of an 'equal and honorable re-union' with our neighbors upon this continent," and "if," he continues, "continental union is, as has been sent forth, one of the most important questions before the people of the United States and Canada, and its consummation will secure beneficent results to both of the great communities involved, there is not any valid reason why the more numerous and powerful people should not publicly declare their willingness to accept it as a final and peaceful solution of their relations with the less numerous and therefore less powerful people, nor is there any reason why either community should not use all lawful, peaceful and honorable means to hasten its consummation.

SUBMIT THIS RESOLUTION.

"If a large non-partisan organized body of American citizens, fairly representing those who create, control, and direct public opinion, should adopt and publish as an expression of public sentiment in this country a resolution similar to the following, it could not wound the feelings of the Canadian people, or

justly offend them, but would certainly hasten a solution of our relations to that great Anglo-Saxon community.

"Resolved, That we believe that the political reunion of the two great English-speaking communities, who now occupy and control North America, will deliver the continent from the scourge of war and dedicate it to the arts of peace, lessen the per capita cost of government and defense, insure the rapid development of its unlimited natural resources, enlarge its domestic and foreign commerce, protect and preserve its wealth, resources, privileges and opportunities, as the undisputed heritage of all, and promote, extend and perpetuate government by the people. We therefore invite the Canadian people to cast in their lot with their own continent, and assure them that they shall have all that the continent can give them. We will respect their freedom of action, and welcome them, when they desire it, into an equal and honorable union."

THE INCIDENCE OF TARIFF TAXATION.

IN the *Social Economist*, the editor, Mr. George Gunton, seeks to enlighten those who are in doubt as to "who pays a tariff duty; in what instances is it added to the price paid for a commodity by the consumer, and in what instances is it deducted from the price received for the commodity by foreign producers." Mr. Gunton clears the field by pointing out that each commodity affected by a tariff tax differs from every other commodity in the tariff schedule in the mode in which the duty will affect the price. If, he explains, the article be producible only abroad and must be imported, and if the demand for it will compel its importation, as in the case of tea, coffee, unrefined sugar and tropical fruits, the whole duty will be added to the price, but if it has been more largely and cheaply produced here than elsewhere, like hay, potatoes and grain, the duty will not affect the price in the least. "The tariff is merely the dam, and, like a dam, it can only raise a level where it crosses the flow of a vigorous commercial current. The whole nomenclature of the tariff discussion and the terms used in party platforms on both sides to define the nature of a tariff, such as 'tariff for revenue' and 'protective tariffs,' fall speedily into a mud-dle in any attempt to apply them to actual cases, because these terms assume a uniformity in the effect of duties when applied over many articles and in each article over long periods of time when any uniformity can exist as to either."

The following illustration is given to show when a tariff may be considered protective and when "for revenue:" "If a duty were imposed on the importation of wooden idols into an idolatrous country, of small constructive skill, the duty might yield a heavy revenue. Imposed by the United States it might be a dead letter, as none might seek importation. But if clergymen began to use them in illustration of their sermons on the heathen, an importation into the United States of the wooden idols would begin, and a specific duty on them of fifty cents each might begin

to yield a revenue, in which case the consumer—i. e., the preacher—would at first pay the whole duty."

THE INCIDENCE VARIES.

"The incidence of the duty," continues Mr. Gunton, "varies greatly in every tariff list. The best means of arriving at it is first to ascertain the rate of the duty from the statute; then take the last volume of our official reports of commerce, immigration, etc., and find out whether the article is one whose imports dominate over its exports, or *vice versa*. If it is one of insignificant import and large export, then the price in this country averages lower than abroad, and its major flow is outward. If it is one of large import and little or no export, its price abroad averages lower than here, and its average flow is inward. Then take the census of other statistics of domestic production, and by their aid compare the quantity of the importation with the quantity of the domestic production. If the importation is insignificant, the export large, and the domestic product is ten to twenty times larger than either, a strong presumption arises that the domestic production is the controlling factor in fixing the price, and that the cost per unit of product is lower here than abroad. In such a case, no duty on the importation can be very potential over the price. If, as in the case of crude sugar, our importation is eleven times as great as our product, the flow is inward and the tariff is a tax to the full amount of the duty. Upon crude sugar brought from Cuba, the American consumer (or refiner) pays the whole duty. Upon coal from Nova Scotia, he usually pays no part of it. Hence a duty on sugar is protective, on coal purely for revenue."

From these illustrations Mr. Gunton concludes that the question whether a duty is protective, or produces revenue, depends upon facts extrinsic to the law and growing out of prices and productions. "The pretense, therefore, that a statute can be constitutional one day and unconstitutional the next, according as some American may or may not produce a product which competes with that on which the duty rests, would be too absurd to be voted for, if all men understood the tariff question as well as they do their private business. A duty of fifty cents per pound on tea levied to-day would be wholly a revenue duty. Therefore, says a party platform, it is constitutional. But to-morrow, owing to the duty, some planter begins to produce it. Lo! instantly the duty, according to the same platform, has become protective, and is therefore unconstitutional. Perhaps the producer who thus changes a statute from constitutionality to unconstitutionality is a Chinaman or a tribal Indian, who has not even a vote. Such a view of unconstitutionality is itself unconstitutional in that it makes constitutionality of a statute to turn upon facts outside of the statute itself."

A GENUINE TARIFF FOR REVENUE.

In the editorial "Crucible" of the *Social Economist*, Mr. Gunton comments on the New York *Sun's* interpretation of what is meant by a genuine tariff for revenue, that paper holding that such a tariff is one

"levied alike upon all articles imported whether they are produced in the taxing country or not." Mr. Gunton's reply is that a genuine tariff for revenue only must be levied so as to yield revenue without any incidental protection to anybody. "There are only two methods of levying a genuine tariff for revenue only, neither of which form any part of Mr. Wilson's haphazard bill or Mr. Dana's horizontal thirty-five per cent. scheme. One is to confine the duties exclusively to non-competing products and the other is to levy the same duty upon home products as is levied for foreign products. Any pretended tariff for revenue only which does not adopt one or both of these conditions is a veritable sham born of ignorance and deception."

THE DEMOCRATIC TARIFF POLICY.

IN the opening article in the *North American Review*, Governor William E. Russell seeks to show that the recent business depression was due to Republican legislation rather than to impending Democratic legislation. After several pages of argument in support of this belief, Mr. Russell explains, as he understands it, the tariff policy of the Democratic party. He says: "This policy is a revenue tariff with a reduction of duty to cheapen the necessities of life and to give free raw materials to our industries. This it has declared in State and national platforms, formulated in bills and voted for in Congress. This it is pledged to give in its new bill, which means free wool, coal, iron ore and other raw materials and fair and proper reduction on finished products. The Democratic party says that every reason which made hides free demands that wool be free, and it proposes to act upon this belief. The great advantage of free silk to the silk industry, of free rags to the paper industry, of free hides to the boot and shoe and leather industries, can and ought to be extended to other industries as a benefit not only to all the people as consumers, but to the industries themselves, giving them a larger market here and a better chance to send their products into foreign markets."

A REVENUE TARIFF AND FREE RAW MATERIAL.

"This is the policy of the Democratic party as declared in its platforms, formulated in its measures and supported by its votes. It advocates a revenue tariff, remembering that revenue has been the basis of every tariff, even our war tariff, until 1888, when another principle, controlling the Republican party, supplanted it and found expression in the McKinley bill. It believes that a tariff which gives free raw materials and cheaper necessities of life, and which is required to raise a revenue of nearly two hundred million dollars, is a conservative measure and a benefit to industries as well as to the people. It does not believe in tariff taxation which has for its purpose and result taking from one to give to another, or burdening all to enrich the few. It opposes the principle of the McKinley

bill that taxation can be laid not for revenue, a public purpose, but solely for private interests, to kill competition, encourage trusts and cut off revenue.

"The country deliberately—emphatically—said in 1890 and 1892 that the Democratic policy was right in principle and would be beneficial in its results. It is hardly conceivable that its mature judgment, twice expressed, was wholly wrong. It certainly is no proof of this that a great business depression has come under another tariff policy, which by the same judgment the country condemned and ordered to be repealed."

A PLAN FOR AN AUTOMATIC TARIFF.

IN the *Forum*, Representative William J. Coombs, of New York, outlines and discusses the plan for revising the tariff which he introduced in the House of Representatives during the recent extra session. Mr. Coombs' plan is based upon the principle that taxes upon the people should not be in excess of the necessities of the government, and to this end provision is made for automatically adjusting the revenue derived from the tariff so as to supplement that yielded from other sources of taxation. Mr. Coombs would first ascertain what the requirements of the government are, and by deducting from that sum the estimated amount receivable from all other resources, find the amount necessary to be raised on imports.

HOW TO LEVY THE IMPOST WITHOUT DISTURBING COMMERCE.

The difficulty of Mr. Coombs' plan would be how to levy the impost without disturbing the commercial interest of the country. "Of course," he says, "if all articles could by their nature pay the same rate of import duty, the problem could easily be solved by fixing the percentage necessary upon the estimated amounts of imports. But all articles do not stand upon the same basis, and hence such a course would work great hardship. This consideration led to the suggestion of various schedules which should not share in the uniform rate of duty. The first was the free-list, toward the making of which the people have assisted Congress by their declarations at the last two elections, that all raw material necessary to the manufacture of goods should be admitted free of duty. The second schedule would embrace partially manufactured raw material such as must be used again in manufacture, and upon which the duty, even under the McKinley tariff, does not exceed ten or fifteen per cent. Since it would be manifestly unfair to those who pay internal revenue taxes to place them in the same schedule as those manufacturers who are not burdened with that tax, the articles on which an internal tax is levied, which are few in number, consisting chiefly of wines, spirits, cigars and tobacco, should pay a rate of duty which will bring a good revenue over and above the amount of the internal revenue on them."

Having eliminated all the foregoing class of articles from the list of importations, Mr. Coombs thinks that the remaining classes would not suffer by being sub-

jected to a uniform rate of ad valorem duty sufficient to meet the requirements of the government. This rate, he thinks, could be changed year by year as the sum of the necessary revenue required. The main objection to this arrangement is that it would subject the importation of the unspecified classes every year to a varying rate of duty; but Mr. Coombs holds that upon all goods to which the variable duty would apply it presents an obstacle no greater than the ordinary fluctuations which merchants have to confront every year. In order to ascertain how great this fluctuation would be, he has examined the estimates and expenditure of the government for three years in which there were the ordinary fluctuations, and finds that in no two years was there a difference of more than 5 per cent. He further estimates that in years of ordinary expenditure the duty necessary to be levied on the unspecified list would not be far from 35 per cent., and believes that this rate of duty, with the additional benefit derived from free raw material, would doubtless prevent the foreign competitors from unloading their surplus upon our own markets.

NECESSITY FOR IMMEDIATE TARIFF REDUCTION.

ALSO in the *Forum*, Mr. A. Augustus Healey argues for "Immediate Tariff Reduction." There is in delay, he holds, serious danger, not only to business, but to tariff reform itself. He thinks, moreover, that the financial panic through which we have just passed has furnished us an opportunity for putting a new tariff into effect with the least possible displacement and loss.

A new law reducing the tariff should, he holds, not only be passed, but should be made to take effect immediately, and for this reason: "The business world has known for a year that the tariff was to be revised and substantially reduced. Just what shape the revision would eventually take has not been known. There is warrant for the inference that raw materials will be made free of duty, accompanied by a system of graduated rates on manufactured articles, somewhat in proportion to their advance from the crude condition, due regard being had to the raising of revenue. But we are completely in the dark as to what will be the final form of the new tariff. It is simple justice to the great industries of the country that they should not be kept in suspense. The great majority of manufacturers are not at all afraid of a lower tariff. It will in reality be a great boon to them. But they are extremely impatient to know what it is to be in all its details. Now that financial confidence is fast becoming completely restored, our merchants and manufacturers are ready and desirous to proceed with energy and enterprise to recoup themselves for their losses during the recent crisis. But this they cannot do with intelligence and assurance until the new tariff has been enacted. The revival of business and industrial prosperity, therefore, and the welfare of millions of our countrymen dependent thereupon, to a very great extent now wait upon the action of Congress respecting the tariff."

THE SOUTH FOR A PROTECTIVE TARIFF IN 1896.

MR. GUY C. SIBLEY, writing in the *American Journal of Politics*, considers that it will not be a difficult matter to enlist the sympathy and votes of the South for a protective tariff. He says that the effect of the financial panic upon the newly developed industries of the South has made her ready and willing to go back and take up the protective tariff where she dropped it in 1856, and declares that if once the federal election law is repealed, and the pension laws are modified and the North will assure and convince the South that they shall remain repealed and modified, the South will be open for a discussion of the tariff. "Why should the South passively adhere to the free trade heresy? She is only at the outer portals of a temple of commercial wealth more substantial in its magnificent proportions than any earthly king has reared. She can manufacture more and produce it cheaper than the older iron and coal States of the North and West. Her coal is inexhaustible, and some of the largest deposits are nearer to tide water than any deposits in the world, except those in England. She is beginning to develop only the outer edge of immense timber forests, and is successfully competing with Canada in the Northern and Western markets.

HER INDUSTRIES NEED PROTECTION.

"Her orange crops are increasing every year, and her sugar and rice plantations, under the system of protection, are increasing in area. With such prospects in view, and while she is on the very threshold of prosperity, shall we now turn back, close her iron and coal mines, shut down her factories, cut down her orange groves, relegate her vast timber forests to decay and fire, and leave her sugar cane and rice fields to grow up in weeds? In 1843 Horace Greeley laid down five distinct propositions applicable to the protective system. Those principles are as sound to-day, in theory, as they were then. Under the practical test of more than thirty years they are simply impregnable. They are especially adapted to the present condition of the Southern States. Mr. Greeley submitted the following: First proposition—'A nation which would be prosperous must prosecute various branches of industry and supply its vital wants mainly by the labor of its own hands.' Second proposition—'There is a natural tendency in a comparatively new country to become, and continue, an exporter of grain and other rude staples, and an importer of manufactures.' Third proposition—'It is injurious to the new country thus to continue dependent for its supplies of clothing and manufactured fabrics on the old.' Fourth proposition—'That equilibrium between agriculture, manufactures and commerce, which we need, can only be maintained by protective duties.' Fifth proposition—'Protection is necessary and proper, to sustain as well as to create a beneficent adjustment of our national industry.'

"Suppose that the South should take unto herself and apply these principles to her present naturally favorable conditions. Under a protective tariff she has it in her power to shut down indefinitely the immense cotton manufacturing plants of Manchester

and Leeds. She has it in her power to bankrupt Fall River and Lowell and Pittsburg, unless they shall bring their manufacturing plants to the inexhaustible iron and coal fields and the almost limitless cotton plantations of the South. Instead of sending her cotton abroad at seven cents per pound, she can send it in the shape of thread or cotton yarn at fourteen cents, or in the shape of cloth at twenty-eight cents. In thus enhancing the value of her staple product 400 per cent., she not only brings into her borders that much increase in money, but she will have given employment to thousands of laborers, who are taken away from competition in other branches of industry. These are some of the reasons why the South should favor a protective tariff, and will be ripe for its adoption in 1896—and possibly in 1894.”

THE TARIFF ACT OF 1789.

WHETHER or not the federal government has constitutional power to impose and collect tariff duties except for revenue only, a right denied in the Democratic platform, it is clearly shown by Mr. William Hill, writing in the *Journal of Political Economy*, that the tariff act of 1789 was imposed with a view of protecting new manufacturing industries as well as to raise revenue for the government. And, more than this, it does not appear from the report furnished by Mr. Hill of the debate upon the measure that any member of Congress, at the time the bill was under consideration, questioned the authority of the government to levy taxes high enough to give any desired protection, or even to prohibit importations for the same purpose. The tariff of 1789 has generally been regarded as a revenue measure, and its low rates have been urged as a proof of its unprotective character, but Mr. Hill finds from an investigation of the subject three points of proof that the encouragement and protection of American manufacturers was at least as important as any other motive in securing the passage of the act which laid the foundation of the tariff system.

A PROTECTIVE AS WELL AS REVENUE MEASURE.

In the first place, Mr. Hill shows that the protective acts of the States furnished the experience on which the national legislators based their proceedings. Very soon after Congress first met, which was in April, 1789, Madison, recognizing the present need of revenue, offered a resolution calling for the adoption of the impost, which, from 1783 to 1789, Congress had in vain urged upon the States. Madison stated distinctly that the object of the measure was to raise revenue, that it was to be a temporary expedient, to remain in force only until a comprehensive system could be arranged. The act he proposed had been discussed in each State, and the opinions of the members as to its merits were already formed. As a substitute for the plan offered by Madison, Fitzsimmons, of Pennsylvania, proposed a system of protection similar to that which had been tried in his State. Both these plans were fully discussed, and after due deliberation the protective duties proposed by Fitzsimmons were preferred to the revenue duties advocated by Madison.

“Fortunately,” says Mr. Hill, “the evidence did not stop with the choice between the two measures. The Congress of that day did not merely decide upon the principles of a measure and then instruct a committee to prepare a bill in accordance with those principles, at least not on a question of first magnitude. Having determined that a protective tariff was necessary, the whole House proceeded to consider the details of such a measure. Of course the vast amount of business which comes before Congress in these latter days does not permit the full and free discussion which it was then possible to give to each important question. A tariff bill, with its numerous details—with the necessity of adjusting rates to suit the needs of great industries—can be prepared more advantageously by a committee of experts than by a body so large and unwieldy as the United States Congress has grown to be. If, however, Congress could again become a deliberative body, and if the reasons for supporting or opposing the details of a tariff bill could be given as freely as were the reasons for laying protective duties on the few articles which were deemed worthy of protection in 1789, there would certainly be less room for charges that contributions to a campaign fund secure or maintain protection. It may be necessary to buy protection now. It certainly was not a century ago. Then the existence, or the possible existence, of any industry was deemed sufficient reason for the encouragement which was openly and avowedly given. Each industry which had been started in any State, and which gave the least promise of success, was championed by the members from that State. At times they argued that the whole Union would gain by whatever benefited a part; again, that it was necessary to render the nation independent of foreigners, even at some present sacrifice; or again, that what was lost to any section by consenting to duties on one article should be made up to it by protection to its own products.”

NOT REGARDED AS UNCONSTITUTIONAL.

Mr. Hill states that the advocates of Madison's plan urged every other reason against its adoption, but never once did they say that protection to American industries would be unconstitutional or even undesirable. All through the reports of the debate presented by him is seen the desire on the part of the legislators of the first Congress to free American industries from the virtual monopoly England at that time held over the manufacture of products consumed in America, and the development by duties on imports of domestic resources.

“Whether,” concludes Mr. Hill, “the United States would have been a stronger rival of England if the industrial development which was well begun in 1790 had not been interrupted, is a purely speculative question. What the history of the time does indicate is that industrial conditions are more effective in securing laws than laws are in changing industrial conditions. The state of American commerce and manufactures from 1784 to 1790 certainly called for restrictive and protective legislation and secured it. But with a change of conditions the protective features of the tariff were not strengthened.

So long as the development was purely commercial all changes made in the tariff were for revenue purposes, and it was not till the close of the war of 1812, when the industrial conditions following the Revolution were repeated on an exaggerated scale, that protective legislation was again sought."

THE INCOME TAX.

MR. JOHN J. O'NEILL contributes to the *American Journal of Politics* a timely article on the subject "The Graduated Income Tax," in which he favors strongly the adoption of such a tax as a means of supplementing the revenue derived from the duties after the present session of Congress has revised the tariff. He makes light of all the objections that have been raised against the income tax. The justice and fairness of this tax is so apparent to Mr. O'Neill that he does not consider it necessary to be advocated by extended argument. This tax to be imposed ought, he thinks, be graduated in proportion to the amount of income, and he suggests that a tax of one per cent. should be imposed upon incomes of ten thousand dollars, the rate of tax increasing as the amount of income taxed grows larger, until an income of one hundred thousand dollars would be subject to a tax of ten per cent. Mr. O'Neill argues that a man who enjoys an annual income of one hundred thousand dollars can pay for the purposes of the state ten thousand dollars out of that income without experiencing the smallest hardship in being compelled to pay such tax.

NOT IMPRACTICABLE.

In reply to the charge that the income tax is impracticable, Mr. O'Neill calls to mind that in 1862 our government imposed an income tax, which was continued in force until December, 1871. This tax was at the beginning placed at three per cent. on incomes over eight hundred dollars, and at this rate the sum of twenty millions of dollars was raised in 1864, thirty-two millions in 1865, and by increasing the rate to five per cent. on sums over six hundred dollars and less than five thousand dollars, and ten per cent. on incomes in excess of the latter sum, nearly seventy-three millions of dollars was raised during the year 1866. Mr. O'Neill has no doubt that if an income tax were imposed at the present time it would yield an income far in excess of that derived from it thirty years ago. He shows that in Great Britain, with a population of only about thirty-five millions, about eighty millions of dollars was collected in 1888 by an income tax law, the rate at that time being eight pence on the pound, and the tax levied only on incomes exceeding one hundred and fifty pounds. He states, further, that in Italy, France and Germany experience with this form of tax has led to its permanent adoption.

Mr. O'Neill does not consider that such a tax would be any more open to the objection that it would involve an impertinent prying into the private affairs of a citizen and the necessity of the spy system than the present laws for taxing personal property, or the operation of our present custom laws.

THE JUSTIFICATION OF INTEREST.

THE question, Is it right to take interest?—once so laboriously discussed by mediæval casuists—is rising again to exercise the consciences of men. In the *Annals of the American Academy of Political and Social Science*, Mr. Arthur T. Hadley writes with the aim of showing "that the justification of interest, as an institution, is not to be sought either in the interest productivity of capital or in the difference of value between present and future goods; but in the fact that it furnishes a means of natural selection of employers whereby the productive forces of the community are better utilized than by any other method hitherto devised."

He traces three stages in the development of modern industrial law: "The first, where a man was allowed property as a stimulus to labor and save; the second, where he was allowed profits as a stimulus to exercise skill and foresight in management; and the third, historically almost coincident with the second, where he was allowed to offer interest to induce others to give him the means of exercising his skill and foresight over the widest range."

This is his summing up: "If these views be correct, interest is essentially a price paid by one group of capitalists to another, for the control of industry on a large scale. The system is justified by its effect in the natural selection of employers and methods rather than by any contribution made by the individual receiver of interest to the good of society. The rate of interest does not depend so directly as has been supposed on a general market for capital, but is the result of commutation of profits in particular lines; the terms of this commutation depending upon the relative numbers of those who desire control and those who are willing to part with such control for the sake of avoiding the risks which it entails."

INCREASING DIFFICULTY OF GETTING GOLD.

MR. T. A. RICKARD presents in the *Engineering Magazine* innumerable facts and statistics relating to the mining of gold, which, he holds, is growing more and more difficult each year. In the colony of Victoria, which yields two-thirds of all the Australasian gold, the output has decreased from 3,150,025 ounces in 1853, to 654,456 in 1892. This decline is attributed to the exhaustion of the rich alluvium, to the expense of quartz mining and the limited employment that could be given owing to the lack of capital. Mr. Rickard further says that in California as well as Victoria the rich alluvium has been for the most part exhausted, and he gives the following statistics showing the production from alluvial gravel and quartz veins in California. "In 1851 the entire product, 81,294,700, came from the alluvium, in 1881 it was 18,200,000, and about one-half was of alluvial origin. In 1892 hardly ten per cent. of the production was derived from the gravels. The obstacles raised to the carrying on of hydraulic mining, due to the filling of the river channels by tailings from the mines, caused an immediate diminution of the yield of from six

millions of dollars or more." Mr. Rickard's conclusion is "that while to predict the exhaustion of the gold supply is foolish, it is certainly true that the difficulty of getting gold is daily increasing."

'FEATS AND FOLLIES' OF AMERICAN FINANCE.

WITH characteristic plainness of speech and English prejudice about things American, the *Investors' Review* (London) discourses upon the financial methods of the United States.

"No country, ancient or modern," it affirms, "ever displayed a greater elasticity of resources" than was shown when the United States paid off in less than thirty years a debt of almost £400,000,000. This feat, and the small amount of local indebtedness, is attributed to the system of fixed dates for redemption. "Such a thing as a permanent irredeemable debt does not exist in the American Union." In this excellent management is traced "the influence of the old conservative ideas of the South."

"On the contrary, the Republican *régime*, which lasted unbroken in the Union down to the time of the first presidency of Mr. Grover Cleveland, is one of the least satisfactory manifestations of Republican government which is to be found in modern history. . . . It has been one of the most debased, debasing and corrupt democratic administrations the world has ever seen on a large scale."

The "pension" system is described as "the most gigantic system of public corruption which history has anywhere recorded."

WHAT HAS MADE PROTECTION POSSIBLE.

The effect of the economic principles which the United States has adopted is held to have been largely disguised by "the amount of European, and especially British, German and Dutch, money poured into the United States since the close of the Civil War," which is said to have exceeded one thousand millions sterling, and has "supplied the means by which the Union has been able to stand up under burdens which would have crushed any community, young or old, if left entirely to itself." Since the Baring crisis there has been "a slackening off in, if not complete withdrawal of, supplies of European moneys." This has made itself felt in the American crisis of the past summer. Continued for a year or two longer, "it would compel the States to fly to any expedient which will knock down the barriers standing between them and an enormous export trade." But "all the follies and economic blunders, all the social cankers of the American Union, are but trivialities beside the blood tax to which the leading nations of Europe have to submit in times of peace. In Germany, Austria, Italy and France, and to a smaller extent in every other European State, the devastation of an armed peace becomes every year more agonizing. They must be beaten in any industrial competition with the North American Union when it throws off its shackles."

The reviewer holds, therefore, that "the American people will come through their present currency and

other afflictions with little scathe," and "that the United States gives at the present time, and are likely to continue long to give, the best security available for British capital judiciously invested." But he also urges that "the British public ought to let the American people themselves find the money for new enterprises, no matter how attractively these may be put before them."

THE HAWAIIAN SITUATION.

THE *North American Review* contains this month three articles dealing with the Hawaiian situation. The first, by Mr. Eugene Tyler Chamberlain, is entitled the "Invasion of Hawaii." In this article Mr. Tyler attempts to show that the dethronement of Queen Liliuokalani and the establishment of an oligarchy on the island of Hawaii were encouraged, if not actually effected, by the presence of a considerable body of the naval force of the United States stationed in the immediate vicinity of the palace and government buildings, where the overthrow of the monarchy was consummated.

His report of the overthrow is as follows: "The recognized government of a nation with which we were at peace had officially notified Minister Stevens, our representative, of its ability to preserve order and protect property. The Vice-Consul-General of the United States, testifies that no uneasiness was felt at the consulate, and that the landing of the troops was a complete surprise to him. All the signs of street life betoken good order, and, soon after the blue-jackets had trailed their artillery through the streets the population of Honolulu was enjoying the regular Monday evening out-of-door concert of the Hawaiian band. The landing of the troops was promptly followed by the protests of the proper authorities of the kingdom and the island, transmitted officially to Minister Stevens. No evidence has been presented to Commissioner Blount to show that there was any apprehension or any desire for the presence ashore of the men of the "Boston" under arms, except on the part of the members of the Citizens' Committee of Safety. The matter was not referred to at the mass meeting of the foreign population, organized by that committee, and held but a few hours before the troops landed. The Committee of Safety, at whose request Mr. Stevens summoned the troops, did not prefer that request as American citizens.

"The Queen was dethroned and the oligarchy established by proclamation, read by a citizen of the United States, shortly before three o'clock, and recognized, in the name of the United States, by Minister Stevens before it was in possession of any point held in force by the Queen's government. With more prudence Captain Wiltse, in command of the 'Boston,' declined to recognize it until it came into possession of the military posts of the Queen, as it did by her voluntary surrender of them early in the evening. Her surrender was in terms 'to the superior force of the United States,' and 'until such time as the government of the United States shall, upon the

facts being presented to it, undo the action of its representative,' and on this understanding it was accepted by the junta."

Ex-Minister Stevens' Version.

Hon. John L. Stevens, recently United States Minister at Hawaii, follows with "A Plea for Annexation." After reviewing the events which led to the downfall of Queen Liliuokalani, which Mr. Stevens holds was brought about by her open defiance of the opinions and advice of the best men on the islands, he gives the following version of the establishment of the provisional government: "Amid the exciting events in Honolulu following the revolutionary attempts of Liliuokalani to proclaim a despotic constitution, by which she flung away her crown, a small force of marines and sailors was landed from the United States ship 'Boston,' as a precautionary step for the protection of American life and property, and as a safeguard against night incendiarism stimulated by the hope of plunder, greatly feared by many of the best citizens. This was doing precisely what has been repeatedly done in previous exciting days in Honolulu, during a period running back many years. The men of the 'Boston' came on shore nearly fifty hours after the fall of the queen, in whose defense no effective aid was offered by those who had surrounded her in her carnival of immorality and official corruption. The naval commander and the United States Minister earnestly sought to faithfully carry out the prior rules of the Legation, especially those contained in the last instructions issued to the United States Minister and naval commander, by Secretary Bayard, July 12, 1887. Neither by force, threats, nor intimidation, did the United States officials oppose the fallen queen or aid the provisional government, the latter being supported by the same men, with now increased numbers, who found it imperatively necessary to take despotic power from King Kalakaua in 1887, by the adoption of the reformed constitution, and who crushed out the Wilcox rebellion in 1889. All assertions to the contrary as to the action of the United States officials and marines are absolutely untrue and certain to be swept aside by time and history, however plausibly stated and however strongly these assertions may be supported by the perjured testimony of persons deeply compromised by the vices and unlawful actions of which they had been guilty before Liliuokalani lost her throne."

Restore the "Status Quo."

In the third article Hon. William M. Springer, of Illinois, maintains that it is not a matter of concern of the American people whether the government of Hawaii was a just one, a moral one, or an efficient one, and that we have no more right to overthrow a monarchy in Hawaii because it does not conform to our ideas of a just government than we have to overthrow a monarchy in Canada or Great Britain, or Russia or Turkey, or Spain or elsewhere. The claim that the presence of the United States forces on shore was necessary to the protection of American life and

property can, in Mr. Springer's opinion, only be supported on the assumption that American citizens were actually in danger in their persons and in their property while peacefully pursuing their business there, and he asserts that no foundation whatever existed for this claim. He states flatly that the people of the United States are not responsible for the kind of government in existence in Hawaii and that it is no concern of theirs whether the government deals justly with its citizens and subjects or not. "Whether the government of Hawaii is a good government or a just government is a matter for the people of that island to determine for themselves. There is no divine right of republicanism in this world, any more than there is a divine right of kings. The divinity in all these matters is in the right of the people to govern themselves."

WHAT RIGHT HAVE WE TO INTERFERE?

"Our own right to self-government is no more sacred than the right of the handful of ignorant Hawaiians in the Sandwich Islands to govern themselves. If they prefer a monarchy, feeble and inefficient though it may be, it is their business, and not ours. But it is claimed that the provisional government is one composed of Christians, and that they are representatives of advanced Christian civilization. The United States, being a Christian nation, should sympathize with and render moral and material aid in sustaining that government; and it is alleged that we have no right to consent to its overthrow. It may be conceded, for the sake of argument, that the provisional government is composed of Christians, and that it more nearly corresponds to our ideas of a just government than does the government of the monarchy, but, as suggested before, this is foreign to the controversy. We have no more right to interfere on this ground with the government of Hawaii than we have to interfere with the government of China or Japan or Turkey."

REDRESS THE WRONG.

"The question is frequently asked in partisan papers, 'How can the monarchy be restored?' Or, 'By what right does the government of the United States assume to re-establish a monarchy which has been overthrown?' The government of the United States has no more right to establish a monarchy in Hawaii than it has to establish one in Mexico or in Central America. But it is the duty of the United States government, when its agents and representatives have committed a wrong against the government of a friendly power, to redress that wrong, and in this case it can only be accomplished by placing the government in *status quo*, or in the condition in which it was found at the time the armed forces of the United States were landed upon Hawaiian soil and interposed in the local affairs of the monarchy. We cannot redress the wrong we have committed by merely withdrawing our forces after they have been used for seventy-five days to suppress the existing government and establish a provisional government

in its stead. We must restore to the queen her own armed forces and we must disarm the forces of the provisional government which were armed and equipped by the aid and under the protection of our navies. Anything short of this is a mockery of justice, a disgrace to our diplomacy, is unworthy of a Christian nation, and a travesty upon our devotion to the principles of local self-government.

"If the restoration of the *status quo* which existed prior to the landing of our forces on Hawaiian soil should result in the restoration of the monarchy, such restoration would only demonstrate the fact that the overthrow of the monarchy was due to our intervention. If it does not result in a restoration of the monarchy, then we have washed our hands of responsibility in the matter, and have vindicated the integrity of our diplomacy and the high character of our government as one which loves justice and maintains international comity. Therefore, it is not the restoration of the monarchy which is in issue, but it is the restoration of the condition which existed prior to the armed intervention of the United States. Justice requires that our government should go back thus far, and when we have thus done justice we are not responsible for the injustice that others may do. We must maintain our integrity as a nation. We must vindicate our regard for the rights of a weak and defenseless government."

OBSTRUCTION IN THE SENATE.

COMMENTING editorially upon the "Obstruction by the Minority in the Senate," the *Yale Review* says:

"Condemn as we will the conduct of the Senators from the silver States, for thwarting the wishes of the country for the sake of a locality—they are only doing in a flagrant case the same sort of thing which is done over and over again in River and Harbor bills and other expenditures of public money. The average Congressman thinks of the good which comes to his district, and not of the harm which comes to the public treasury. If the district can gain at the expense of the nation he deems it his duty to promote such gain. We have had a case of this sort in Connecticut in the last few weeks, where certain towns had paid a large sum of money to have a certain bridge transferred from the charge of the towns to that of the State. The circumstances attending the payment of the money were suspicious; yet most of the towns concerned refuse to investigate the matter for the thinly disguised reason that they got more than their money's worth out of the State treasury. So dear is the privilege of appropriating general funds to special uses that the beneficiaries of such a process shut their eyes not only to the real character of the transaction, but to the means by which it is brought about.

"The silver question in its present form offers an instance of the same general sort. The silver mining districts seem to gain by the continuance of silver purchase; therefore the Senators exhaust every means

to continue such purchase in defiance of the expressed will of the rest of the country. But in the light of Congressional traditions, why should they not do so? If it is right to convert the capital of the country to local or partisan uses under pretext of legislation, it is a very slight sin to exhaust every parliamentary resource to prevent the majority from repealing such legislation."

How to Deal With Filibustering.

Considering, in the *Forum*, the question "How to Deal with the Filibustering Minority," Mr. John B. McMasters, the well-known American historian, suggests as an effective means that of setting a limit to the time of debate on any given subject. The very fact that a minority exists is held to be the best of all reasons for hearing it, but no reason for permitting the minority to prolong debate indefinitely. "A minority is not to be considered as factious till it ceases to be reasonable and becomes factious. A majority can very easily be in the wrong and ought under no circumstances to act hastily, nor until that great safeguard of representative government, freedom in debate, has been fully respected. The provision, therefore, should be made in full recognition of the fact that a majority may be arbitrary as well as that a minority may be factious; and a certain time fixed during which time no gag, no previous question can apply, and after which a vote must be taken." He does not think it desirable or possible that such a provision should be put in the constitution of the United States, nor does he think it necessary. Obstruction by the minority has been successfully dealt with by Mr. Reed and Mr. Crisp in the House and, declares Mr. McMasters, may be as successfully dealt with in the Senate.

THE PROBLEM OF THE UNEMPLOYED.

THE ever-recurring question of how to deal with the unemployed is treated by Canon Barnett in the *Fortnightly*, and by Mr. J. A. Murray Macdonald, M.P., in the *New Review*. Mr. Macdonald begins by pointing to the effect which machinery has had in increasing the number and relatively decreasing the employment of the population. He contends: "1, That the proportion of the population of the country that finds work in the staple industries is decreasing, while the wealth produced in them is increasing; 2, that the increase in the population does not obtain work under satisfactory conditions in other channels of labor; 3, that the oversupply of labor cannot justly be traced to any fault of the laborer, but to a cause, operating in our industrial system as a whole, over which the laborer has hardly any control."

PUBLISHED ACCOUNTS AND COLLECTIVE CONTROL.

The remedy he advocates is "the substitution of such an organization of industry as would lead to a due balance between distribution and production, in place of the present wasteful overproduction."

To this end we first require knowledge of the actual demand and actual supply of a given commodity.

Export and import returns are not enough. "What is needed is a detailed account of the business of each particular firm in each particular industry of the country, and the collection and analysis of these accounts." In order to obtain a balance between the demand and supply of commodities thus ascertained, Mr. Macdonald advocates "the collective control of the production of any particular commodity by the whole body of the producers of that commodity;" for example, "the collective control of the whole cotton industry of the country by the whole body of those actually engaged in it," or the combination of the Miners' Federation and the Federated Mine Owners. Such an amalgamation would make the miner's connection with the mine as stable as is the mine owner's. His third specific is the eight-hour day for certain trades.

Canon Barnett's View.

Canon Barnett divides the unemployed into two classes, those unable to work and those unwilling to work, requiring respectively relief and discipline. "The danger at hand is," he thinks, "not so much one of abnormal distress as of antagonism." He does not find a solution in shorter hours or new public works, or the holding over to the slack times of winter of all work that can be so arranged, or farm colonies; he condemns outdoor relief to the physically unfit, and "shelters and feeding." He approves of the proposal. "1, That training be offered by Boards of Guardians to all willing to submit for a certain time to certain regulations; 2, that the parochial authorities reserve its street work—sweeping, cleaning, etc.—for inhabitants in its own district who have occupied tenements for at least twelve months, and that such work be strictly supervised so as to ensure the performance of a full day's task; 3, that those who refuse training and fail at street work be offered the workhouse."

"The Whitechapel guardians are proposing as an experiment to offer willing, able-bodied men—inhabitants of Whitechapel—work on farms in Essex."

"DO ONE GOOD THING."

The Canon's final advice is to trust less to machinery and more to personal friendship: "The one thing which every one can do and be certain of its use is to make friends with one or two who are in need—to do all necessary for this one or two, and leave off attempting to raise the masses. There would be perhaps more self-denial in the self-restraint than in the sacrifice. It is often less hard for many in these days of bold advertisement to spend themselves on platforms and at street corners, to stand night after night in close rooms feeding hungry hundreds, than to restrain themselves in order to do one good thing. If to-morrow every one who cares for the poor would become the friend of one poor person—forsaking all others—there would next week be no insoluble problem of the unemployed, and London would be within measurable distance of becoming a city of happy homes."

GOVERNMENT CONTROL OF RAILROADS.

A STRONG argument for the government control of the railways and the telegraphs appears as the opening article in *Electrical Engineering*, the writer being Mr. W. S. Crosby. State control, in Mr. Crosby's opinion, is a theory which cannot be successfully applied in practice. He says in substance: The theory proceeds along the line that the railway should at least do more adapting and that State control can secure that result better than private ownership will do. It being manifest that as a rule a person owning a useful thing can and will insure a better adaptation of it than if some one else owned it, then follows as a plausible theory that any number of persons owning a thing can and will insure to themselves a like advantage, and from this it is but a step to the conclusion that by owning railways the whole people can and will insure to themselves an advantage thereby.

THE GREAT DIFFICULTY.

But the process of adjusting the service of railways to the needs of the people, while it is a process that must go on, is, continues Mr. Crosby, one that is susceptible of acceleration or retardation, and it is one wherein unlimited adaptation on either side is impossible. The rate of adaptation depends upon the efficiency of the management of the railway to that end, and the mere transferring of the title to the whole people will not enlarge its powers in that direction. Then Mr. Crosby proceeds to tell why the people cannot manage railways so efficiently as private owners. "If the people own the railways, the people must manage the railways. How will they do it? By delegated authority. Authority must be limited or it must be unlimited. If the delegated authority of the people for the management of its railways were unlimited, the world had never yet seen the concentration of power that would be in the hands of the man or men who would possess it, and the man has yet to be born who could wield that power to the satisfaction of the people. If that authority is to be limited—and it certainly would be—how and by whom are the limitations to be set? By the people—and that sounds well; through a vote of Congress—and that don't sound so well. That power would be limited by law. Granting that every member of Congress is honest, for which admission may God forgive me; and granting that every member knows the needs of his own constituency in the matter of railway service, for which admission may their constituencies forgive me, even then, what kind of a regulation power for the railways of the United States would acts of Congress be? The question to be decided is the adaptiveness of the railway service to the varied and variable needs of the people; and that adaptiveness lies in the regulative apparatus of the railways, and that regulative apparatus is controlled by law. But a thing to be adaptive must be flexible. Did anybody ever notice anything flexible about a statute law, or a legislative regulation? In

the whole social structure, excepting the immutable laws of matter and of force, there is nothing so inflexible as written laws. Common law, customs, habits, fashion, all undergo incessant adjustment to contacts with surrounding things; even prejudices are perceptibly modified by changed conditions; but statutes are the same to-day, to-morrow, and for everlasting—or, strictly speaking, until the sluggish action of the legislative body sees fit to modify or repeal them, which amounts to about the same thing."

Mr. Crosby concludes: "The advocates of State control propose to abolish the unceasing and infinitely flexible force—competition, and to put in its place the sleepest and most inflexible force of the whole social body—legislative-made laws. If this were done can any man compute the loss?"

THE CAUSE OF STRIKES.

MR. ARTHUR A. FREEMAN concludes an article on the "History of Strikes and Lock-outs in America," appearing in the *Engineering Magazine*, with the firm conviction "that these labor conflicts cannot be due to the conspiring body of a few selfish agitators, but must be inevitably the results of the system of free industries." He finds since 1886 that labor organizations have lost considerable ground, and that to-day even the most powerful unions find it impossible to get their demands by great strikes and "tie-ups," but he has also discovered that the dangers and evils of collisions between employers and workmen are greater now than they ever were. "The old trades-unionist had no sympathy whatever with State socialistic notions, and was careful to disavow his responsibility for revolutionary attacks on the fundamental principles of industrial society. He merely insisted on what seemed to him 'a fair day's wage for a fair day's work,' and repudiated the radical programme of expropriation and abolition of private enterprise. He had no quarrel with free competition, property, profits, or the right of the employer to be his own master. He claimed the right to strike, to boycott, and to act in concert with his fellows; but he did not, theoretically, go any greater length. He occasionally resorted to violence, but this was done in the heat and excitement of struggle, and no justification was ever attempted of any destruction of property or interference with liberty. To-day, however, a totally different spirit pervades and controls the world of organized labor. The 'new unionism' has virtually espoused the State socialistic doctrine that free competition and private enterprise are incompatible with the interests of labor, and strikes are regarded as the preliminary encounters which hasten the inevitable final conflict between capital and labor. The more desperate the situation, the greater the danger of violence and reckless disregard of bounds set by justice or law. It behooves us, therefore, to give earnest consideration to the 'labor problem,' and by securing to labor its due, deprive it of all excuse for aggression. To avert State socialism, it is necessary to establish economic justice and equal freedom."

CAUSES OF FAILURE IN "BOOM" TOWNS.

IN the *Engineering Magazine*, Mr. H. S. Fleming reviews the history of "boom" towns in the years between 1884 and 1889. The secret of the failure of "boom" towns is attributed to "the fact that promoters and investors discounted the future while deliberately closing their eyes to the present. They disregarded the common rules of business with a persistence and blind obstinacy truly marvelous. Never stopping to reason, they plunged into a sea strewn with half covered reefs of financial ruin, and allowed the wind of excitement and enthusiasm to blow them about at will, and when they finally struck a rock and were wrecked, they blamed not themselves, their greed, or their blind impetuosity, but the town, its overestimated resources, and everything else which failed to meet their hopes, forgetting that the facts were before them all the time."

DISREGARD OF BUSINESS PRINCIPLES.

In the opinion of Mr. Fleming, 90 per cent. of the towns "boomed" in the Southern States, which have proved failures, would now be in a healthy and prosperous condition had they been started and carried on in the manner usual in business enterprises. "As it is," he says, "the collapse of the 'boom' together with the past three years of financial depression has dealt them a serious blow from which they have been slow to recover. A movement for the better started some time ago, but it has been slow, very quiet and very earnest. Big factories and works have changed hands, the new owners securing them for a small part of the original cost and starting with a limited force, producing only as much as can readily and profitably be disposed of. This movement is general, and is the precursor of a substantial industrial growth which will soon be beyond the reach of 'booms' or any other undue inflation of values."

Mr. Fleming asserts that there have been few towns boomed in which some real merit did not exist, and believes that had the promoters been willing to go to work on a legitimate basis, great good would have resulted where there is now ruin. "The reason why these boom towns have failed to succeed according to the expectations of the promoters will be apparent after a moment's consideration of the conditions necessary for the growth of a town. Basing its prosperity upon its possibilities as a manufacturing centre and granting that it possesses all the resources and railway facilities necessary for such purpose, it must secure the establishment of various manufacturing enterprises. These will need many employees, who will buy provisions, household goods, clothing and the various necessities of life from stores. In this way the basis of mercantile business is established. To carry on the business banks are necessary for convenience and safety in handling money. Thus the financial end is founded. This is the theory of boom towns, but it is too nearly elysian to be found in practice. In the first place, the enterprises secured were not altogether adapted to the par-

ticular resources of the place and those which were not had a small chance of succeeding, and those which were so suited were almost invariably started on such an extensive scale and so hampered with enormous capitalization bonds and debts that in a financial sense alone their continuance was doubtful."

THE MISSION OF THE POPULIST PARTY.

IN the *North American Review*, Senator Peffer, of Kansas, sets forth "The Mission of the Populist Party."

DEMANDS OF THE PARTY.

He summarizes as follows the demands of the party:

"1. An exclusively national currency in amount amply sufficient for all the uses for which money is needed by the people, to consist of gold and silver coined on equal terms, and government paper, each and all legal tender in payment of debts of whatever nature or amount, receivable for taxes and all public dues.

"2. That rates of interest for the use of money be reduced to the level of average net profits in productive industries.

"3. That the means of public transportation be brought under public control, to the end that carriage shall not cost more than it is reasonably worth, and that charges may be made uniform.

"4. That large private land holdings be discouraged by law."

The charge made against Populists that they favor paternalism in government is refuted by Senator Peffer. "They only demand," he says, "that popular functions shall be exercised by public agents, and that sovereign power shall not be delegated to private persons or corporations having only private interests to serve. They would popularize government to the end that it may accomplish the work for which it was established—to serve the people, all the people, not only a few." If it be paternalism, he asks, to require the government to look after any of the private interests of the people, why do we not drive from our grounds as a tramp the postman who delivers our mail?

THE ONLY PARTY IN FAVOR OF GOOD MONEY.

Senator Peffer declares that the Populist party is the only party that honestly favors good money. "Democrats and Republicans alike declare their purpose to make all dollars equally good and to maintain the parity between them, and the recent act of Congress repealing the purchasing clause of the Sherman law contains a similar declaration; but when an amendment was proposed to the bill in the Senate to make good the platform promises by incorporating them in the law, there were not enough Senators in favor of it to secure a yea and nay vote on the amendment. We have seven different kinds of money, and only one of them is good, according to the determination of the Treasury officials—gold coin; and Republicans and Democrats are agreed on continuing that

policy; while Populists demand gold, silver and paper money, all equally full legal tender.

"It is evident," Senator Peffer continues, "that we must have more money, and Congress alone is authorized to prepare it. Populists demand not only a sufficiency of money, but a reduction of interest rates at least as low as the general level of the people's savings. They aver that with interest at present legal and actual rates, an increase in the volume of money in the country would be of little permanent benefit, for bankers and brokers would control its circulation, just as they do now. But with interest charges reduced to three or two per cent. the business of the money lender would be no more profitable than that of the farmer—and why should it be?

GOVERNMENT RAILROADS.

"While the Populist party favors government ownership and control of railroads, it wisely leaves for future consideration the means by which such ownership and control can best be brought about. The conditions which seem to make necessary such a change in our transportation system preclude all probability of its ever being practicable, if it were desirable, to purchase the existing railway lines. The total capitalization of railroads in the United States in 1890 was put at \$9,871,378,389—nearly ten thousand million dollars. It would be putting the figures high to say that the roads are worth one-half the amount of their capital stock. This leaves a fictitious value of \$5,000,000,000 which the people must maintain for the roads by transportation charges twice as high as they would be if the capitalization were only half as much. It is the excessive capitalization which the people have to maintain that they complain about. It would be an unbusinesslike proceeding for the people to purchase roads when they could build better ones just where and when they are needed for less than half the money that would be required to clear these companies' books. It is conceded that none of the highly capitalized railroad corporations expect to pay their debts. If they can keep even on interest account they do well, and that is all they are trying to do. While charges have been greatly reduced, they are still based on capitalization, and courts have held that the companies are entitled to reasonable profits on their investment. The people have but one safe remedy—to construct their own roads as needed, and then they will 'own and control' them.

"This is not a new doctrine. A select committee of the Senate of the United States, at the head of which was Hon. William Windom, then a Senator and afterward Secretary of the Treasury, appointed in December, 1872, reported among other recommendations one proposing the construction of a 'government freight railway,' for the purpose of effectively regulating interstate commerce. A government freight railway would have no capitalization, no debt, bonded or otherwise; its charges would be only what it would cost to handle the traffic and keep the road in repair. That would reduce cost of carriage to a minimum, and nothing else will."

DO WE PAY OUR OFFICIALS ENOUGH?

IN the *American Journal of Politics*, Mr. Charles Robinson argues to show that we are stingy to the last degree in the allotment of cash remuneration to our powers that be. He thinks that this is perhaps most decidedly the case with our ambassadors, and that \$17,000 per year for a first class diplomatic representative is a pittance which will allow only the richest men to take such positions. The establishments which these gentlemen have to keep up to do credit to us cost far more than this amount of money. Mr. Robinson tells us that the French Ambassador to England has a salary of \$60,000 and still his necessary expenses encroach upon his private fortune, while Sir Julian Pauncefote, British Ambassador at Washington, gets \$30,000 a year and a house free. This writer thinks that it is no uncommon thing for our ministers to be put to an actual expense per year of \$100,000, and if that is the case, we can well believe his statement that the appointment to an embassy is a most costly luxury.

Not only with foreign representatives but also with our home officials are we, according to Mr. Robinson, niggardly to an unwise degree. He doesn't think \$8,000 a year sufficient for a cabinet officer who is expected to live at the rate of \$20,000 a year or more.

AS COMPARED WITH ENGLAND.

"As a matter of fact, most of the best talent, as well as the stanchest integrity, is to be found among men of small means. The consensus of opinion seems to be overwhelming that the pay of our cabinet ministers should be largely increased, and it is to be hoped that when Congress comes to deal with the subject it will show a generous disposition. The English secretaries of state get \$25,000 a year each, and, after serving five years, are entitled to a pension of \$10,000 a year for life. Indeed, many of the under-secretaries and clerks in the English departments receive larger salaries than our cabinet officers. During the last session of Congress a bill was passed cutting down the salaries of the assistant secretaries from \$4,500 to \$3,500. This is certainly a move in the wrong direction. So again, while our attorney and solicitor-general only get \$8,000 and \$7,000 salary respectively, the English law officers of the same rank receive \$35,000 and \$30,000 a year, and until this year were permitted to continue their private practice. Under pressure from Mr. Gladstone, however, they have relinquished that privilege, but they still receive in addition to the salary, fees for contentious business.

COULD OUR BEST LAWYERS BE JUDGES?

Mr. Robinson thinks it is rather too much to expect our lawyers of the first class, who have practices worth \$50,000 a year or more, to elect to become judges at one-twelfth such an income, and he thinks that many prominent lights of the legal profession are debarred from doing public service because they cannot afford it.

"Imagine Mr. Choate, Mr. Parsons or Mr. Coudert throwing up their private practice for a judgeship

with a salary about equal to that paid some of their own clerks!

"The judges of the United States Supreme Court receive but \$10,000 a year, while the salary of the Chief Justice of the United States, our highest judicial officer, is only \$10,500. Not long since it was rumored that Chief Justice Fuller intended resigning in order to accept the position of counsel to an Illinois railroad company, at a salary which would enable him to leave something to his family in the event of his death. The possibility of such a rumor being true is a national disgrace. The salary of the Lord Chief Justice of England is \$40,000 a year, while the Lord Chancellor receives \$50,000 a year while in office and a pension of \$25,000 for life. The lords of appeal receive \$30,000 a year, and all the other judges get \$25,000. No matter how high a position a man attains at the English bar, his ambition is a seat on the bench. What a change would come over the judiciary if the leaders of our bar could only be induced and encouraged to accept office! This can only be done by a liberal increase in the salaries now paid to our judges.

"It is the same story all through the bluebook. The United States commissioner of education only gets \$3,000 a year. In England the same officer receives \$10,000. Our patent commissioner gets \$2,500 a year less than the English commissioner, whose province is so much smaller. The commander-in-chief of the British army gets \$33,000 a year; the general commanding the United States army receives nothing in addition to his salary as major-general, which is only \$7,500. So again, a rear admiral in England receives \$13,600; with us he gets \$6,000 when at sea and \$5,000 when on shore duty. The speaker of the House of Commons gets \$25,000 a year and a house free; the deputy speaker gets \$12,500, and the clerk of the house gets \$10,000, while the clerk of the House of Lords gets \$15,000. The secretary of our Senate, which is the equivalent position here, receives but \$6,000, and the clerk of the House of Representatives gets \$5,000. The speaker and the president *pro tem* of the United States Senate get the same as the vice-president, \$8,000, which is only \$3,000 in addition to their salaries."

HOW TO FIND THE MONEY FOR OLD AGE PENSIONS.

MR. M. Q. HOLYOAKE reinforces, in the *Humanitarian*, his favorite scheme for "the taxation of pleasure," with a view to providing the funds requisite for old age pensions. He proposes to lay a tax of one penny in the shilling on every ticket for admission to the theatres, race meetings, and other places of amusement. He quotes a number of favorable opinions he has received, among others, from the late Lord Iddesleigh, the late Lord Addington, the Earl of Meath, the Bishop of London, Lord Compton, Mr. Herbert Gladstone, Mr. Thomas Burt and Rev. H. Price Hughes. He urges as the advantage of such taxes that they fall on the surplus money of the people; on unproductive labor, and would hardly be felt at all.

THE MANNERS OF THE HOUSE OF COMMONS.

JUSTIN McCARTHY, in the *North American Review*, attempts to convey to the American mind a clear understanding of the ways of the House of Lords and House of Commons.

The chief distinction he draws between the House of Commons and other political assemblies of representative men is that the House of Commons alone has the practice of not providing seats enough for its members to sit down in. "You may be elected to the House of Commons by an overwhelming majority of voters. Your return may be recognized as valid and certain beyond the possibility of petition or adverse decision from the judges who deal with questions of electoral law. You may have been formally introduced to the House of Commons by two political comrades, one walking at either side. You may, thus escorted, have walked up the floor of the House to the table where the gowned and wigged clerks are sitting just under the august throne of Mr. Speaker. You may have handed in the certificate of your election. You may have signed the roll. I wonder why one's hand shakes as he signs that roll. I have signed it, I think, six times at successive elections, and my hand always quivered in the process. You may have sworn the prescribed oath and shaken the Speaker's hand of formal welcome. And yet have you found a seat in the House of Commons? Nothing of the kind. You are a member of the House, to be sure, just as much as Mr. Gladstone is—but have you got a seat in the House? No, you have not—at least, you have not got a place to sit down in.

"The House of Commons has some six hundred and seventy members, and it has seats for little more than half the number. Even if we take into account the members' galleries, which run along two sides of the chamber, there still is not nearly room enough for all the men who are entitled to take their places in the House of Commons. What are the members to do who have not got seats? They are to do the best they can—to do anything they like short of taking seats in the House. They may crowd the bar—I do not mean any place of refreshment, although they may crowd that bar, too, if they please; I mean they may stand below the line which is supposed to represent the brass bar that can, when occasion requires, be drawn out from either side, and so conjoined as to represent the division between some petitioner, or some alleged offender, and the House of Commons itself. They may stay in the newspaper room or the tea room; they may fall asleep in the library; they may walk on the terrace; they may lounge in the smoking room, but they cannot sit in the House. As in England there are so many superfluous women who could not possibly find husbands here, under our present matrimonial system, so in the House of Commons there are so many members who cannot possibly find seats. The struggle for seats from day to day is a curious and interesting competition, of which, so far as I know, the English House of Commons has an absolute monopoly.

"In every other parliamentary assembly that I know of, each member has his assigned and recognized place, which he holds until the end, either of the session or of the parliament. In most other parliaments that I know of, each member has a desk to write on while the House is carrying on its debate. In the House of Commons there is no desk for any member, and the rule is that no man is to write a line or take a note or read a book or a newspaper in the debating chamber itself, except for the actual purposes of that debate. You may take a note of something said in the speech of a man to which you propose to reply. You may hold in your hand a cutting from a newspaper containing an account of some facts by which you propose to strengthen your reply. But you must not write an ordinary letter or glance for your own amusement at a book or a newspaper. If you venture to do anything of the kind you have the Sergeant-at-Arms down upon you at once with gentle but firm admonition.

"I have never quite understood why the House of Commons should be considered a highly orderly assembly. I never, during my long acquaintance with the House of Commons, could understand where its title to be considered an orderly and decorous legislative assembly came in. The recent riot—for it was nothing short of a riot during the short time it lasted—in the House of Commons, was mainly caused by the fact that men were pent up so closely together that the movement of one man from his place suggested to another man that he who first sought to push his way through must have had it in his mind to assault somebody. But without considering the recent riot the House of Commons is almost the noisiest and rudest legislative assembly with which I have any manner of personal acquaintance.

Mr. T. P. O'Connor's Account.

A vivid and valuable description of "The House of Commons: Its Structure, Rules, and Habits," is contributed to *Harper's* by Mr. T. P. O'Connor, M.P. It is an interesting instance of what may be termed the comparative study of legislatures. Beginning with the attendance at prayers, Mr. O'Connor explains Mr. Labouchere's regular and "pious attention" to the chaplain's ministrations on the ground of his wanting to secure his favorite seat, and "the rule is inflexible that a seat can be held only for one night, and that then it shall be won by attendance at prayers." The cry of "Speaker, Speaker," which heralds that official's entry into the House, is described as "a shout which has a strange indefinable effect, however often heard, and stirs the blood somewhat as the dreams of De Quincey were moved by the recollection of the Roman consul passing over the Appian Way. It sounds like a reminiscence and momentary embodiment of all the fierce struggle, oratorical triumphs, tragic and world-shaking events which are associated with the history of the august Parliament of Great Britain."

DESK OR NO DESK.

On this question Mr. O'Connor pronounces a trifle unexpectedly: "A striking difference between the House of Commons and the legislatures of America is that the House of Commons has no desks for its members. They sit close beside each other, with nothing but the back of the next bench in front of them. There is a small receptacle in front where one can lay a few papers, but, as a rule, the ordinary member of the House of Commons has nowhere to hold his papers save in his hands—that is, while he is in the House. . . .

"The first thing that struck me in the House of Representatives when I visited it was the much larger attendance there than in the House of Commons. Except at certain hours of the evening, when the business is rather exciting, the attendance in the House of Commons is very small, not usually as many as the quorum of forty; whereas in Washington the greater number of the members are usually present—at least throughout a good portion of the day.

"The second thing that struck me at Washington was the amount of noise. It seemed to me impossible that any man could speak amid the din by which he was surrounded. There is as much noise in the House of Representatives, whenever even a good speaker is addressing it, as there is in Westminster when everyone is engaged in putting down a bore. This is largely due to the fact that the members in Washington are busy with their correspondence, and therefore can distract their attention from the speaker. . . .

"On the whole I prefer our system; and so, I believe, do some of the leading men of the American Congress. I had a conversation with Mr. Reed while he was Speaker of the House of Representatives, and I understood him to say that he thought the abolition of the desk would lead to a reform in the methods of the House of Representatives. The absence of the desk certainly concentrates the attention of the House on the speaking, and in that way makes speaking more actual and debating more real."

"RESPONSIVE AS AN ÆOLIAN HARP."

After observing that "though there is ample accommodation for dining in the House of Commons, very few people avail themselves of it," most members liking to get a breath of fresher air than that of the House of Commons, and the diner-out being still a power in London, Mr. O'Connor confesses that though "the House of Commons is a very sober assembly, there are not always wanting indications of the enjoyment of the evening meal and its accompaniments."

To "question-time"—an institution of which he strongly approves—"there is nothing in an American legislature to correspond," members of the American being excluded from both Houses of Congress. "There is nothing which gives a more perfect idea of the vast extent and the strangely heterogeneous composition of the British dominion and British gov-

ernment than the questions that stand daily on the order paper. They sometimes run up to nearly a hundred, and they occupy one or two hours in being asked and answered. . . . It is a period of surprise, excitement, laughter, rage. . . . All other times are tame and eventless in comparison.

"There is an idea among those unacquainted with the House of Commons, and acquainted with the general sombreness and reserve of the English character, that the House of Commons is an extremely quiet and decorous assembly. The very reverse is the case. It is boisterous, noisy and as responsive as an Æolian harp to every passing mood."

"THAT LITTLE WORD HEAR, HEAR."

Mr. O'Connor confesses that meetings in England and Scotland, consisting in the majority of Englishmen or Scotchmen, are "much more enthusiastic" than his Irish-American audiences. "Indeed, it is only after considerable experience that the speaker from Europe gets accustomed to the coldness of American audiences. At first it is most depressing and disheartening. There are many reasons for this feeling, but I believe one of the chief of them is the absence of that little word 'Hear, hear!'" . . .

"'Hear, hear!' is the one form of expressing emotion which the House of Commons knows."

WHO WOULD BE A WHIP?

Of the whips Mr. O'Connor has much to say that is gratifying to British self-esteem. "To Americans, with whom interest in politics is largely circumscribed, nothing can be much more astonishing than the class of men who are willing to perform certain political duties in England. Of all occupations, one would suppose that of whip would be the very last which would be coveted by any man in the possession of his senses, and not driven to the acceptance of a hard lot by the eternal want of pence. For here are some of the duties of senior whip: He has to read all the newspapers every morning, and give an idea of their contents to the leader of the House of Commons. This means that he must rise pretty early. He has then to see the wire pullers, and have a consultation about the selection of a candidate for a constituency. It may be that he has to settle one of those nasty little disputes which arise even in the best-regulated parties. He has to attend to the demand of his party for speakers to assist at some open-air or indoor demonstration. . . . He has not only to be present when the House meets; he has also to remain there until the very last division has been taken, and finally he has to move that the House adjourn."

Yet "this office, with all its anxieties, is eagerly sought by all kinds of people." Lord Richard Grosvenor, whose high rank and wealth is dwelt upon by Mr. O'Connor, was whip in the specially trying years 1880-1885. Mr. O'Connor does not think that he "could give a better illustration of the difference between the way in which the rich in England and in America look upon political life and political office."

IS ENGLAND TO LOSE COMMAND OF THE SEA?

LORD GEORGE HAMILTON contributes to the *National Review* a dispassionate and statesman-like paper on the question: "Is England's Sea-Power to be Maintained?" In discussing this he carefully abstains from partisan recriminations or alarmist rhetoric. He quotes Mr. Gladstone's "perfect" satisfaction at "the adequacy and capacity" of the British Navy, and then proceeds to give a plain statement of the facts: "The purposes for which the British Navy exists are the protection of the colonies, commerce and territories of the British Empire, against the united naval forces of the two strongest existing foreign fleets, by maintaining against such a combination the command of the sea. . . . France and Russia happened to be then, and are still, those two powers, and, therefore, their fleets, present and prospective, form the test."

Lord Hamilton reasons that since other nations have few distant coaling stations and their battleships have inferior coaling capacity, the great naval struggle, if it came at all, would most probably occur in European waters. Hence comparison between the British and the allied navies must leave out of count "all British foreign squadrons abroad (except the Mediterranean) as being too remote from the central conflict, and as being mainly composed as second-class cruisers and small vessels, whose functions are not to fight battleships, but to protect commerce."

BEFORE AND AFTER THE NAVAL DEFENSE ACT.

Lord Hamilton then proceeds to make tabulated comparison at three periods. "In March 1889, before the Naval Defense Act was introduced, . . . we had of effective battleships 32, of 262,340 tonnage, against 23 French and Russian ships of 150,653 tonnage, but . . . many of our ships were old. In April 1894, at the end of the Naval Defense act, . . . the five years' work ending in 1894 . . . shows in battleships alone an addition of 14 ships, 179,300 tons to the British fleet, against 13 ships, 120,300 tons to the fleets of France and Russia . . . Our ships are more modern and have relatively a greater concentration of offensive and defensive power than the ships added to the other navies."

These figures do not include "England's present effective armored and first-class cruisers," which number 29 against a Franco-Russian total of 17.

Thus, as the case of the three greatest naval powers of Europe now stands, "although England may fairly claim to be equal in strength to her two most formidable competitors, no one can pretend that the margin of her superiority is such that she can afford to rest on her oars."

FRANCE AND RUSSIA BUILDING FIVE TIMES AS MUCH AS ENGLAND IS.

Comparing next "the prospective building programme of the three countries on January 1, 1894, as now known. France and Russia will have on January 1, 1894, no less than 23 large ships, with an aggregate tonnage of 210,300 tons, in various stages of construc-

tion, against only four of Great Britain, with an aggregate tonnage of 56,000. But at the time I am writing, on three out of the four . . . no actual work has yet begun."

"These figures," says Lord Hamilton, "indicate an urgent danger ahead."

The Law of Sea Power.

The agitation for a strengthened British navy naturally finds reflection in the magazines. "Nauticus," who writes from the point of view of "a naval expert of neutral nationality," and of "a publicist who finds in the *Indépendance Belge* a tribune," expounds in the *Fortnightly* the laws of "Sea-Power; Its Past and Future." He calls attention to the great discovery published three years ago, by Captain Mahan, of the United States Navy. This was a discovery of the simple fact that sea-power, whether local or universal, cannot be enjoyed by more than one tenant in any given district, and of the law that "sea-power, or mastery of any sea, in proportion as it is complete, confers upon its possessor an ultimately dominating position with regard to all the countries the coasts of which border that sea." This law is verified in the great wars of history in which navies took part. Captain Mahan's demonstration of it has "roused the dockyards of Europe and America to unwonted activity."

GERMANY, NOT FRANCE, ENGLAND'S RIVAL.

Many maritime powers forget, however, that "sea-power does not rest primarily upon the possession of a strong navy, but upon the possession and the maintenance of a superior maritime trade. A navy does not make trade. . . . Spain had at one time the best trade of the two hemispheres. When she lost her naval supremacy she also lost her trade. The Netherlands inherited Spain's business, but preserved it only so long as the Netherlands navy was equal to the task of its guardianship. . . .

"If, to imagine an illustration, a naval war were to break out between France and Great Britain, and if the latter were to experience a decisive and crushing defeat at sea, she would lose her trade. But, in the existing circumstances, it would certainly not pass under the control of France. There is no doubt whatever that Germany, which is already the second commercial power, would immediately become the first." . . .

Unfortunately France remains "blind to the fact that the vacated place would be occupied by Germany. She persists in believing that she could take it. And this is because she will not accept Captain Mahan's law of sea-power."

WHAT EUROPE HAS A RIGHT TO DEMAND.

"Great Britain pretends to the supremacy of the sea, and Europe is, upon the whole, resigned to her enjoyment of it. But . . . Europe has a right to demand that so long as Great Britain continues to put forward her claims, she shall support them so determinedly and with such a convincing display of her ability to maintain them as to accustom her en-

vious neighbors to the idea that in a quarrel with her they are foredoomed to defeat. Upon no other terms is her presence in the Mediterranean either tolerable or defensible. . . . Her sea-power has ceased to be convincing, undoubted, recognized; to-morrow it could be shattered, perhaps immediately, by France alone, if only France had no other preoccupations and if she were assured beforehand of Italy's non-interference. For the citadel of British sea-power, the vantage-point upon which rests the centre of the British position in Europe is in the Mediterranean; and, excluded from the Mediterranean, the United Kingdom would in a few years be no weightier a factor in international politics than the Netherlands or Denmark."

"Nauticus" shows by comparative tables British naval inferiority to France in the Mediterranean, and concludes that England's "present policy of pretension and powerlessness in the Mediterranean is perhaps the most formidable of existing menaces to the peace of the world."

IS RHETORIC WRECKING IRELAND?

THE *Fortnightly* reviewer who signs himself "X" gives us this month his second pessimistic picture of "the Ireland of to-day." He entitles it "The Rhetoricians of Ireland." It is drawn with caustic vigor. "There is," he says, "common-sense in Ireland, but it almost never gets a chance." It is mostly checked and choked by that "disastrous specialty—the visitation of oratory."

"The rhetoricians of Ireland eat one another up at such a pace that a decade suffices for a generation. . . . Each succeeding group rises, talks itself into ascendancy, and culminates either in securing office or in being broken by prison and exile, or on the wheel of public disfavor. Sundry general rules are observable, too, in the alternations. A given series of silver-tongued place-hunters will by reaction produce a crop of violent reformers. . . . It is a story of talk, practically nothing but talk."

THE CHANGE UNDER PARNELL.

In this light the chief Irish movements of the last hundred and twenty years are reviewed: "From Flood to Isaac Butt the controlling idea behind every representative Irish voice had been to produce an effect upon England and the English. Sometimes the design was to cozen or seduce, again to awe and terrify. Now the thought was to curry immediate favor, now to create a dazzling impression of wit and eloquence, now to build up that solid sort of repute which suggests a judgeship."

Biggar and Parnell introduced a new era. They imbued their "young bloods" with the "spirit of scorn for English applause and of distrust for English assent." "It is, perhaps, the highest proof of Parnell's power that for six years he was able to keep this big rhetorical force under tolerable control." "The discipline was a rigorous and exacting one."

WHAT UNMUZZLED THE RHETORICIANS.

The result was deeds, not words; the conquest of the English Liberal Alliance and the restoration of belief in Ireland as a nation. But "the fatal trouble was that the new 'union of hearts' and the old contempt for English opinion could not be brought under the same blanket. . . . This release from the tension of discipline unmuzzled the rhetoricians—and in a very short time the Irish Nationalist party had gravitated to pretty much the level of the other Irish parties that had gone before."

Messrs. Dillon and O'Brien are selected as initiators of this "reversion to type." When Parnell fell, and they were in jail, "the practical men," the men of the "latent common sense in the country," "held the national ship off the rocks," and got the Nationalist party into capital fighting trim. With the release of the two prisoners began "the triumph of the rhetoricians within the party organization. There is no member of this majority who has to his credit a single clause of effective legislation. Collectively they have done nothing but talk and write during their dozen years of public life. The old taint of self-seeking has reappeared. There are charges of corruption already in the air, and it will be a matter for surprise if, during the lifetime of the present Parliament, a formal rupture does not take place."

CAMEOS IN EPIGRAM.

Then we are presented with a series of what purport to be photographs in epigram of the Irish leaders. "Exaggeration is said to be an Irish failing; with Mr. O'Brien it is a disease." At first "he impressed his associates as a modest man and a good fellow." Then "he blossomed forth suddenly as the most tremendous egotist of anybody's acquaintance" who is yet sincerely conscious of his own utter unpretentiousness. Mr. Dillon "is a narrow man, self-centred to a remarkable degree, and with an extremely small stock of ideas."

Of Michael Davitt we are told: "Where other men carry written the lessons gained in human contact, and acquired knowledge of their fellows, he has a blank space. He does not get on smoothly with others; he picks his co-workers badly; he gets jealous of the wrong people, and is perpetually looking for figs among the thistle spikes."

"Mr. Edward Blake, who was imported from Canada, will go back again some time at the spontaneous suggestion of an entire Irish party. . . . It was hardly worth while to go so far at this late day for an inferior imitation of Butt."

Mr. T. P. O'Connor's plans and ambitions "do not bear any appreciable relation to Ireland whatever:" "This self-constituted Directory, having gathered into its hands the reins once held in Parnell's vice-like grasp, discloses no disposition to drive anywhere. Its sole discoverable idea is to stop still and make speeches from the box seat."

Nevertheless "X." declares "the defeat of the practical men" to be "more apparent than real."

HOW FRANCE GOT GOOD ROADS.

IN *Paving*, Mr. Arthur Lagron tells "How France Got Good Roads," and his article contains valuable information for the many people interested in the improvement of country roads in the United States. France, as is well known, has one of the best systems of roads in the world. In that country the roads are divided into three classes, the national roads, built and maintained by the government, and the department roads, built and maintained by the departments, and vicinal roads. Besides the villages have a number of small roads or streets leading to their most important points. Most of the national roads were built by the government for general use previous to the railroads, when freight was hauled from city to city by horse power and public hacks were all the luxury a traveler could enjoy. The roads of France are not, it would appear, the result of a slow, progressive process. Mr. Lagron tells us that about fifty years ago France was in as bad a condition as we are at present.

WHAT CAN BE DONE HERE.

Considering the question "How can we do something similar here," Mr. Lagron says: "The most serious objection I have heard against such a question is that the citizens of the United States are too proud to surrender their rights. Each town and township having charge of the roads will not let the State infringe upon their privileges. I do not pretend to dictate to our legislatures what they ought to do, but it is evident from our experience of the past that a power must be created to order and build roads; in other words, there must be a centralization or there will be no unity of action.

"With unity of action we will have uniformity of work. Some localities have good road-making materials; some have not. Some towns will be so situated as to have but a small mileage of roads to build, where others will have more than their share. The centralization will balance the expenses more evenly, and whatever assessments are made, special taxation to property owners should be but a small fraction, county and State paying the rest.

"My opinion is that when the proper authority has decided that a road should be built between two points, passing through one or more other points, a careful survey ought to be made somewhat like for a railroad, looking for the straightest line with the best grade and cheapest location. Of course it would be policy not to injure farms unless for a real benefit to the road. Then when the survey should be approved, a law should be passed to order it built, the right of way secured or condemned, the assessments made upon the State, the counties and the property owners in a certain district through which the road should pass. Then let competent engineers take charge of the construction according to approved specifications.

"By no means should the vigilance of the central power stop here. The question of maintenance is of vital importance and should not be neglected."

THE ITALIANS OF TO-DAY.

As Sketched by a French Artist.

IN recent numbers of the *Revue des Deux Mondes* M. René Bazin has published three interesting articles on "The Italians of To-day." They are very eloquently written; but so many fine descriptions of Rome and the Campagna exist in literature that the practical details of architecture and husbandry contained in its pages are best worth specifying.

ROME.

Rome is in reality quite a small town, and during the last twenty years it has been struggling in the grip of an alien civilization. Its population has nearly doubled since 1870; for it had then 226,000 inhabitants, and now can boast of nearly 400,000. Out of four people walking in a Roman street barely half are Romans. And to house this surplus of strangers the old city has been pierced as by dividing knives, an attempt being made to construct new streets on a regular plan, of which the chief example is the long handsome Via Nazionale, which possesses undeniable beauty, but might just as well be a thoroughfare in Turin or Milan. Baron Haussmann was in Rome when the Italians became masters of the city, and the trace of his transforming hands is still plainly to be seen. The fever of speculation which seized upon the Roman nobles and made them play into the hands of building firms, and the devastating ruin which fell upon the spiders as well as upon the flies, has become matter of history. Old travelers who remember the Rome of their youth wail over the desecration, and say that a unique result of ages has been destroyed for the creation of a handsome town like any other town; that the new houses are blindingly white or unpleasantly yellow, and the pity of it is that innumerable buildings are left unfinished, the openings walled up with boards and sometimes literally inhabited by squatters. In some instances fine frescoes adorn the walls of half-built buildings, but the dire fate of commercial failure fell upon the masters and men, and a washerwoman may be seen carrying her pile of linen up the unfinished stairs. M. Bazin tells us that the army of 50,000 workmen, contractors, artisans and speculators put to flight by the crisis are gone, and there is no sign of their return.

THE CAMPAGNA.

Leaving Rome, which must ever possess the Coliseum and the Vatican, the seven Basilicas, the rushing fountains of the past, and whose new streets must be endured with resignation, M. Bazin bids us take our stand with him on the steps of St. John Lateran and look across the Campagna. The Agro, or vast land surrounding Rome on every side, is full of tormenting questions and the subject of most contradictory statements. Enterprising husbandmen of all ranks try their hands on it, but it is full of fever, and in the old Roman literature we find lamentations over the malaria which might have been written yesterday, and amidst the ruins of ancient suburban houses of the larger sort are votive stones to the great goddess

Fever. What the Popes did, what the Italian government has done or tried to do, and the story of the immense emigration of Italians to foreign countries, notably to South America, leaving this great and almost uncultivated desert at their very gates, is told very powerfully and picturesquely by M. Bazin. While the rural Italians are leaving their native land, the mountaineers of the Abruzzi are being brought down in hordes to work on the great estates. These poor people receive the smallest pay; they are contracted for as if they were all but slaves. M. Bazin's article is full of feelings of picturesque description. Rome enthroned in its Campagna is the most striking and poetical place in the world; but there appears to be a spell upon all attempts to make it a satisfactory home for modern civilization. Crops there are, and herds of cattle, and men and beasts compose endless unsought pictures; but the genius of the people and place seems to refuse assimilation, and the tide of life beats up against those ancient ramparts and is worsted in the struggle.

NAPLES.

M. René Bazin's concluding article on "The Italians of To-day" deals with the South of Italy, and opens with a piteous picture of Naples. The older portions of the town, those inhabited by the poorer part of the population, were always narrow and squalid, and the piercing of new streets has much impaired their condition. As so often happens, the artificial creation of a workman's quarter has not answered; the new flats are taken by the better class of artisans, and the world of small dealers, sellers of fruit, fish and macaroni, and the hand-to-mouth classes driving small trades, or living on beggary, cannot move into a distant quarter of the city without dislocating their precarious industries. When the cholera seizes on the older streets of Naples it carries off a thousand victims daily, and M. Bazin leaves on the mind of the reader an impression that nothing effectual is being done in the way of remedy.

M. Bazin gives a terrible picture of the condition of the Neapolitan poor, who actually see day by day great palace-like houses erected, not so much in the place of, but absolutely above the miserable hovels which represent to them home. In many cases whole families are turned out at a moment's warning when the edifice above them is advancing near completion.

THE DESERTED GARDEN OF EUROPE.

The country districts of South Italy are in an even worse plight, and nothing is left for the peasants to do but emigrate to the South American States; more than eighty thousand men went in one twelve months, yet M. Bazin observes that in Calabria he looked out from the train on more than three hundred kilometres of lonely uncultivated districts. As for the country populations at Reggio, where bergamot scent is distilled, the workmen go to bed at five in the afternoon, rise at ten, and work all the night through, and until three the next afternoon. For these fifteen hours' hard work in the scent factories they are paid the sum of one shilling a day. Their food is naturally

innocent of meat or wine; breakfast being composed of pepper-pods dipped in oil and eaten with black bread.

Whether modern Italy can ever be brought successfully into the ways and methods of the nineteenth century remains to be seen. The transition from the mediæval to the modern world has been too sudden, the country has not developed from within, all so-called improvements having been imported from without, and as yet alien to the genius of the Italian people. As is but natural from his point of view, the author of the article looks forward to a day, when, discarding the Triple Alliance, Italy will awake to a better tradition, and seek both prosperity and safety by entering into amicable relations with France.

MATABELE MANNERS.

TEN years' residence among the Matabeles enable the Rev. D. Carnegie, of Hope Fountain, a London Missionary Society station in their land, to furnish to the *Sunday at Home* a very interesting series of papers on Matabele customs and beliefs. On Lobengula and his government, Mr. Carnegie thus pronounces: "He is their god, who rules by fear, overrides justice, kills the innocent, plunders his peaceful neighbors' cattle; is, in fact, as far as it suits his cunning heathen craftiness, the same sort of a monster as his father was. Round this heathen monarch and his counselors cling tenaciously superstition, witchcraft, and caste, which are other names for what we term the government of the country, which really is no government worthy of the name, but a patched-up combination of heathen laws and customs, of self-conceitedness, pride, and arrogance and ignorance, upheld by fear and terror, guarded by jealousy and revenge, and the frequent sacrifice of human life.

LOBENGULA'S TITLES.

Thus far the missionary. The Matabele lavish on Lo Ben among other laudatory titles these: "The Heavens, The Spearer of the Heavens, Rain-maker, Great Father, Great Mother, Great King, Great Black King, King of Kings, King of Heaven and Earth. . . . At the dance they often call him by the titles of Rain, The Full River, Mighty Gushing Sounding Water, The God of Rain, Rain-maker, and other such high-flowing phrases. . . . Many think that by some strange process or other the sun dies every evening, and a new one is born every morning. This opinion is more general in regard to the moon. They believe that the chief creates the new moon every month, and on their first seeing it they thank the king.

The war dance alluded to takes place every year in January and February: "This is held at Buluwayo, where people from every town in the land congregate, dressed up in all their finery, which includes black and spotted calico, pink and black beads, twisted round their legs, necks and arms; skins—monkey, tiger cat, jennette, buck, sheep; old coats, shirts, hats and patches of rags of every description. It is the

annual gala fair to which they come to thank and praise the chief for sending the rain."

"NO WORK, NO FOOD."

With all their savagery the Matebele are civilized enough to impose the labor test on every rank: "Lazy persons who will not help in sowing or reaping are driven from town to town. No work, no food is the motto for them. The queens themselves dig their gardens, and everybody who can must help to prepare for the dry season."

Unfortunately, industry does not destroy mendicity: "From the queens and head indunas, down to the meanest slave, men and women, and boys and girls, all of them are persistent beggars. . . Their reason for having this begging propensity so largely developed is 'Because,' they say, 'we white people were created in the long ago—long before them, which accounts for us having so many good things and they so few.'"

A RICH LAND.

Mr. Carnegie speaks highly of the resources of the land: "The soil is very well suited for all kinds of European seeds. You may have two crops a year, and good ones too, provided you attend to your land as you ought to do. You need never be without green vegetables all the year round; fruit trees grow luxuriantly, grapes and oranges and bananas flourish abundantly. The land is rich with deep soil, the valleys are well watered, and fountains bubble up everywhere. Irrigation can be made easy; hundreds and thousands of cattle, sheep, and bucks graze here, and many more would but for the primitive mode of rearing live stock. . . No doubt coffee, tea and cocoa would also grow if they were planted; and the settler may reckon on fir, spruce, larch, and other kinds of trees thriving as well."

THE KING'S PALACE.

In a similar article in the *Leisure Hour* Mr. Carnegie gives this picture of the royal residence: "There is a dwelling house of red brick at Buluwayo, with three apartments in it, in which are kept tobacco, mats, skins, picks, corn, beer, calabashes and various other articles. One or two pictures grace the walls, the plaster of which, when I was last there, had partly fallen off, and which can scarcely be discerned on account of dust and cobwebs. Her Majesty the Queen's picture is there among others. Rats and bats, not to mention other live creatures, ants, beetles and such like, abound in every part of the house. The original fire place is discarded, and another one, in the form of an old broken clay pot placed in the middle of the floor, is used instead.

"Outside in the veranda are tusks of ivory, rhinoceros' heads, lions' skins, tigers' skins, a box or two, an old chair and some native-made baskets. Just alongside is another brick building in which are stored clothing, calicoes, beads, shawls, guns, powder and other lumber. A brick wagon house, recently built in place of an old pole one, is on the 'sun up' side of the large building, while at the back, and

partly round this inner yard are the huts of the queens and their slaves. Just hard by the wagon house is the cattle kraal; and beyond it the large open inclosure some thousand yards in diameter, round which are built the huts of the town of Buluwayo."

A PLAGUE OF RABBITS.

IN the December *Lippincott's* Mr. J. A. Ingram gives some startling statistics of the plague which came upon the Australian settlers through their inadvertence in introducing bunny to their far away Eastern continent. Three pairs of rabbits were brought by an enterprising settler and deposited upon the 2,900,000 square miles of Australia. They were naturally for some time regarded as curiosities, but having multiplied exceedingly, to the manifest delight and fatness of the wild dogs and various other carnivora, they finally exceeded the capacity of these predatory animals, and began to be noticed in unpleasant numbers among the gardens of the settlers, who were themselves becoming more and more numerous.

"As the bunnies continued to increase the havoc on the crops became greater and the destruction in orchards and gardens more general. The colonists became frantic with their grievance. They called a public meeting to consider the matter. After much argument, it was decided that either the rabbits or the colonists would have to leave. A crusade was organized against the intruders. Volunteers were enlisted and companies organized. The forces moved in mass on the animals. The rabbits moved in mass elsewhere. Their migration did not improve the condition of adjacent districts, nor advance the welfare of the neighboring settlers. The reception of the rabbits was neither cordial nor pleasant. Hostilities were declared in advance, and extermination began on their arrival.

A GREAT ARMY OF BUNNIES.

"On account of dangerous conditions and hostile surroundings, the rabbits formed resolutions of confederation, and banded themselves into herds for general security and private protection. The herds doubled and quadrupled within a few months. As their moving hosts grew they covered the plains like the locusts of Egypt, and swarmed along the borders like sands on the sea-shore. The great armies of bunnies finally numbered millions and tens of millions. They moved over the settlements in such masses as to devastate the farms, deplete the fields, and lay waste whole districts. The grass on the plains was eaten up and the pasturage destroyed; the track of the devastating hosts was left as barren as a desert. No sprig of grass was seen or blade of herbage left. The cattle were driven away into other provinces, or starved on naked plains. The flocks died or were removed from the pathway of the devouring plague. The grazing interests were no less injured than the agricultural.

"The people found themselves powerless to cope with their raiding adversaries. Their forces were inadequate to the war. The increase of the rabbits

surpassed the powers of computation, and the desolation was widespread.

"The nimble legions passed to and fro over the land like an avalanche of destruction, consuming whatever came before them. The continent became checkered with the tracks of the roving scourge.

"The colonists again assembled themselves. Their condition was desperate, their future most unpromising. The rabbits had possession of the land, and bade fair to take charge of the country. The attempt to exterminate the furry hosts had been like an attempt to sweep back the waves of the ocean. The more the people exterminated, the faster the animals increased. Rabbits reproduce when four months of age. They have eight little ones in a litter. They breed seven times a year, and in a few years the offspring of one pair number millions.

HYDROPHOBIA AS A MEDICINE.

At last the colonial parliament had to take up the cudgels in the settlers' fight with the rabbits and a reward of \$125,000 was offered to any one who would invent a way of relieving the colony of the pests. Thousands of people tried, companies and syndicates being formed to advance means for accomplishing the desirable end. Pasteur finally evolved the original theory that by inoculating certain of the rabbits and introducing hydrophobia into the systems of a few hundred bunnies, they would bite their comrades and their comrades would bite *their* comrades, and so on until madness would take off the whole tribe. The French scientist's experts had actually arrived in Australia with their hypodermic syringes when the Australians suddenly considered that this cure might be worse than the disease, since their dogs would bite the mad rabbits and there would be the pleasant prospect of having the whole continent go mad, so that that scheme was abandoned at the last moment.

HOW THE RABBITS WERE FINALLY EXTERMINATED.

"One hundred million acres of territory were overrun by the animals. Although the raiders killed 2,528,000 rabbits per year, and received a bounty from the government for each of the scalps, the rabbits remained in full force. But the great drought of 1888 excelled Pasteur's remedy and all the guns and canines in Australia. The lakes and watercourses were fenced in by wire screens, and the animals died by millions from thirst. Shutting out the water from the bunnies has been found the most successful weapon in all the arsenal of destruction.

"Wire fences were the final resort of the colonists. It was seen that the only way to protect adjacent districts from invasion was to fence in the territory occupied by the rabbits. A fence, two hundred and seven miles in length, was constructed from Narromine, on the Macquarie River, to Bourke, on the Darling River. It was then continued to Barringun, a distance of eighty-four miles. The cost of the fences was four hundred and ten dollars per mile. Other colonies concluded to follow this example. A fence was constructed along the South Australian border from the river Murray a distance of two hun-

dred miles, and then continued one hundred and forty-four miles to the northwest corner of the colony. Queensland also thought it needed some fences. One was built along the southern line of that colony for two hundred and sixty miles, to connect with the northeast corner of New South Wales. Another fence, three hundred and forty miles in length, was projected in New South Wales from Albury to Tran-zie.

"When these fences effect a connection with the other fences the rabbits will be surrounded, and their extermination can by military supervision be reduced to a system. Fences can be handled instead of troops. Raiders can move on the rabbits with wire in the place of arms. Fences can be used within fences. The screens can be advanced, shifted, and deployed to accomplish strategic ends and to achieve extraordinary slaughters. The wires have been put in training and moved on the animals with the most successful results."

HOW OUR ANCESTORS SPENT THEIR HOLIDAYS

AN instructive and amusing article is that in the *Nouvelle Revue* on the medicinal baths of the Middle Ages, by M. Fernand Engerand. Towns may come and towns may go, as war and commerce decide; but wherever curative springs, hot or cold, start unbidden from the earth, we usually find them frequented, from age to age, by an unending stream of visitors.

THE HEALTH RESORTS OF THE SAVOYARD VALLEY.

The Romans have left traces of their thermal establishments all over France. The great arch in the market place of Aix-les-Bains, and the remains of conduits and baths underneath the flowery gardens of a neighboring villa, testify to the long record of the Savoyard valley; and the early Gauls adopted the habits of the Roman imperial colonists and bathed and feasted in like manner. But when Attila came down with his Huns they wrecked the complicated bathing arrangements, and that generation bathed no more. On the withdrawal of the barbarians into Germany, the natives, however, set to work to restore the conduits, and in 484 we find Prince Ambron, son of Clodion the Hairy, bathing at Plombières and at Luxeuil, where arose a legend of the seventh century, telling how St. Agile restored a dead man drowned in the bath. Aix in Provence was sought by invalids during three centuries, but Charlemagne preferred Aix-la-Chapelle, and fixed there the abode of his later years for the express purpose of enjoying the hot springs; he liked bathing in company, and his courtiers disported with him in the water.

CAUTERETS AND SPA.

Then came the turn of Cauterets in the Pyrenees, and of Spa on the skirt of the Ardennes. We hardly realize that Spa was a popular watering place in the time of William the Conqueror, and that invalids camped out in tents because the little old town was too small to hold them. In the fourteenth century we find an ironmaster buying wood from the Bishop

of Liège and building "Young Spa," near the spring called the Pouhon.

THE MEDIEVAL BATHS OF SWITZERLAND.

But the strangest story of mediæval baths is that told by Pogge, the Florentine Secretary at the Council of Constance in 1415. Not far from Zurich are sulphur springs still enjoying a mild reputation among the serious and decorous Swiss people. They had been discovered, named and used by the Romans, and may now be found in the then *Gazetteer*, under the head of Bade, near Aarnau. They were not of much importance in classic times and are not of much importance now, but in 1415 they were the height of fashion! From a radius of two hundred miles and farther, if the trouble and perils of the journey could be surmounted, came the bathers, not, generally speaking, on account of illness, but because they desired a complete holiday; and according to a long letter written by the Florentine to a friend they seem to have had a merry time indeed. Neither Bath in the last century, nor Nice, Vichy or Royat in the present day, can boast of such carnivalesque diversions. The bathers lunched in the water off floating trays made of cork; their hair was garlanded with flowers, tied up with ribbons. Men, women and children played games and indulged in the wildest gaiety. Pogge, the Florentine, seems to have enjoyed it all very much, but we may well be thankful that times are quieter now.

"THE MEN OF ACADIE" IN ANOTHER LIGHT.

DR. T. BOWMAN STEPHENSON continues in the *Sunday Magazine* his chivalrous endeavor to vindicate the British name from the aspersions cast on it by Longfellow's "Evangeline." He quotes from French authorities to show that when peace was declared between France and England, French priests stirred up savages to massacre Englishmen, and French governors supplied the murderers with arms and ammunition. He tells how a French governor wrote: "In order that the savages may do their part courageously a few *Acadians, dressed and painted in their way*, could join them to strike the English."

"NOT THE SIMPLE PEASANTS OF THE POETIC STORY."

"The Acadians, then," rejoins Dr. Stephenson, "were not the innocent, simple peasants of the poetic story." Abbé le Loutre, Vicar-General of Acadie, "habitually employed the savages whom he had converted (!) to terrorize those Acadians who were disposed to dwell peaceably under English rule, and he was the contriver and patron of innumerable villainies. . . ."

"The English colonists had abundant reason to fear the continued presence within their borders of a population belonging to an alien race under the complete control of a hostile and unscrupulous priesthood; who were not ashamed, at least at times, to assist savages in their murderous raids, and who declined to give, by oath or otherwise, any sufficient assurance of their having accepted in good faith the government

under which they were living in security and freedom.

"Yet many attempts were made to bring them to a better mind; and long forbearance was exercised towards them. They were absolutely free of all taxation. . . ."

On their instantly demanding the return of their weapons, of which their hostile actions had compelled the British authorities to deprive them, they were told that they must take the full oath of allegiance, and that if they refused "effectual measures ought to be taken to remove all such recusants out of the province." Their deputies point blank and twice over refused to take the oath. Deportation was thus the only alternative left to the British Government. "It should also be remembered that this was not the first deportation of Acadians. What the British did, after long years of forbearance and as a measure of self-protection, the French had for years been doing, with all the power of the sword and crosier, as a matter of policy."

THE STORY OF THE DEPORTATION.

"The deportation in 'Evangeline's' country was entrusted to Lieutenant-Colonel Winslow, a colonial officer, descended from the Winslows of "Mayflower" fame. He seems to have been a humane man, to whom his task was very obnoxious, and who strove to do it with as much consideration as was possible. The deportation was of necessity forcible. If no stratagem had been used, the men would have taken to the forests, and there, joined by the savages, would have maintained a fierce guerilla war . . . and the pacification of the province would have been impossible for a generation. The men were therefore summoned to the church to hear a proclamation on a given day. The proclamation told them their fate and the reasons of it. They were detained in custody, but their families were allowed to bring them provisions, and to hold reasonable communication with them. Twenty each day were allowed to go home to settle their affairs, and every effort was made to secure not only that families should not be separated, but even that neighbors should go in the same ship. . . . The whole deportation occupied, not a few hours, as the poem states, but many weeks, and the measure, stern, indeed, even though it was necessary, was carried out with as much consideration as in the nature of the case was possible.

"If this stern and lamentable deed had to be done, it was only done after long forbearance, after plain and repeated warning, and with such care as was possible to prevent needless aggravation of the suffering that was inevitable."

In the *Popular Science Monthly*, Prof. Warren Upham, after reviewing the investigations and estimates of well known scientists such as Lord Kelvin, Darwin, Geikie, Dana, Davis and Wallace, concludes that not over one hundred billion years have ensued since the first crust was formed on what is now known as the earth.

CLIPPING THE LAURELS OF COLUMBUS.

FORESTALLED BY THE NORSEMEN.

Dr. Murray, of the "Challenger" expedition, tells, in the *Scottish Geographical Magazine*, of the Norsemen who discovered and colonized Iceland and Greenland in the ninth century, and went on to forestall Columbus by well nigh half a millennium. "In the year 1000 Leif Erikson and his companions discovered the coasts of Labrador and Newfoundland (Helluland), Nova Scotia (Markland), and New England (Vinland), but the voyages of these bold mariners were wholly unknown to the nations who did not speak the ancient language of the North. . . . The settlements formed by Thorfinn and others early in the eleventh century were soon abandoned, and in 1347 we have the last record of a voyage to America. . . . It is doubtful if Columbus had ever heard of these voyages."

ANTICIPATED BY ANCIENT GREEKS.

The Renaissance, dispelling the geographical night of the Middle Ages, brought to light the ideas of the scientific Greeks. Aristotle had established the sphericity of the earth, and argued that India and the Pillars of Hercules were near to each other. Eratosthenes (third century B.C.) had estimated the circumference of the earth at 25,000 geographical miles. The Italian poet, Pulci, published in 1481 a poem in which he predicted "the discovery of a new hemisphere and the circumnavigation of the globe:"

his bark
The daring mariner shall urge far o'er
The western wave, a smooth and level plain,
Albeit the earth is fashioned like a wheel. . . .
Hercules might blush to learn how far
Beyond the limits he had vainly set
The dullest seaboat soon shall wing her way.
Men shall descry another hemisphere,
Since to one common centre all things tend.

Such was the intellectual atmosphere in which Columbus formed his great enterprise.

ECLIPSED BY MAGELLAN.

The palm of "the most extraordinary voyage on record," Dr. Murray awards to Magellan, when for ninety-nine days he ploughed the waters of the Pacific—a voyage "far surpassing the exploit of Columbus in the Atlantic, both in boldness and in the effect it produced on geographical conceptions. Though he died at the Philippines, and though only one of his vessels ultimately reached Spain, Magellan had finally solved the problem of western navigation, the sphericity of the earth, and the existence of the antipodes. . . . Fifty-seven years elapsed before Drake accomplished the second circumnavigation of the globe."

The whole review of geographical progress leading up to and beyond Columbus is masterly and replete with valuable information. The appended "maps of the world, according to early geographers," constitute in themselves a liberal education in the evolution of geography.

THE BEGINNING OF MAN.

"THE Beginning of Man and the Age of the Race" is the subject of an article in the *Forum*, by Dr. Daniel G. Brinton, one of the foremost anthropologists of the time. The very earliest deposit in which there may be said to be a general agreement that man's remains are found is that called the "Drift," a series of gravel beds in the valley of the Thames in England, Somme in France, and the Manzanares in Spain, and elsewhere in western Europe. In these beds his stone tools and weapons are found lying in undisturbed relations with bones of animals long since extinct, and which under the present conditions of the climate could not exist in that locality, these animals belonging to a tropical or sub-tropical fauna. From this one is led to believe that man lived there at an early date when the climate was much warmer than now, and that he had lived there for a long time, for thousands of his implements have been found in various strata and scattered over a wide area.

WHEN MAN FIRST APPEARED.

After this warm period, a period of extreme cold descended from the north over central and western Europe. Huge glaciers covered Scotland, Scandinavia and Switzerland, and the forests of France were the haunts of Arctic quadrupeds and birds, of musk-ox, reindeer and the white fox. Man, however, weathered this cold period and continued to roam the woods and fish the streams, transferring his habitations to natural caves, where evidence of his hunts and his battles are still to be found. This period of cold is what is called the "glacial period" and by some of our most learned geologists the length of this "icy age" has been placed from twenty to thirty thousand years. Adding this to the former calculation, and allowing a reasonable time for primeval man to develop and spread over the area in which he lived, we have as the approximate time since man has appeared in Europe—where, up to date, we have found the earliest trace of his existence—about fifty thousand years. This Mr. Brinton regards as the minimum allowance for him. Some writers of eminence have required two hundred thousand years to explain all these changes in climate, in organic life, and in geological deposition, but Mr. Brinton points out that the tendency of late years has been toward a reduction of these figures, especially by field geologists, who seem to be more impressed with the rapidity of natural actions than heretofore.

THEORIES OF MAN'S ORIGIN.

Coming next to the consideration of the origin of man, Dr. Brinton declares that "there is no trace anywhere of the missing link. No evidence that man developed out of some lower animal by long series of slow changes." Nor does he accept the doctrine of specific creation as a scientific explanation. There is a third possible theory of the origin of man which Dr. Brinton holds is as good as another, namely, that called "evolution per saltum," or with a jump. "It

is that process, whatever it may be, which produces 'sports' in plants and 'cranks' and 'geniuses' in respectable families. No doctrine of 'heredity' or 'atavism' or 'reversion' can explain these prodigies or monsters, as they happen to be. A family of we know not which of the higher mammals, perhaps the great tree ape which then lived in the warm regions of Central France, may have produced a few 'sports,' widely different physically and mentally from their parents, and these 'sports' were the ancestors of mankind. This is a theory which asks for its acceptance no blind faith in the dogmatic assertions either of science or religious tradition."

WHERE MAN FIRST APPEARED.

As to where man first appeared, Dr. Brinton says: "In fact, we are limited by a series of exclusions to the southern slope of that great mountain chain which begins in Western Europe and Africa with the Atlas Mountains, the Cantabrian Alps and the Pyrenees and continues to the Himalayas and their eastern extensions in Farther India. Somewhere along this line in Southern Asia, or in Southern Europe, or in Northern Africa, we may confidently say man first opened his eyes upon the world about him. Up to the present time his earliest vestiges have been exhumed in the extreme west of this region, but that may be because there search has been more diligently made, but the fact remains that speaking from present knowledge we know of man nowhere earlier than in England, France and the Iberian peninsula."

ARE ATOMS ALIVE?

WRITING "On the Nature of Electricity" in *Merry England* for November, Rev. J. A. Dewe argues that "there is in every material atom a principle of motion," that life is such a principle, and that "the more science advances, the more it discovers that life is bound up with the most elementary forms of matter. . . . Numerous discoveries, moreover, uphold the theory that all material nature is thus animated; the tartar upon our teeth, the corpuscles in our blood, the liquids contained in plants and vegetables, are all living."

Electricity, magnetism, terrestrial attraction, Mr. Dewe holds to be "merely one and the same power acting with different forms and kinds of intensity. That power is generated by the action and reaction of material atoms one upon the other. It increases in intensity according as the superficies of the atoms are so placed that their centres can enter into the closest proximity, thus producing the three different grades of ordinary attraction, magnetism and electricity. The reason why the centres of the atoms—or, to speak more correctly, the atoms themselves—are thus spontaneously drawn toward each other is to be found in the fact, which is being daily proved to be more and more universal, that each atom is animated by a principle of life and feeling. This alone in the whole range of nature is found to be a spontaneous cause of motion. . . . A rudimentary life there must be attached to every atom,

however small; from the highest to the lowest organism there is present life, which, indeed, gradually diminishes so as to become imperceptible in its manifestations, but never does it become altogether extinct."

THE MUSIC OF RUSSIA.

The Late Peter Tschaikowsky.

"THE music of Russia" has been a favorite subject during the last few months. First, there were the papers on the music of various nations read at the congress at the Chicago exhibition, and reprinted in a number of magazines; later M. Albert Soubies published a "History of Russian Music:" and now the death of M. Tschaikowsky again draws attention to the subject. Several magazines contain

THE LATE M. TSCHAIKOWSKY.

articles on the late Russian composer, the most interesting perhaps being that on his lyrical drama, "Eugene Onegin," in the November number of the *New Quarterly Musical Review*.

RUBINSTEIN AND TSCHAIKOWSKY.

"Russian music (says the reviewer) is evidently on the ascendant, for the names of Rubinstein and Tschaikowsky are growing as familiar to our ears as those of Brahms, Dvorák and Gounod, not to speak of the host of new Russian composers, of whom our musical journals are constantly informing us. Both Rubinstein and Tschaikowsky, however, stand out far and away in advance of their native contemporaries, and on the Continent take rank among the greatest living composers.

"The works of the former are, to a certain extent, cast in the classic mold, and are characterized by rugged grandeur, bold conception and breadth of melody; while Tschaikowsky shows a stronger leaning toward the modern romantic school, relying for effect chiefly upon charm of melody, strongly marked rhythms, and the rich coloring of harmony with which his ideas are generally invested; his works, in fact, exhibit finesse in contrast to Rubinstein's force. Distinct as are the styles of these two masters, a

strong national element is visible in their compositions, tending to produce picturesque impressions on the mind."

JURISPRUDENCE AND MUSIC.

Peter Il'titsch Tschai-kowsky was born in 1840, and was the son of a mining engineer. From his association with the peasantry the child early imbibed a strong love for music, particularly taking to the folk songs and antique church music; but his father intended him to study the law, and it was not till he was twenty-one that the youth entered himself as a student at the new Conservatoire at St. Petersburg. Among his teachers were Professor Zarembo and Anton Rubinstein, and when he left the Conservatoire in 1865 he took, besides his diploma as a musician, a prize medal for a cantata on Schiller's "Ode to Joy."

Proceeding next to Germany, he became an ardent advocate of the works and ideas of Schumann. In 1866 he accepted a professorship at the Moscow Conservatoire, and remained there till 1878. After this he seems to have devoted himself almost exclusively to the work of composition. It was in the spring of 1888 that he made his first appearance in London to conduct the performance of two of his works at a concert of the Philharmonic Society. Since then his works have frequently been heard in our concert rooms, and the composer himself has come over to conduct several of them. Only this last summer, when the musical society of Cambridge was celebrating its jubilee, Tschai-kowsky was among the five foreign composers upon whom the degree of Mus. Doc., *honoris causa*, was bestowed. The Czar, who was a warm admirer of his work, granted him some years ago an annual pension of three thousand roubles, and now he has issued an order that three of the dead composer's latest operas shall be given in the native language at the St. Petersburg Imperial Opera House during the present winter season.

"EUGENE ONEGIN."

"Eugene Onegin" was written over ten years ago, but was introduced into this country only in 1892. The text, which deals exclusively with Russian domestic and social life, was furnished by the celebrated Russian novelist, Pushkin. But the libretto is nevertheless a clumsy affair, and it is only by the continuous flow and wealth of melody, the judicious use of harmonies, and, above all, the exquisite workmanship visible on every page of the score, that the composer has succeeded in elevating the music far above the level of the libretto. Musically, the opera is a triumph.

"Originality of ideas and the methods of their developments (says the writer in conclusion) are not the common property of every musician, but with Tschai-kowsky all seems to come naturally. Russia has evident reason to be proud of her Rubinstein and Tschai-kowsky, considering how much they have, by their individual efforts, raised the musical art of their country to a pitch of excellence and prestige in the eyes of all Europe."

THE COMPOSER OF "THE BETTER LAND."

Mr. F. H. Cowen.

IMAGINE Mr. Cowen having to go all the way to Milan to get his new opera produced! And the English a musical nation! The story of "Signa's" misfortunes has been keeping Mr. Cowen's name well to the fore of late, however, and *Sylvia's Journal* for December seizes the opportunity to present its readers with an interesting sketch of the composer by Flora Klickmann, happily not hidden away under the general heading "Musical Notes."

HIS TEACHERS.

Born in Jamaica, on January 29, 1852, Frederic H. Cowen composed his first "work," "The Minna Waltz," in 1858. Two years later this was followed by "Garibaldi," an operetta; and as a souvenir of its first performance Mr. Cowen still cherishes a cup presented to him on the occasion by Mr. Henry Russell. At the age of eight he had Julius Benedict to teach

MR. F. H. COWEN.

him the piano, and John Goss to teach him harmony. Later Mr. Goss taught him the organ, and Mr. Carrodus the violin. In 1865 he entered the Conservatoire at Leipsic, and had as his masters Moscheles, Hauptmann and Reinecke. In 1867 he proceeded to Berlin, but the following year returned to London, and henceforth gave himself up to the life of a composer.

WORKS.

Mr. Cowen's first symphony was composed in 1869, and "The Rose Maiden," one of his most popular cantatas, was produced a year later, when he was only eighteen. A universal favorite is "The Language of Flowers," an orchestral suite. In 1888 Mr. Cowen was summoned to Melbourne to conduct the concerts and undertake the musical arrangements generally for the exhibition. He was *fêted* everywhere, and his visit will be long remembered in the Antipodes. After his return to England he composed the cantata "St. John's Eve" and the opera "Thorgim." His new works, about which we have been hearing so much of late, are "The Water Lily," a

romantic legend, produced at the Norwich Festival, and "Signa," the opera brought out at the Dal Verme Theatre in Milan.

THE COMPOSER AT HOME.

Alluding to Mr. Cowen as a conductor, Miss Klickmann writes: "Calm and concise in every movement, nothing but his face reveals the fact that his whole being is on the alert and strung to the highest possible tension. His memory is apparently inexhaustible.

"At home (Miss Klickmann continues) he looks many years younger than he does on a platform. Of medium height and slightly built, one can readily credit the many stories that are told of his wild mountaineering exploits. A very firm will, and a fixed determination to have his own way, are among the open secrets written on his face.

"In the study, books are on the walls and in every nook and corner. Intellectual, refined, they cover a tremendous range of reading; the humorous element is also well represented. His most engrossing hobby is the pursuit of first editions, and he certainly has a magnificent collection, representing most of our great authors. In many instances he possesses complete sets of their works."

The article is illustrated with portraits of Mr. Cowen at various ages, and a few pictures of his house.

THE WANDERER'S EVENING SONG.

"**V**ELHAGEN" has an article on the Community of Gabelbach, by Herr A. Trinius. Though it is vain to search in atlases and State handbooks for any reference to Gabelbach, the spot has a fame which many another community must envy. In innumerable songs and pictures it has been celebrated; in occasional verses its fame has resounded; and its first poet was one of the most popular with the German people—Viktor von Scheffel.

THE GOETHE-HOUSE ON THE KICKELHAHN.

The wooden house in which the community holds its meetings stands in the midst of fine, proud pine trees, and we cannot visit it without being touched by the charm of German poetry and the silent thought of him who, with his being and his songs, has endeared to us every foot of the ground—Goethe. Gabelbach is indeed founded on classic soil, for Ilmenau, Gabelbach and Kickelhahn are all closely associated with the name of Goethe. He often took refuge here, especially when his feelings and his thoughts were centered in Frau von Stein. He lodged in a tower-like house of wood, two stories high, on the top of the Kickelhahn. In 1870 this building was burnt down, but four years later a faithful reproduction of it was substituted. It was in this curious house that Goethe wrote many of his poems, and from this high place that he addressed his effusions to his beloved, assuring her of his love, and depicted the beautiful scenery of the neighborhood.

"UEBER ALLEN GIPFELN."

The retreat on the Kickelhahn has another special interest. It was in this house, on September 7, 1783, that Goethe wrote the charming little "Wanderer's

Evening Song," beginning "Ueber allen Gipfeln." The words were traced in pencil on the wooden wall of his room, and thirty years later, while on another visit to the place, he retraced the writing, which had meanwhile grown pale and indistinct, and confirmed what he had done by adding "Ren. 29 Aug. 1813." The eve of his last birthday found him once more in his lofty retreat, and when he was looking out into the evening glow, his eye again fell on the words of his song. Now he was deeply moved, the tears rolled down his cheeks, and his lips whispered softly, "Ja, warte nur, bald ruhest du auch!" ("Yes, wait a little, and you too will be at rest!")

AND THE TRANSLATION.

Just four years ago the question of an English translation of the lyric cropped up, and many were the attempts made to give an adequate rendering of it. The late Mr. J. A. Symonds, *e.g.*, "saw that its unapproachable literary excellence depended upon its divine spontaneity in the peculiar, instinctive tact with which Goethe had transmitted a certain felicitous mood of emotion into the simplest language, the most wayward rhythms, the most natural rhymes; all governed by a predominant sense of music, compelling the seeming artless verse to take the inevitable form which belongs to some product of nature—shall I say a frost crystal spread across a window-pane which has been breathed upon—or a film deposited on glass by musical tone acting on a fluid?" Mr. Symonds made three versions, all of which he regarded as failures. Longfellow, Miss Constance Naden, Sir Theodore Martin, Rev. Stopford A. Brooke, and many more, have tried their hands at it; yet the lines still seem untranslatable.

CAN MUSIC DESCRIBE SCENERY?

HOW far music is capable of suggesting scenes which the composer may wish to represent, or of assisting the imagination to realize scenes which may be described by words, is the interesting question discussed by "W. H. T." in *Macmillan's*. The writer is disposed to answer in the negative. "It appears that there is a similitude between the effects of sight and of sound, but it would seem probable that, as the bodily organs of the two senses are distinct, so there are corresponding mental and spiritual faculties appropriated to each which cannot be affected by the other."

He is prepared to grant "that a conventional language could be invented, or might grow up by degrees, by means of which a great variety of ideas might be described by music;" but he is concerned with "the present state of the art." "For my own part," he says, "I do not think that the mind is capable of enjoying to the full simultaneously the beauties of sight and those of sound. . . . In contemplating such a scene as that of the Jungfrau the entire attention is absorbed, and one could not while fully taking in its loveliness, at the same time fully appreciate the finest music; and in the same way, when listening to perfect music, one's faculties are too much occupied to be capable of at the same time fully appreciating such a scene of beauty."

The inquiry ends with advice to the musician to satisfy himself with the limits naturally marked out for his art: "Surely the most ambitious musician has scope wide enough to exercise the fullest powers of his genius and his imagination. Let him be content to leave to the painter and the poet the description of sunny lands and starlit skies, of placid lake and rugged mountain, of peaceful meadow and stormy ocean. The attempt to depict such scenes by musical sounds must fail in the present state of his art, and can only be successful in the future at the cost of genuine musical expression."

These generalizations of "W. H. T." seem to overlook differences in temperament. There are some men to whom the best music is also the mental vision of nature in its various guises. A nocturne of Chopin's affects them almost as precisely as does one of Wordsworth's "Evening Voluntaries."

THE BERLIOZ CYCLE.

A PROPHET is still without honor in his own country. An eminent musician like Mr. Cowen has had to go all the way to Milan to get his new opera, "Signa," produced; and Berlioz, one of the greatest musical glories of France, seems to have found his Bayreuth in Germany! Early in November, Herr Mottl, to whom indeed is due the chief credit for the undertaking, gave a performance in chronological order of Berlioz's operas at Carlsruhe, and to Carlsruhe the pious French have made their pilgrimages in order to be present at the performances of the German versions of their composer's dramatic works, "Benvenuto Cellini," "Béatrice et Bénédict," and "Les Troyens," besides a miscellaneous concert devoted to Berlioz. The *Revue Bleue* of November 18 and other magazines publish articles on this subject. "Les Troyens" has had to wait thirty years for anything like adequate performance, "Béatrice et Bénédict" was first heard at Baden-Baden in 1862, and "Benvenuto Cellini," though well known in Germany, has not been heard in France since 1838.

Very appropriately the November number of *Music* includes a translation of an article by M. Camille Saint-Saëns on Hector Berlioz. He describes his countryman as a paradox made into a man, and says that if there is one quality we must concede to his works, it is the prodigious coloring of the instrumentation.

THE very pressing problem of the teaching of ethics in schools is treated by Mr. John Dewey in the *Educational Review* for November. He strongly protests against the assumption "that if you can only teach a child moral rules and distinctions enough, you have somehow furthered his moral being. . . . The inculcation of moral rules is no more likely to make character than is that of astronomical formulæ. . . . In any right study of ethics the pupil is not studying hard and fixed rules for conduct; he is studying the ways in which men are bound together in the complex relations of their interactions."

JONAS LIE.

THE November number of *Samtiden* is, from cover to cover, devoted to Jonas Lie, and, besides being a graceful tribute to the genius of the great writer, is a welcome and valuable contribution to the magazine literature of the day, giving as it does a perfect portrait of the man who, with Björnson and Ibsen, forms for all time an Orion's belt in Norway's literary firmament. The first study of Lie—for there are several—is given by the eminent writer Herman Bang. In character and person he is Ibsen's Dr. Stockmann—as large of heart, as genial of thought, as broad minded, as blind. Whoever knows Stockmann knows Jonas Lie. And, save for its mistress, the house of Lie is as the house of Stockmann, too.

By request of the editor of *Samtiden*, Jonas Lie himself gives in the same number the portrait of his helpmate, and an intensely interesting portrayal of her exquisitely womanly character and intellectual gifts. They are of the same age, were betrothed at nineteen, married at six-and-twenty, and have lived for three-and-thirty years an ideal life of love and sympathy together. Like John Stuart Mill, he ascribes all that is best in his writings to his wife: "With the exception of 'Nordfjordhesten,' 'Slagter-Tobias,' and a few Adventures, I do not know the book in which she has not been my trusted guide as regards style and, so to speak, my fellow-worker through every chapter, erasing all extravagance, desiring this or that to be written and, under necessity, even writing it herself. It has passed through her sieve; from an artistic point of view my creative powers were undeveloped, and I depended rather on mere chance than on keen and certain sight. That my sea-novels received solid shape is owing to her more intense and developed artist-feeling and clearer artist-eye. The plot of 'The Pilot and his Wife' I had from her. . . . She might well have had her name on the title-pages of my books as my collaborateur. It was, however, not a thing for a 'Frue' of our times to take her rightful place in publicity—her unswerving taste was to content herself with her own consciousness that she was her husband's spiritual equal. . . . But, now that we are entering on our sixtieth year, it seems to me it is time I told that, in all that is finest and best I have written, she has her part."

HOW "KVAERN-KALLEN" CAME TO BE WRITTEN

Among the many vividly interesting articles in this Lie-number is one by Erik Lie, telling how his father came to write "Kvaern-kallen." It was in the month of November. They had just arrived at Rome, and had housed themselves at 52, Via di Capo le Case. Gray, dirty, sleet-weather, cheating and vexations of all sorts had combined to render the first impression particularly disappointing. "Inside the house," says Lie, "we were plagued by fleas—not such little miserable country fleas as we know here in Norway—no, great, fat, shining beasts of prey that grunted like little pigs when one dragged them by the ears to the

washbasin. And not one or two or ten, but regiments. More than once while writing I heard a little pat on my paper, and, looking up, beheld sitting staring at me, believe me, just such a monstrous horrid blood-sucker! Outside in the streets a swarm of jeering, importunate beggars pursued one with prayers and threats alternately, like regular creditors; yes, and the dissatisfied drivers followed one, street up and street down, till one was tempted to appeal to the police. But, worse than fleas and beggars and drivers, was an old witch of a servant, named Lovisa Sorentina. She was a genuine Roman hag, with one solitary fang in her gums, and hands like claws. She was lazy beyond all measure, and so slow in everything that we had at last to have our boots cleaned by a street shoeblack."

To cut the story short, and forego the temptation to give the whole of it in Erik Lie's own fascinatingly vivid style, this charming old lady, who was a pitiless thief and a confirmed drunkard into the bargain, one lucky day fell downstairs and disabled herself, and the overjoyed Lies instantly seized the opportunity to get rid of her. But the old witch got life in her then, and, on hearing that she was discharged, flew up at them like a fury, and hurled a Niagara of round fat curses over their heads. She stormed and thundered, not in ordinary fashion, but in majestic Italian, with eyes agleam and her claws in such swift motion that her fierce gesticulations could only be rivaled by the flood of abuse and menace that gushed and foamed and hissed from her lips. She was magnificent in her rage. Her attitude, her gestures were splendid as those of some glorious tragedy-queen; and, long after the door had been locked upon her, her guttural lashing invective rose from the stairway like some awful decree of damnation. Jonas Lie was deeply and almost morbidly impressed.

It was a night some time later that he was roused from sleep by a strange, horrible song. He rose and looked out of the window. It was two o'clock, and the wineshop over the way had long been closed. But, in the middle of the dark, deserted street stood a solitary being with a turned-down felt hat and a pair of long arms fiercely gesticulating up at the sky. And this being was singing in a rusty giant voice, raw with wine—was "screaming his heart's blood into his mouth," wildly and more wildly yet, horribly, terribly, and more and more satanically in the still night. Jonas Lie listened with all his senses, fascinated; there was a gigantic majesty over the man. He was almost on the point of waking his wife, but refrained. The lamps in the street had been extinguished—no soul was about save this creature, whose wild song bellowed forth hate. He had been sent by that old witch of a servant to confirm her curses, and Jonas Lie was to be put to death, pierced, tormented, burnt—hau, hau, hau!—scourged, broken limb from limb; his people cursed to the ten thousandth generation, and evil given for good through all eternity; he was to be flayed alive and, in the biggest kettle of hell fire, boiled in burning oil—hau! hau! hau!—the kettle boils! the kettle boils! the kettle boils! Jonas

Lie paled where he stood. It might be a forewarning of death, this! Ten minutes more of blood curdling curses, and then the mystic being vanished like a shadow round the corner, and peace reigned once more. The morrow came, and the next, and yet another, and Jonas Lie lived on. The days flew by in merriment—now an evening spent with Arne Garborg, now an evening with the artist Ross, and so on. "Winter passed as through a sieve, and our nine months' stay in Rome was marked only by stronger and stronger flea bites!" But on the night before their departure, lo! the peaceful slumber of Jonas Lie was once more broken by the weird song of curses, and there in the deserted street stood that mystical ally of the witch, with colossal scorn and menace in his throat! But this time triumph mingled with the abuse and threat—triumph that the foreigner was leaving, was leaving the place—going far over the mountains to the people whose blood is green, and whose God is Satan! Branded like a slave, he was fleeing from Italy's sunshine, and the Romans would see him no more before their eyes—would see him no more—would see him no more—ho! ho! ho! ha! ha! ha!

The next morning the Lies left Rome, and traveled homewards, and some two months afterwards there grew out of the witch's curse and other Roman reminiscences the story called "Kvaern-kallen."

THE MOST POPULAR NOVELS.

IN the December *Forum*, Mr. Hamilton W. Mabie takes as a text the statistics which the publishing firm of Messrs. Tait & Sons have collected in regard to the novels most often called for at the public libraries of the United States, and the editor of the *Outlook* analyzes and argues from these data to find out the character and standard of literature which really appeals to our public taste. The results are far more encouraging as to the true instincts of that popular taste than one would think. Among a list of the one hundred and fifty most popular novels, judged on this basis, "David Copperfield" is first, "Ivanhoe" is second and "The Scarlet Letter" third.

Among the first eleven Mr. Mabie finds that eight are novels of the highest literary workmanship and artistic quality, indeed among the greatest in all literature. A further analysis of the statistics shows, by comparing the popularity of different works by the same author, that the public prefers dramatic force and freshness of feeling and touch, among the abstract qualities of literature. Among the whole list of one hundred and seventy-seven Mr. Mabie finds that no less than seventy-six are books of very high or of the highest order of literary quality. He notes a remarkable absence of foreign names, and that neither Tolstoi, Turgenieff, Gogol nor Dostoyevski are found there, and what is much stranger, neither Balzac, Daudet, De Maupassant nor Zola. Of the surprises among the English and American novels, Mr. Mabie considers the greatest surprise that Thomas Hardy, "the most powerful and most artistic writer of the former" is un-

recognized. He attributes this omission of the popular taste to the themes, unproductive of cheerfulness, which Mr. Hardy chooses, and he explains the absence of Mr. Kipling's name on the theory that Mr. Kipling is a writer for men, and that, as Mr. Howells has said, "the readers of books in America are women."

CRUMBS FROM THE "AUTOCRAT'S" TABLE.

REV. H. R. HAWEIS chats very pleasantly in the *Young Man* on his personal acquaintanceship with Dr. Oliver Wendell Holmes. He tells of three-and-a-half hours spent, during his English visit in 1888, in the "Autocrat's" company, along with Bishop Ellicott and Dr. Samuel Smiles: "The talk wandered freely over all sorts of fields—literary and scientific and social—until it got entangled inevitably in "occultism"—ghosts, double psychic phenomena—on all which questions the Bishop keeps a singularly fair and open mind. Talking of brain waves, Oliver Wendell Holmes went off in his best style. 'I think we are all unconsciously conscious of each other's brain waves at times; the fact is, words and even signs are a very poor sort of language compared with the direct telegraphy between souls. The mistake we make is to suppose that the soul is circumscribed and imprisoned by the body. Now the truth is, I believe, I extend a good way outside my body; well, I should say at least three or four feet all round, and so do you, and it is our extensions that meet. Before words pass or we shake hands, our souls have exchanged impressions, and they never lie; not but what looks count for something.'"

PIONEERS OF CULTURE ON THE STUMP.

Having heard Mr. Haweis lecture at Boston, Dr. Holmes gave a glimpse of the infancy of the American institution of lecturing, which sheds interesting light on his younger days: "'You star lecturers,' he added, 'who come over here now and pocket your hundreds and thousands of dollars, little know what we poor fellows, the pioneers of art and letters, in America, had to go through. I assure you, when I began, and Emerson and Theodore Parker, there were places in the States, calling themselves civilized, that did not know what was meant by a lecture. I have arrived at a schoolroom or hall on the night, and found it empty, and we have had to send out and whip up an audience; and so we went up and down the land, trying to get a hearing for poetry, literature, art, science, tramping on foot, too, when we could not get a conveyance. Well I remember arriving at a lone, forsaken place after traveling all day, and at last walking across fields in the mud to get there in time, and finding it was the wrong day. Another time the committee waited on me at the close, the attendance having been uncommonly thin, and asked me to lower my fee. Well, those were good days all the same; we were young then; and then, when you did get your fee, the joy and content of sitting in the sanded parlor of the village or town inn with your feet on the mantel-piece, and rattling the dollars in your trouser pockets, so hardly earned.'"

EMERSON AT LONGFELLOW'S BIER.

A touching story of Emerson in his latest days was told by Dr. Holmes. "After Longfellow died, he was laid in the chapel on a bier, his face was exposed, and numbers of his friends went in to take a last look. Emerson was at that time failing—his memory was almost gone—but as he had been so intimate with us for so many years I thought I would take him into the chapel. As we were both silently contemplating our dead friend, Emerson turned to me and said, 'That is the face of a very amiable gentleman, but I don't know who it is.' This," remarked Holmes, "was very interesting, as well as very touching. It showed that, although his memory was gone, his perceptive and intuitive powers and a certain instinctive judgment of character, all remained unimpaired to the end."

Walt Whitman, on being told this incident, did not think it sad. He said: "Emerson's decline always seemed to me quite harmonious. This slowly sinking back into the arms of Mother Nature when one's work is done—and well done—it is like the decay and slow decrease of fruit-bearing capacity of an old apple tree in a great orchard; at last the old tree crumbles away and sinks naturally into the soil from whence it sprang."

MR. BALFOUR AS CRITIC OF IDEALISM.

MR. A. J. BALFOUR contributes "a criticism of current idealistic theories" to this month's number of *Mind*. He describes the exponents of transcendental idealism as "a metaphysical school, few indeed in numbers, but none the less important in matters speculative." Its central position is that of "a mind (thinking subject) which is the source of relations (categories), and a world which is constituted by relations . . . a mind which is conscious of itself, and a world of which that mind may without metaphor be described as the creator." It claims thus to free us from skepticism, to make reason the essence, cause, origin and goal of the world, and to secure the moral freedom of self-conscious agents.

Mr. Balfour is sorry to object to a theory promising so much: "We may grant without difficulty that the contrasted theory which proposes to reduce the universe to an unrelated chaos of impressions or sensations is quite untenable. But must we not also grant that in all experience there is a refractory element which, though it cannot be presented in isolation, nevertheless refuses wholly to merge its being in a network of relations, necessary as these may be to give it 'significance for us as thinking beings?' If so, whence does this irreducible element arise?"

THE SELF-CONSCIOUS "I."

To Mr. Balfour it "certainly appears" that transcendental idealists are not warranted by their own essential principles in making mind the sole creator of experience. Their analysis of experience leads them to the conclusion "that the world of objects exists and has a meaning only for the self-conscious 'I'."

(subject), and that the self-conscious 'I' only knows itself in contrast and in opposition to the world of objects. Each is necessary to the other; in the absence of the other neither has any significance. How then can we venture to say of one that the other is its product? And if we say it of either, must we not in consistency insist on saying it of both?"

The universe is as much or as little the creator of the self-conscious principle as the self-conscious principle is of the universe. "All, therefore, that the transcendental argument requires or even allows us to accept is a 'manifold' of relations and a bare self-conscious principle of unity, by which that manifold becomes inter-connected in the field of a single experience." Mr. Balfour then proceeds to view the bearing of this result on theology, ethics, and science. The combining principle, which, apart from the multiplicity it combines, is only an empty abstraction, and which is only real in its relation to that multiplicity, cannot be God, who by hypothesis distinguishes Himself from Nature. Just as little can the combining principle, taken together with the multiplicity, be other than non-moral, because it holds in its all-inclusive universality every element, good and bad, of the knowable world. The "unifying principle can as such have no qualities, moral or otherwise." Lovingness and equity belong to the realm of empirical psychology, and Mr. Balfour does not see "how they are to be hitched on to the pure spiritual subject."

THE IDEALISTIC THEORY.

The freedom ascribed by idealists to the self-conscious "I" is metaphysical, not moral; for it belongs only to the subject "in virtue of its being *not* an agent in a world of concrete fact." Mr. Balfour comments on the "difficulty which exists on the idealistic theory in bringing together into any sort of intelligible association the 'I' as supreme principle of unity, and the 'I' of empirical psychology, which has desires and fears, pleasures and pains, faculties and sensibilities; which *was not* a little time since, and which a little time hence will be no more. The 'I' as principle of unity is outside time: it can have, therefore, no history. The 'I' of experience, which learns and forgets, which suffers and which enjoys, unquestionably has a history. What is the relation between the two?"

It will not do to make the latter a phase or mode of the former which is then identified with God or an eternal consciousness: for, argues Mr. Balfour, the idealistic theory pressed to its furthest conclusions, precludes us from supposing that either the eternal consciousness or any other consciousness exists save only our own.

Similarly with regard to science, Mr. Balfour endeavors to make out that the transcendental "solipsism," which is the natural outcome of such speculations, is no more valid or reassuring than the "psychological, or Berkeleyan form of the same creed." He concludes: "I am unable to find in idealism any escape from the difficulties which, in the reign of theology, ethics, and science, empiricism leaves upon our hands."

MR. GOLDWIN SMITH'S VIEWS ON OUR HISTORY.

IN the pages of the *Forum* Mr. Woodrow Wilson gives a searching and pretty severe criticism of the recently published outline of American political history by Mr. Goldwin Smith. Mr. Wilson finds that Mr. Smith's personal view gives a cynical and impracticable quality to his book; that the treatment of the American Revolution gives evidence of the British nationality of the author, and that Mr. Smith's reading of our own historians does not give sufficient weight to the newer and more scholarly canons of historical criticism now obtaining.

THE AMERICAN REVOLUTION.

As to the Englishman's view of our Revolution, in which he saw few elements of greatness and merely the necessary outcome of a relation radically false from the start, Mr. Wilson writes: "The claim to representation, though it may have no legal basis, had a very substantial historical foundation. The American demand was, that the colonists be allowed to act through their representatives, whether in Parliament or in America, as they had always done hitherto, according to a principle lying deeper in the English constitution, as they conceived, than even the privileges of Parliament or the powers of the Crown. If this was in effect a claim to independence, that is why a war for right so suddenly became a war for separation. There had been virtual separation in matters of this kind all along; if it could not remain virtual, it must be made real. That was the revolution; and it is vain to cry 'Woe!' The direful spirit of civil war did all the rest, that was not just, but bitter and shameful. The cause itself was great, if the spirit of English liberty is great; and Mr. Smith differs from the greatest English historians, not only, but also from most informed and liberal Englishmen of our day, in not perceiving that it was really the authentic spirit of English liberty that moved in the Revolution. No other outcome was conceivable, except by us who sit at this cool distance.

Mr. Wilson seriously objects to that view of American history which dwells mainly on "The Expansion of New England," and the clash of Virginian sentiment and principles with those of the Yankee. Our history, says Mr. Wilson, "is far from being a history of origins. It is just the opposite: it is a history of development," and it is in this connection that one is bound to give more attention than Mr. Smith has given to the importance of the Middle States.

THE TYPICAL AMERICAN.

Readers of Mr. Smith's outline will remember that he found a great deal that was approvable in the character of Washington, but looked somewhat askance upon the more rugged and native heroes of our national struggle. Mr. Wilson does not wonder that a search through our history for correct English gentlemen of a modern university and cultured stamp is somewhat disappointing. "We may wish that the typical Americans of the past had had more knowledge a more cultivated appreciation of the value of

what was old and established, a juster view of foreign nations and foreign politics ; that they had been more like Webster and less like Jackson ; and we may hope that the typical American of the future will be wiser and better poised. But in the meantime the past is to be understood and estimated as the facts stand, and only a thoroughly sympathetic comprehension of these men who have actually been the typical Americans will enable us to effect that purpose. The fact that Clay rather than Webster, Jackson and not John Quincy Adams, represented the forces which were really predominant and distinctively American in our development is commentary enough on any theory that makes either of the peculiar sections of the Atlantic seaboard the principal or only theatre of American history. Mr. Smith stares and shudders in Jackson's presence, and looks upon Clay very much as one would regard an uninstructed child."

THE CIVIL WAR.

Mr. Wilson finds that Mr. Smith's view of our Civil War does not take sufficiently into account the constitutional basis of the struggle. "It is a sense for law that has given to the whole development of the nation its cohesion. It is because of this that our great community, while it has spread, has not fallen to pieces. The sentiments of the war time were steeped in legal conceptions. The surviving soldiers of that war would feel with keen shame that they had fought unrighteously if they could not still feel that they had fought for law, not to make a right but to preserve one—not to 'reannex,' but to keep the South. It is this strong conscience and instinct for law, indeed, which has rendered our written constitutions valid and serviceable as sound vehicles of the national life. Those constitutions are not causes, but results—results of inbred character and of a desire for distinct coherence in respect of every step of construction in the development of institutions."

COUNT TAAFFE'S CAREER.

TEMPLE BAR contains a clever sketch of the Austrian statesman, Count Taaffe, whose bill for the establishment of universal suffrage a few weeks ago electrified the world. From the account of the writer it seems that this was but the crowning paradox in a thoroughly paradoxical career. "He is in politics a moderate Liberal, yet he has been hailed as chief by the Ultramontanes, high Tories, and fierce Radicals. He is devoted to progress, yet he has sanctioned the most reactionary of measures ; in keen sympathy with the poor, he has passed laws intensifying the sting of poverty ; a thorough-going educationalist—apparently at least—he has helped the priests to capture the schools. Whilst leading one party, he has constantly proclaimed his preference for the principles of the other, and when his own adherents have met with a defeat, he has carried on the government by the votes of their rivals. Amidst all his tergiversations, however, he has never forfeited for one moment the confidence of his sovereign, or the enthusiastic support of the more patriotic of his countrymen."

IRISH AND CZECH AND TEUTON IN ONE.

He comes of an old Irish stock ; the Taaffes once "played an important part in Ireland," even to the extent of gaining a peerage. The family is now a fairly equal blend of Keltic, Czech and Teutonic elements. Born in 1833, "he fought his first battles for the oppressed" on the playground of the gymnasium. As student, he was a thorough-going democrat. He rose rapidly in the service of the provincial governments. The Emperor and he had been as boys warm friends and constant companions, and when, after twenty years' separation, they chanced to meet again at Linz, they formed the close attachment which has lasted ever since. In 1867 he was called into the Imperial Ministry for the first time—as chief of three departments. The courtiers "scoffed at his ill-made clothes, and marveled that a man of his rank could eat and drink in third-rate restaurants, surrounded by clerks and tradesmen." "He is singularly lacking in the personal gifts by which most men win popularity ; he is no orator, no genius." But the Emperor believed in him, and made him premier in the very next year. After less than two years in this office he resigned, and in 1871 went off as viceroy of Tyrol. He found the province poverty-stricken, ill-governed, discontented, oppressed under a badly adjusted taxation, and left it, after seven years of vigorous reform, "one of the best governed and most contented provinces in the empire." In 1879 he became premier once more in a "ministry of reconciliation." Rejected by the Liberals, his natural allies, he won the support of the other parties by lavish concessions—so much so that his official residence was dubbed "the concession market." Yet he was able often to neutralize reactionary concessions. "Not the least of his merits as a strategist is the power he possesses of taking back with one hand what he gives with the other ; and of casting a glamor, as it were, over the husks he throws away." In his educational policy he secured as an administrator what he had seemed to surrender or imperil as a legislator. His protectionist policy is condemned, but as a set off are noted many useful measures of social legislation. In 1881 he lowered the franchise as far as his followers would let him. The writer declares that his last bill must pass "sooner or later, in one form or another," and the electorate rise at a bound from 1,700,000 to twice that number. His policy in regard to the nationalities was finally rendered impossible by Czech extremists. In laying down his fourteen years' premiership, he has stepped aside—the writer is confident—"only for a time."

THE KEY TO HIS CAREER.

The key to the Count's career is said to be this : "By nature he is a straightforward, plain-dealing man ; and it was only hard necessity that drove him to govern by playing off party against party, nation against nation, and lavishing on each in turn bribes, promises and threats. In any other country in Europe a minister who played Count Taaffe's rôle would be a miscreant and a traitor ; but in Austria it is otherwise ; there opportunism is the one art of ruling."

A GRAND OLD MARKSMAN.

SIR HENRY HALFORD, of Wistow Hall, Leicestershire, is styled by Mr. Harry How, in a bright "illustrated interview" in the *Strand*, as "The Grand Old Man of Shooting." Among his twenty-one prizes are "those of the Albert at Wimbledon in 1862 and the same trophy at Bisley in 1893, a record lapse of thirty-one years!" He was eight years old when he had his first gun, and last year, on his sixty-fifth birthday, "he adjourned to the field adjoining the house, which makes a capital range, and rattled off a dozen or two bull's-eyes." He is himself a practical gunmaker.

THE COLOR OF "THE BEST SHOOTING EYES."

"Whilst he was handling the tobacco," says the interviewer, "I noticed the difference between the shape of the right hand as compared with the left.

"'Ah!' said Sir Henry, in reply to my query, 'you can always tell the hand of a man who has shot much. Look at that second finger—it is quite disjointed; indeed, the whole hand is turned. Then many men bear the kiss of the rifle butt on the jawbone. The eyes, too, are a guide in singling out your rifle shot. I always think that blue or gray are the best shooting eyes; that's why the Scots are so successful at the target, for apart from their thoroughness in all they undertake, there are more blue eyes amongst them. An eye with a very small pupil is a great advantage. Brown eyes seldom come in; the marked exception to this, however, is Lamb, who is as good a shot as any man, and his are chestnutty brown . . .' Then I learnt that amongst shooting men the larger proportion of them are non-smokers. The veteran is a persistent smoker, and, practically, never shoots without a pipe in his mouth. 'Let me put in a plea for the pipe,' he said merrily. 'I was once shooting in one of the matches for the Elcho Shield—and shooting very badly. "Why, where's your pipe?" somebody standing by asked. "Light up—you'll do better." And I did. I hadn't been smoking for some little time, but with the first few puffs my very next shot was a bull's-eye!' . . .

"'The primary necessities to make a good shot are nerve, carefulness, a calm temperament, eyesight and power of concentration. I don't think you will find any man who is not a steady liver last long at shooting. Let young volunteers remember that the student of habit and a good shot must run together.'"

LORD SALISBURY AS A SCHOOLBOY.

It was at Sir Henry's ancestral hall that Charles I slept before the battle of Naseby, and again on the flight from Naseby to Leicester the King and Prince Rupert changed horses there. The royal saddles they left are still preserved as heirlooms. Among Sir Henry's school-fellows at Eton was the ex-Premier, of whom he remarked: "I think I may say that Lord Salisbury was one of the few boys who never got into any trouble. He was always very reticent kept a good deal to himself, not 'hail fellow well met' with the boys. He wasn't a boating or cricketing man, but more of the literary class. Everybody liked him."

MISS WILLARD AS "PRECEPTRESS."

IN the *Young Woman* Miss Willard continues the Story of her Life, describing now her career as "pupil and pedagogue." She speaks out of her own experience when she urges that "there is no teacher and no school that can compare to the companionship of large-minded and loving-hearted home folks. For ever and a day it will be delightful to me to remember that my dear mother taught me my A B C. She was not in the least bit of a hurry about it, either. . . . She let me run wild, playing the same games that my brother did, and given over to the big outdoors, until at last I fairly cried for my primer."

THE CHILD AND THE BIBLE.

Miss Willard, it seems, early began to busy herself with Biblical criticism. She says: "Father and mother . . . did not teach us creeds; I never saw a Catechism until I was emerging from my teens. We read the Gospels, and sang the dear old hymns hallowed by generations of reverence and affection. I think it was the hymns that did the most for me, for I had a hardy mind, and wondered how we knew that a book had come to us from God, and used to ask my mother if she could tell me who had seen it handed down, and whether it was fastened to heaven by a gold chain? She never said that I was naughty, but would take me on her knee and talk to me about the wonders of the world around us, and give charming little lectures on natural theology. "Not till she was fourteen years of age did Miss Willard go to school. To this fact we probably owe much of her unconventional charm and originality of initiative. Later she went to college at Chicago, "invested solid years in study, attained the usual diploma, and was afterwards preceptress of the natural sciences, and later on (when this institution was merged in the great University of the Northwest) became Professor of the History of the Fine Arts."

AS MORAL HORTICULTURIST.

A teacher for fifteen years, she confesses herself more intent on the "moral horticulture" of her two thousand pupils than on merely mental acquisition. She tells how she called her pupils together, told them that coming from Christian homes they knew as well as she did how they ought to act, and proposed that they should "make themselves behave." She formed them into a sort of upper and lower House of Parliament, where they made their own rules, and based their standing wholly upon conduct, thus giving the dull scholar an equal opportunity with those of nimbler mind. The lower House had their names on the Roll of Honor, the upper on the Self-governed list.

"This method worked so well that it diminished the friction of school-life to a minimum, making of what we call 'discipline' a means of culture to the students, and greatly relieving the teachers. Another admirable idea which turned the dramatic instinct to valuable educative ends was 'The Good Behavior Club,' which proved to be a favorite feature of the school. Teachers and pupils were all members, and

shared the offices. Representations were given of all social observances, from the White House reception to the morning call: personations of distinguished characters adding the dramatic charm so attractive to both young and old."

HOW PRINCESS LOUISE DID THE IRONING.

IN the *Woman at Home* Miss Katherine Lee gives a gossiping sketch of Princess Louise, as daughter and bride, sculptor and painter, as well as royal personage. She tells an incident of the Princess' sojourn in Canada, for which she is unable to cite the authority, but which she thinks "is worth repeating as an instance of that total absence of 'fine ladyism' which is, in its bad sense, so noticeably absent among our royal ladies. It seems that one day the Princess was walking without any attendants near her, when she came to a cottage. The only person visible was an old woman busily ironing one of her husband's shirts. The Princess was thirsty after her walk, and stopping at the cottage door asked the old woman if she would kindly get her a glass of water. The busy old woman somewhat shortly refused to do so. 'The spring was a little distance,' she said, 'and she was busy ironing her old man's shirt, for he was going with her to see the Queen's child on the morrow.'

"The Princess, no doubt with a secret thrill of amusement, said that she would iron the shirt if the old lady would fetch her the water. The compromise was quickly agreed on. The old woman went to the spring and the Princess did the ironing. . . . When the old woman returned the shirt was handed over to her. Needless to say, it was nicely ironed. . . . In exchange for the glass of water the recent laundry woman informed the astonished old woman that she was the 'Queen's child.' The startled old woman took the shirt, declaring that her old man should never wear it, but that she would keep it forever as a memento of the 'Queen's child.'"

THE ORIGIN OF THE NAME AMERICA.

THE much-debated question of the origin of the name America is considered by Dr. John Murray, of the "Challenger" expedition, in a most interesting article in the *Scottish Geographical Magazine* for November. He points out that in the Cantino map—the oldest but one of the New World, prepared in part, it is believed, by Vespucci—the name *Tamarique* occurs "towards Darien and in the direction of Nicaragua." To this day a little to the westward of Nicaragua is a range of mountains called *Sierra Amerrique*, inhabited by a tribe (once widely extended) called *Amerriques*. Again *Amarca* or *America* is shown by their Sacred Book to have been the national name of the Peruvians. *Tamarique* is, therefore, supposed to stand for *Terra Amerrique*. "It was an age of nicknames. What more natural than that Vespucci should be called America Vespucci? His Christian name of Amerigo would lend itself to, or

even suggest, the nickname. It is possible that the New World may have given Vespucci his celebrated name of Americus, and not Vespucci his Christian name to the New World."

THE MANUFACTURE OF "ANTIQUITIES."

MUCH curious information is contained in Sir John Evans' article in *Longman's* on the "Forgery of Antiquities." "Both counterfeits and forgeries," he says, "abound in every department of archæology." The fabrication of lapidary inscriptions is said to have begun some four centuries ago. The number and verisimilitude of the forgeries in the first half of this century was so great as to reduce considerably the value of genuine antique gems. "It is probable that more than half of the 'old' Dresden china now exposed for sale is counterfeit." The forgery of ancient carved ivories has developed "two distinct schools"—one in Southern France, the other near Cologne.

A DRIVE TO IMPROVE THE COMPLEXION.

The German Becker seems to have been the modern prince of antique coiners: "He engraved dies for upwards of 300 types of coins, principally Roman, and as most of these were struck in gold—a metal that does not change in appearance with time—he realized large sums from unwary collectors. . . . How to take off the appearance of novelty from the freshly-struck coins was a question of difficult solution. He solved it thus: He had a small box constructed, which he partly filled with iron filings, and screwed to the springs of his carriage, and in this box he placed his newly-struck coins, and then, as he expressed it, 'took his old gentleman a drive' on the road between Frankfort and Offenbach. The coins came out of the box, still fresh, but with the too glaring bloom of youth judiciously toned down."

The most frequent coin forgeries are those cast from genuine originals. "Wherever excavations are carried on . . . when coins are inquired for they are sure to be produced."

THE ART OF "PREHISTORIC" PRODUCTION.

Even "prehistoric antiquities" are manufactured. The making of "palæolithic implements takes rank as one of the fine arts" in the valley of the Somme and in the neighborhood of London. So with neolithic implements. "Modern flint axes and arrowheads are not so easily distinguishable from the ancient." A certain artificer of this craft, nicknamed "Jack Flint," when from their abundance his forgeries lost their sale, earned a somewhat honest penny by publicly exposing his tricks of trade. Objects of the bronze period are also obligingly prepared.

The writer concludes with the consoling reflection that "great as may be the forger's skill, not one of his frauds in a thousand escape detection," and that the existence of fraud sharpens and tests archæological discernment.

HOW TO MAKE BOYS MANLY.

PROFESSOR DRUMMOND gives a receipt in the December *McClure's*—a “New Process” as he deems it. He accepts the boy as he finds him, a primitive savage.

THE OLD METHOD THAT DOESN'T WORK.

“Let us suppose you have gathered a number of boys together, and treat them at first in the old or time-dishonored plan of having a Bible-class for them on Sundays. Infinite trouble and infinite bribery have brought these creatures together, and as they come solely to amuse themselves, your whole effort is spent in keeping order—in quelling riots, subduing irrelevant remarks, minimizing attacks upon the person and protecting your Sunday hat from destruction. No boy—I am not speaking of an ordinary Sunday school class, but of a *gamin* class—has yet succeeded in listening to you for two consecutive minutes. They have learned nothing whatever. Respect is unknown, obedience a jest. Even the minor virtues of regularity, punctuality and courtesy have not yet dawned upon their virgin minds. What is wrong is that they are street-boys, and you have treated them as if they had the motives and interests of domestic boys. The real boy-nature in them has never been consulted. You may be a very remarkable man, but it is not their kind of remarkableness, so you are a person of no authority in their eyes. They believe you to be a thoroughly good fellow in your way, only it is an earth's diameter from their way; and that you should know precisely what their way is, they guilelessly give you opportunity of learning every single second you spend among them.”

DRILL THEM!

The essential spirit of boydom that is the *sine qua non*, Professor Drummond finds in the moral effects of caps and belts and rifles and drills. He tells with charming humor how this transfers the power, in a meeting with boys, from their irresponsible multitude to the man who calls “tenshun!”

“The genius who discovered this astounding and inexplicable psychological fact ought to rank with Sir Isaac Newton. Talk of what can be got out of coal tar or waste paper! Why, you take your boy, your troglodyte, your Arab, your *gamin*, on this principle, and there is no limit to what you can extract from him or do with him. Look at this quondam class, which is to-night a Company. As class it was confusion, depression, demoralization, chaos. As Company, it is respect, self-respect, enthusiasm, happiness, peace. The beauty of the change is that it is spontaneous, secured without heartburn, maintained without compulsion. The Boy's own nature rises to it with a bound; and the livelier the specimen the greater its hold upon him.”

HOW THE BOYS' BRIGADE WAS STARTED.

“It is well known that not alone the *gamin*, but many boys of the working class, will submit to almost no parental authority. They are done with school before any habits of self-control are formed; and

being now wage earners, they become independent, and grow up untamed, unprincipled and lawless. What they need first of all is *discipline*. Now it so happens that there is one form of discipline which is not only the most thorough conceivable, but which is actually congenial to boy-nature; for *military organization* in every shape and form boys have a natural aptitude. It occurred, therefore, to a Scotch volunteer officer who took part in the work of a large Sunday-school to utilize this in the hope of securing a finer and more spontaneous discipline among his senior boys. By banding them into a military company for week-day drill he thought he could teach them valuable lessons—obedience, reverence, patience, manliness, neatness, punctuality—without their being directly conscious of it, and almost in the form of an amusement. Drill—not mere playing at soldiers, but regulation drill in its most thorough forms—was instituted, and kept up during a whole winter. At the end of the experiment the result was successful beyond expectation. The school was transformed, discipline was perfect, manners were acquired, the physical bearing was improved, the moral character was strengthened, and the foundations of religious principles laid. Other companies were speedily formed in the neighborhood on the model of the first. The idea was gradually taken up in one district after another, and the movement spread throughout the country.”

JERUSALEM OF TO-DAY.

MR. CHARLES A. DANA contributes to the December *McClure's* an excellent paper on Jerusalem, in which he tells of the city as it exists to-day. He says: “Roughly speaking, then, Jerusalem in its highest splendor was not larger than the area of the Central Park below the reservoir. Moreover, this limited space has always been diminished by the extent of the area leveled and walled, set apart of old for the Temple, and still held sacred by the Turkish authorities against the erection of ordinary buildings. This area contains, I should suppose, from thirty to thirty-five acres. It is the one conspicuous green spot in Jerusalem. It is covered with grass and adorned with trees; and the only buildings on it are the glorious and beautiful Mosque of Omar, the Mosque of Aksa, and one or two other dependent structures.

“The present population of Jerusalem is not far from forty thousand, and more than half are Jews. They live in a separate quarter of their own, as do also the various divisions of Christians, as the Armenians, the Greeks and the Protestants. All these quarters are densely built, with narrow and irregular lanes for streets, but the prevailing prosperity does not seem to reach the abodes of the Hebrew. The indications are all of extreme poverty. A synagogue was pointed out bearing an inscription showing that it was the gift of a Paris Rothschild; but its mean appearance and unattractive surroundings bore no suggestion of critical refinement in the congregation. The articles of food set out for sale in the petty

little shops were often squalid and repulsive. We came so often upon spoiled salt fish among the stores exposed by the venders, that we concluded it must form a regular element of diet in the quarter. There was no visible sign of industry by which the people might earn their living; and no one need be surprised to learn that in various parts of the world the well-to-do and charitable Jews are regularly called upon to contribute to the support of their pauper brethren in Jerusalem."

MR. LILLY'S BLAST AGAINST DEMOCRACY.

IT is quite in the academic style that Mr. W. S. Lilly proceeds to enlighten the readers of the *Fortnightly* on the nature and method of true self-government. He is moved with a lofty pity at the vulgar notion that self-government is realized by current democratic institutions. He draws—chiefly from Mr. Bryce's writings—a picture of the partisanship corruption and "boss" rule which prevail in the United States, and exclaims: "This is what you call self-government in its greatest perfection!" He then turns to Great Britain and says: "Self-government in England, as in America, means party government; and in England, as in America, the two great parties represent little more than a desire for power and place. . . . The fact is certain that to win or retain office, not to carry out principles, has become the dominating motive of the two chief political parties. . . . True, the system of Ring-and-Bossdom is at present inchoate among us. But surely the Parliamentary party, of which Mr. Bryce is an ornament, is essentially a ring, and, most assuredly, the Prime Minister is a Boss in *excelsis*! And he rules his followers with an absolute sway which an American Boss might envy. . . . In England, then, as in the United States, 'self-government' really means bossdom in fear of the Irish vote."

Mr. Lilly knows no more signal proof of the deep degradation of English public life than the way Mr. Gladstone thrust Home Rule on his reluctant adherents.

He next looks to France, but finds there the same story repeated. "Self-government in France, as in the United States, is party government; nor does the machinery of politics in France differ substantially from the American, although it is less highly organized. . . . These parliamentary engineers are the bosses of France, who set up one phantasmal ministry after another, filling meanwhile their own pockets."

WHAT TRUE SELF-GOVERNMENT IS.

From these "counterfeits of national self-government," Mr. Lilly passes on to consider what the true article is. "Self-government in an individual man means the supremacy of the rational nature over the emotional; the predominance of the moral over the animal self. The lower powers and faculties of a self-governed man are brought into subjection, and kept in subordination to the higher."

So is it in the nation. But—and here we come on a piece of Toryism as old as Plato—"in the social

organism the masses (as the phrase is) represent passion, impulse, emotion." And they must be ruled by reason. "Civil society arises from the nature of things." The State must be based on morality, on justice therefore. Justice requires that every man "should count in the social organism for his true political value. And the political value of men differs greatly."

"All the elements of national life should be represented in just proportion. All should be subsumed in the reason of the organic whole. . . . 'pure democracy,' as it is called, the unchecked domination of numbers, is not a form of government at all."

For the present deplorable state of things Mr. Lilly has two remedies to offer: "the increased separation of the executive from the legislative government;" and "a strong second chamber" as a "safeguard against the tyranny of a debased popular chamber."

A EULOGY ON KHAMA.

MR. GEORGE COUSINS, of the London Missionary Society, supplies the *Leisure Hour* with a glowing eulogy on "Khama, the Bechwana Christian Chief." He recounts how Khama as a youth came under missionary influences, and how his refusal, "on account of the Word of God," to take a second wife enraged his father. Khama suffered much under the reigns of his heathen father and uncle. It was only in self-defense that Khama revolted, drove out his uncle, and became king in 1872. On his accession he refused to perform the customary royal rites. "Khama emphatically announced his own adherence to the Word of God. He would not prohibit heathen ceremonies, but they must not be performed in his 'khotla,' and as their chief he would contribute nothing towards them. He was about, by public prayer to Almighty God, to ask a blessing upon their seed sowing, and afterwards would set to work. Whoever wished to have his seed charmed could do so at his own expense. . . ."

"For twenty-one years Khama has been in power, and his reign throughout has been in thorough harmony with that early declaration. All who know him bear testimony to his consistent life, his sagacious and enlightened rule, and to the general strength, probity and nobility of his character."

AS A RULER.

Mr. Cousins thus sums up this British ally: "Undoubtedly this chief stands out conspicuously among South African princes as the finest, noblest of them all. He rules with a firm hand, is soldierly in bearing, a keen sportsman, a good rider, every inch a man; but combined with this strength there is remarkable patience, gentleness and kindness of disposition, and none who know him doubt his sincerity or earnestness as a Christian. The remarkable way in which by the force of his own example and conduct he has led his people forward in the pathway of enlightened Christian progress furnishes striking evidence of this."

THE PERIODICALS REVIEWED.

THE FORUM.

IN the preceding department will be found reviews of the articles on the tariff by Mr. A. Augustus Healey and Hon. W. J. Coombs; "The Beginning of Man and the Age of the Race," by Dr. D. G. Brinton; "How to Deal with the Filibustering Minority," by Mr. John B. McMaster; "The Most Popular Novels in America," by Mr. Hamilton W. Mabie, and Mr. Woodrow Wilson's criticism of Mr. Goldwin Smith's "History of the United States."

THE CORRUPT USE OF PATRONAGE.

"Are Presidential Appointments for Sale?" is the subject of the first article, the general tone and scope of which is suggested by the writer, Mr. William D. Foulke, in the following paragraph: "We have had to witness a great many instances of the corrupt use of patronage. Offices, high and low, have been divided among party bosses, and services, often discreditable, rendered to political organizations, have been rewarded by public place and paid out of the treasury of the State. We have seen a code of morality which even in the army has become extinct revived in times of peace under republican government. Our political sensibilities have become so blunted that we have almost come to believe it right that the victor should carry off the spoils. In our municipalities, bargains are made and money buys the place and we pay little heed to it. Our State legislatures have been corrupted and men have won their way through the power of the dollar even to the Senate of the United States. But until very recent years we have had no reason to believe that the sanctuary of our Federal Executive had been invaded by the defiling influence of gold. It is this last step which indicates only too clearly the direction in which our political morality is moving. The appointments of Mr. Wanamaker and Mr. Van Alen are two long steps downward and backward toward the abyss from which free government can never rise. The descent must be stopped before it is too late."

FRANCIS PARKMAN.

Reviewing the life of Francis Parkman and his work, Mr. Julius H. Ward thus sets forth the historian's wonderful gift of historical imagination: "He dwelt so entirely with his subject that he could feel it to his fingers' ends. It inspired and mastered him, and when he attempted to tell the story he made it as real to the reader as it was to himself. It caught hold of the roots of his mind, and it held him as he holds his readers. He wrote these narratives as the painter fills out his canvas. He put feeling and color into the story, and gave it the lights and shades of actual life, lifting it, as all great literature is lifted, so that it reflects the changes of human conflict as they are seen to-day. The result is that the story is like Shakespeare's plays. It reproduces the past and has the touches of life in it. The history is enjoyed by the young as much as by the scholar, and it enters by right of inheritance into the permanent literature of the country. It is work done in simplicity, with power, with an adequate sense of its value, and with a thoroughness that produces the best results. This historical imagination is the rarest of gifts, and it lifts the work of its possessor to the highest plane. Parkman had the power to throw

into his story the elements which made it real and graphic, and he felt its meaning so intensely that it throbs and thrills in his narrative and makes it a transcript of actual life. What is remarkable in him as an historian is that this power to infuse his narratives with the passion and excitement of life without apparent effort is almost as prominent in his first volume as in the latest; and yet nearly half a century lies between them."

CHILD STUDY.

Mr. G. Stanley Hall contributes a paper, the purpose of which is suggested by its title, "Child-Study, the Basis of Exact Education." Mr. Hall glances hastily at a few of the methods which have been employed in the study of children, and points out some of the most salient results that have been accomplished. He concludes his paper with the practical suggestion "that one or two of the largest colleges should cause a well trained and tactful man to devote his time to the study and improvement of college life, calling freely upon others to co-operate. Abundant material for the study of the natural history of students is afforded by the more than two hundred publications in the country, the court, code of honor, fraternities, etc., the tabulations of choice of study with reasons therefor, essays, and now the daily themes at Harvard, religious life and needs of students and above all habitual acquaintance with students and personal friends on the ball grounds—this suggests a new field and method which might be called the higher anthropology."

HOW BETTER TO UTILIZE RICH MEN.

Why do we not make better use of our rich men is the subject discussed by Mr. Frederic Harrison. "We waste them," he says, "and let them run to seed, a burden to themselves and a nuisance to the public." He urges that we ought "to utilize and make citizens of them, lifting them from inaptitude and degradation to be respectable citizens of the commonwealth." He points out that the rich men of the United States have taken the lead of the rest of the civilized world in the matter of giving to the public splendid gifts of libraries and colleges. After urging the rich men of the Republic to continue the good work of endowing institutions for the public, Mr. Harrison has a word to say for the artistic rather than the scientific or educational form of endowments. There are, he says, certain forms of art that no State or locality can ever provide for itself out of its public revenue, and he appeals to the rich men to supply these.

THE NORTH AMERICAN REVIEW.

IN another department are reviewed at length Governor Russell's article on "Political Causes of the Business Depression," "The Mission of the Populist Party," by Senator Peffer; "Parliamentary Manners," by Hon. Justin McCarthy, and three articles on the Hawaiian situation.

THE BATTLE SHIP.

Captain W. T. Sampson, of the United States Navy, writes on the battle ship. His definition of a battle ship is "that fighting ship which combines in the highest possible degree the powers of offense and defense." We have cruisers, large and small, protected cruisers, armored

cruisers, commerce destroyers, gunboats, torpedo cruisers, torpedo boats, etc., each of which has its characteristics in which speed, the number and size of guns, coal endurance and manœuvring powers are made much of, but none of them, or all of them together, could be expected to meet the battle ship in fair fight. "She mounts heavy guns to pierce the armor of her enemies; she mounts numerous guns of lighter calibre to enable her to meet similar fire from all sorts of craft and to destroy the quick-moving torpedo boats which would escape the slow-working, heavy guns; she carries armor to protect herself against any but the heaviest projectiles, and, so far as possible, against even these; she carries torpedoes to destroy an enemy who may, in the manœuvres of battle, come within her reach; she carries such a supply of coal and ammunition as will enable her to perform her duty between the times when she can renew her supply. Being essentially a fighting machine, she does not require high speed to enable her to escape from an enemy. When war shall come between any of the great nations which depend in whole or in part upon their naval strength, it will be the battle ship which will settle the issue. And such, in brief, is the battle ship of to-day."

OUR PATENT LAWS.

Mr. W. E. Simonds, discussing our patent laws, suggests that they should be amended in two particulars: 1, That no innocent user of a "manufacture" or "composition of matter" shall be sued for infringement so long as the maker or seller can be reached; and, 2, that a patent shall begin to run not later than three years after the first application thereof.

WHAT DREAMS ARE MADE OF.

Dr. Lewis Robinson sums up his article, "What Dreams are Made of," as follows: "1, It would be seen that, owing to the unceasing 'unconscious cerebration' which is a necessary concomitant of our powers of intellect, the brain is always in part awake, and is especially active in shifting memorized matter; 2, the cerebral centers connected with the sense organs are (for some reason which we cannot at present explain) continually and independently employed in stimulating impressions from without; 3, certain of the senses (especially that of hearing) remain open to external influences during sleep and convey actual vibrations to the brain; 4, there exists an ever active and purely involuntary predisposition on the part of the mental apparatus to compare and collate all the messages which come, or seem to come, from without, through the sense channels; and to collate these again with what is brought to the consciousness by involuntary recollection; 5, associated with this there is a tendency (also automatic) to combine the evidence (real or bogus) so collected into a coherent whole, and to make the result either explain the more emphatic thoughts or impressions, or else answer some questions which occupied the attention before sleep began; 6, no voluntary power exists during sleep to pick out from the jumble handed in that which is relevant to the problem to be solved, or even to discern whether any piece of *pseudo* information is appropriate or the reverse for such a purpose; 7, just as there is no power to discriminate real from false impressions at the outset, so, throughout a dream, we are completely oblivious to the most glaring fallacies and inconsistencies."

RAILWAY ACCIDENTS.

Mr. H. G. Prout, editor of the *Railway Gazette*, compares the number of railway accidents in this country with that in England, concluding that it is anywhere from

five to sixteen times as dangerous to travel by rail in the United States as in England, and attributes this to the facts that England has per unit of railways lines more than ten times as much double tracking, eighteen times as much block-signaling and ever so much more interlocking of switches and much better single-tracking.

THE ARENA.

JOHN DAVIS, M.C., writes an interesting account of "The Bank of Venice," that famous institution, "the most perfect of its kind that was ever devised by the mind of man," on which the "Queen of the Adriatic" laid the foundations of her greatness and wealth during the middle ages. Deposits of specie were made in the institution and used by the government in carrying on its wars and foreign relations, and credit was given the depositor on the books of the bank. The specie was never returned and no promise was ever made to do so, but the credits, being exempt from taxation, were eagerly sought and finally rose to a value actually above that of the coin of the republic,—ten ducats in bank credits equaling twelve in gold. No notes were issued, but the credits were everywhere accepted and negotiable. With this system, there could be no hoarding, no contraction or inflation of the currency. The government held all the metal in the country. The author thinks the system applicable to the United States with the modification that notes in place of credits be allowed the depositor.

CAN THE BIMETALLIC STANDARD BE RESTORED?

"Can the United States restore the bimetallic standard of money?" Dr. George C. Douglas thinks it can do so by means of a discriminating tariff, practically closing our markets to countries like England and Germany, which are monometallic, while filling the place of their products by the goods of America, France, Italy and Holland, and by the enactment of a law providing for free bimetallic coinage. He contends that our markets are too valuable to England and Germany to be sacrificed in the interests of their money-holding classes.

THE WONDERS OF HINDOO MAGIC.

Craving for the marvelous and supernatural is part of a human being's inheritance, and there is much food to satisfy it in "The Wonders of Hindoo Magic," by Heinrich Hensoldt, Ph.D. Commenting on the later tendency of scientists to accept with more credence the tales of Eastern travelers, he proceeds to offer some explanation of the wonder-working powers of the Hindoos. As the Greeks were given to plastic art and the passion of Egypt was for stupendous buildings, so the ruling fancy of the Hindoos from remote ages has been for a "speculative philosophy" based on intuition, and Mr. Hensoldt does not doubt that they have discovered some forces of which we are ignorant, and among the first of which was hypnotism. The conjurers may be divided into several classes; the lower orders, Fakurs and Pundits, mere street jugglers, plying their trade for a livelihood; the higher classes, Yoghis and Rislies, who, living in the wilderness, are seen but seldom and whose miracles are never used for gain, but as the Disciples used theirs, to attract attention before telling the story of their faith, generally one of the "Birth-Tales" of Buddha.

"The Practical Application of Hypnotism in Modern Medicine" is illustrated by Dr. J. R. Cocke, by cases from his private and hospital practice.

THE CONTEMPORARY REVIEW.

THE December number of the *Contemporary* contains many solid articles, but none, perhaps, of the most striking kind.

LORD COLERIDGE AND THE POET BROWNING.

Lord Coleridge discusses the time-honored distinction between education and instruction, describing education as the drawing out of the powers of the mind. He urges that technical instruction, however valuable, requires, in order to heighten its value, more general culture. The authors which he would recommend for special study stand in this order—Shakespeare, Milton, Wordsworth, Gray and Wolfe. He omits Tennyson; Browning he also omits, because, though admiring him, he has not always understood him. He tells how the poet used to send his volumes. "Soon after one had thus been given me, he asked me how I liked it. I replied that what I could understand I heartily admired, and that parts of it, I thought, ought to be immortal; but that as to much of it I really could not tell whether I admired it or no, as I could not understand it. 'Ah, well,' he said, 'if a reader of *your* calibre understands ten per cent. of what I write I think *he* ought to be content.'"

THE DEGRADATION OF THE LITTLE TOE.

The controversy which has been proceeding in the *Contemporary* as to the possibility of the transmission of acquired character, in which Mr. Herbert Spencer has taken the affirmative and Professor Weismann the negative side, is continued this month in a rejoinder by the synthetic philosopher. Much of the article is fully intelligible only to biologists, but it opens with a reference to the curious and much debated degradation of the human little toe. It was in the first instance supposed that the progressive disappearance of his digit was due to the inherited and accumulated effects of boot pressure. Professor Weismann had pointed out that the same fusion of the phalanges was found among people who go bare-foot, and in Egyptian mummies. Mr. Spencer rejoins by carrying the explanation further back. He points out how the change from arboreal habits to terrestrial habits has led to the development of the great toe as being nearer the line of direction. The inner digits have increased by use, while the outer digits have decreased by disuse.

BLACKCOATS ON THE WARPATH.

Mr. John Darfield does not understand why so much noise has been made about the parish charities which are claimed for the disposal of the new parish councils of England. He shows that "in the country at large £400,000 a year spread over fifty-two counties is all that is touchable by the bill." "This gives an average of about £77,000 per county." He laments "the waste of energy that has taken place in the whole army of blackcoats going on the warpath for such a twopenny-halfpenny matter as this clause turns out to be. It is the more striking, because, while the thirteenth clause gave to the Parish Council so very little, the definition of ecclesiastical charity stamped as Church property what had never been the Church's before."

OTHER ARTICLES.

Mr. Crawford gives an interesting sketch of "McMahon and his Forebears." Professor Max Müller has been aroused by "a most alarming bombshell" thrown by Mr. James Darmesteter, who assigns the Gathas, the oldest portion of the "Zend-Avesta," to the first century A.D., whereas the generally adopted date is from 2000 to 1500

B.C. He admits that from a strictly historical point of view it would be difficult to resist Mr. Darmesteter's criticism, but he brings forward strong philological arguments in support of the traditional date. Mr. Rendel Harris takes occasion from the recently discovered Diatesaron of Tatian to show that Bishop Lightfoot, whose defense of the Johannine authorship created a general revolution of opinion in its favor, has understated, rather than overstated, his case. Dr. Anthony Traill treats of the compulsory purchase of land in Ireland. He complains of the way in which the seller is now harassed by costs of proofs of title. He urges more freedom in the creation of perpetuities by the fining down of rents.

THE NINETEENTH CENTURY.

FIFTEEN articles, for the most part bright, instructive, suggestive and brief, make the *Nineteenth Century* stand out this month superior to the influences which seem to beset the fag-end of the magazine year. Mr. Michael Davitt leads off by tearing up what he calls "Fabian Fustian." Mr. A. C. Swinburne's "Recollections of Professor Jowett" do not give us the Master again quite as vividly as the work of many a humbler and more Boswellian writer. He describes him on his literary and æsthetic sides. Dr. Jowett was, he tells us, "perhaps the last of the Old Whigs." He greatly admired Dickens, and would have ranked him above Tennyson and Carlyle. Of Carlyle he spoke with distaste and severity, as a preacher of tyranny and apologist of cruelty. Voltaire elicited expressions of dainty distaste. He delighted in Scott. His favorite Shakespearian play was "The Merry Wives of Windsor." He showed his general admiration of Browning's genius along with a comparative depreciation of Browning's works.

THE ITALIAN SENATE.

The Marchese F. Nobili-Vitelleschi describes the Italian Senate in the first of a series of articles on "Upper Houses in Modern States." In Italy "the appointment of an unlimited number of life Senators is reserved to the king. But the royal prerogative of appointment is limited to twenty-one categories of persons past the age of forty. It is only among these that the king can choose his Senators." The writer suggests that this method of selection from categories should be carried out by electoral colleges in each class. Dr. H. P. Dunn tells "What London People Die of" in an article crammed full of fact and thought. London, he shows, is increasing in healthiness; once, in 1881, its mortality fell below that of England as a whole. The most startling fact he brings out is that the death-rate for diseases of the nervous system in London is almost the lowest among all registration districts. The wear and tear of city life lead one to expect quite the opposite result.

OTHER ARTICLES.

M. Yves Guyot, late French Minister, laments as an Individualist over "Socialism in France," that whereas it was once a movement for liberty, it now might be defined "The intervention of the State in contracts of labor, always directed against the employer and to the exclusive profit of the laborer," to result in "the seizure by the State of the whole economic activity of the country and the forcing of every man fit to work into the ranks of State functionaries."

Mr. W. B. Stevens recounts the singular diplomatic relations between "Queen Elizabeth and Ivan the Terrible" and their successors. Russia seems to have been spe-

cially eager to form an English alliance. The execution of Charles I so incensed the Czar that he straightway expelled all English merchants from Russia.

Mr. Theodore Bent traces "the origin of the Mashonaland ruins" to builders well versed in geometry and studiously observant of the heavens, probably of Semitic race and Arabian stock. Rev. Edward Miller, under the ironic heading "Confessions of a Village Tyrant," retails his social service as village parson. Mr. H. D. Traill discusses "the anonymous critic," and decides in favor of keeping him anonymous. Mr. W. Laird Clowes describes the fortifications and accommodation of Toulon and tabulates the strength of the French fleet, to show that in the Mediterranean France is both stronger and readier than England.

THE FORTNIGHTLY REVIEW.

IN common with most of the English December magazines the *Fortnightly* falls rather below the average. It contains much interesting matter, but hardly any article of the first rank. Mr. Lilly's curious invective against popular notions of "Self-government," "Nauticus'" instructive essay on "History and Sea Power," Canon Barnett's methods with "the Unemployed," and "X.'s" satire on "the Rhetoricians" of "the Ireland of to day," have received notice elsewhere.

LETTERS OF KEATS.

Mr. A. Forbes Sieveking contributes "some unedited letters of Keats," addressed to two sisters named Jeffreys, the son of one of whom made them over to Mr. Richard Archer. Mr. Sieveking thinks that now for the first time the family at Teignmouth, with whom Keats corresponded, and about whose names he was very reticent, can be identified with these Jeffreys. In one letter Keats coins a convenient word, where he says, "Many interesting speeches have been demosthenized." A passage in another letter recalls Browning's "What porridge had John Keats?" "One of the great reasons that the English have produced the finest writers in the world is that the English world has ill-treated them during their lives and fostered them after their deaths. They have in general been trampled aside into the bye-paths of life and seen the festerings of Society."

MAORI SOCIALISM.

Mr. Fred. J. Moss describes "A South Sea Island and its People:" "In all their islands each Maori has some share in the common possessions, and personal want in the midst of public plenty is unknown. . . . Famine may possibly come, but cannot starve one without starving all. Children bring with them no care, being provided for as soon as born. Work is made a pleasure, and the poorest breathes as pure an air and is nearly as well fed and clothed as the ariki whom he reverently obeys. . . . There is not a lunatic, a jail, nor a consciously degraded person. The sovereign and the chiefs are in touch with the people, and the people are in touch with one another. The Maori, in short, is a good deal of a Socialist." Mr. Moss suggests the formation of a society to inquire into the unseen biological causes of Maori decay.

Mr. A. R. Wallace continues his discussion of the Ice Age and its work, and maintains, against the notion of "earth movements of various kinds," Sir A. Ramsay's theory of the ice-erosion of the valley lakes of highly glaciated regions. A dialogue by the late Francis Adams canvasses the idea of "a hunt for happiness" as the law of life.

THE NATIONAL REVIEW.

THE December number rises distinctly above the general high level of this review. Lord George Hamilton's admirable article, "Is England's Sea Power to be Maintained?" is noticed elsewhere.

MATTHEW ARNOLD'S WORKS.

Mr. Leslie Stephen's study on Matthew Arnold is a feast of fat things. He attributes to Arnold's poetry, "the quality, if not of inevitableness, of adhesiveness." The "Scholar Gypsy" is selected as his masterpiece. "The function which he took for himself was to be a thorn in the side of the Philistine; to pierce the animal's thick hide with taunts, delicate but barbed; to invent nicknames which might reveal to the creature his own absurdity; to fasten upon expressions characteristic of the blatant arrogance and complacent ineffable self-conceit of the vulgar John Bull, and repeat them till even Bull might be induced to blush."

THE IRISH PROBLEM.

The O'Connor Don reminds his Unionist readers of "The Unsolved Irish Problem." The Home Rule bill, "whatever may have been its shortcomings, has been read a third time. It has been passed by the democratic branch of the legislature of the United Kingdom. It is idle even for the most extreme Unionist to shut his eyes to these facts. The step taken can scarcely be retracted, and some form of what is called self-government for Ireland will haunt whatever Ministry may be in power." What, then, must be done? Independence is out of the question; Federation must certainly not begin with Ireland. The thing to do is to hold the Imperial Parliament every three years in Dublin, in Edinburgh, and in London. Let there be also a royal residence in Ireland. This rotation of location would meet the needs of the case.

PRESBYTERIAN UNION.

Rev. Dr. Story approaches the subject of "The Kirk and Presbyterian Union" from the standpoint of one who loves the auld kirk very much, but whose zeal for Union is rather tepid. "In order to unite with the Established Church the Dissenters would have to surrender nothing. The U. P.'s would still retain, in unimpaired vitality, both the theory and the practice of Voluntaryism." The Free Church would simply revert to her vaunted "disruption principles," which include Establishment. The Church, on the other hand, in accepting Disestablishment would make an enormous surrender. "Even were the sentiment of Union predominantly strong in the Established Church, we could hardly expect it to gratify itself at such a sacrifice. But, in point of fact, that sentiment is one which evokes little enthusiasm among Churchmen."

SCHOOL CRISIS IN ENGLAND.

Rev. Canon Hayman, D.D., discusses "The Voluntary School Crisis" in language more vigorous than convincing. He begins by describing Mr. Acland as the "modern successor" of Julian the Apostate, "the demagogue-tyrant of a department, [who] is profiting by the august precedent, and destroying religion by destroying religious schools. That universal Board Schools mean the extinction of vital religion from education is as certain as symptoms of tendency can make any statement concerning human society."

He is deeply moved by the "official silence" of Anglican dignitaries at this crisis, and concludes by asking, "Will not the verdict of posterity be that the English Church in the crisis of her destiny counted many excellent bishops, but lacked an episcopate?"

THE NEW REVIEW.

THE *New Review* contains several timely and attractive articles. Mr. Macdonald's "Problem of the Unemployed" is noticed elsewhere.

Lady Knightley, of Fawsley, enumerates, in a most businesslike catalogue, the following "New Employments for Educated Women:" Giving lectures and teaching to County Council Classes; carving; as sanitary inspectors—a class which ought to increase and include in their purview workhouses also; horticulture, as learned at Swanley, Kent; as librarians—a calling likely to be overcrowded; as University Extension Lady Lecturers; house decoration; plan tracing; wood engraving; painting on glass; dispensing; as trained nurses in workhouse infirmaries; as lady nurses for children of the upper classes; secretarial work; care of insane patients; and rent collectors or managers under Miss Octavia Hill's scheme.

Mr. Frederick Boyle bewails "The Decay of Beauty," and traces it to the artificially secured survival of the unfit, the "swaddling" of almost the entire body in woollens, the disuse of the bath, and other causes. Mlle. Blaze de Bury gives a most interesting account of Charcot, as physician, professor, in his relations to hypnotism, and as head of the modern neuropathic school. Apparently a skeptic, he believes strongly in the personal faith of the patient in his doctor, adviser, and ultimate cure.

Prof. Max Müller contributes a beautifully picturesque sketch of "Constantinople in 1893." He wonders why so many people go to Switzerland and Rome, when a few days more would bring them into an entirely new world, and into a climate in some seasons almost perfect. He has been much impressed with the Turks: "Whatever may have been said of the 'Sick Man,' there is many a sign that the Turk has recovered, and that he will prove a tough morsel to whomever wishes to swallow him. The pure Turk is strong and steady, and determined to fight to the bitter end before he surrenders what for over four hundred years he has called his own."

"The Indictment of Dives" is Mr. W. S. Lilly's epitome of Socialism. Of the thousand volumes written by Socialists, "all bring the same charge, substantially, against Dives—that he is a thief; that is the head and front of his offending; their first count in the indictment against him. 'Property is theft.' Is this true?"

Not of private property in the abstract, he replies: "The philosophical justification of private property is that it is necessary for the explication of personality in this work-a-day world." But as to property in the concrete, Mr. Lilly fears the charge is too true."

THE CANADIAN MAGAZINE.

REV. HERBERT H. GOWEN contributes a good article on salmon fishing, in which he tells of the methods employed in netting and canning on the Fraser river. Into the small city of New Westminster alone this industry brings about a million and a half dollars each season. Every fourth year there is a tremendous glut of salmon, and in an average season of six or seven weeks a boat manned by two men, who have to wield a great net 300 feet long, will take from 6,000 to 11,000 fish, while an average cannery packs about 200,000 fish in a season.

In a paper on Lord and Lady Aberdeen, Mr. J. Castell Hopkins is outspoken in his efforts to correct any too fervid belief on the part of Americans that the new Governor-General has any specific aims toward closer connection between Canada and the United States.

"Such utterances overlook the vital fact that Canada

does not exist for the sole purpose of unifying British and American sentiment, and that the Governor-General of Canada is not here as an ambassador from Great Britain to the United States, but as a representative upon Canadian soil of the sovereign of our own Empire. The great interest so generously taken by Lord and Lady Aberdeen in the Chicago fair has led, in certain quarters, to this strange misconception of their duties."

THE CENTURY.

THE December *Century* has a special cover in which the holly leaves suggest Christmas in a cheery way, and the art papers and poems, as is the custom of the *Century* at this season, suggest the new year even more strongly in their portraits of those who made the first Christmas. Indeed, this is distinctly a holiday number and matters of more serious discussion are discarded for the time to give place to papers on the "Old Dutch Masters" by Mrs. Van Rensselaer, to an especial article for artist folk on Rembrandt by Timothy Cole, to "Chats with Famous Painters," with very charming bits and studies reproduced by Wallace Wood, and to Mr. Hopkinson Smith's first article in the artist's adventure series.

The feature of the number so far as fiction is concerned is the beginning of Mark Twain's serial novel, "Pudd'n Head Wilson," the scene of which is laid in Southwest Missouri thirty-five years ago. The first chapters give but small indication of that humor which made Mr. Clemens' fame. Curiously enough, the plot, if one may presume to prophesy from the first chapters, is going to center around the mixing up of two babies, one of whom is a white child and the other a mulatto with a slight strain of negro blood, the two being under the charge of the fond mulatto mother; so that we may expect to find Mark Twain drawing some healthy moral concerning the race problem before we are through with "Pudd'n Head Wilson."

Apropos of the current discussion for and against football in the colleges, William Conant Church contributes an "Open Letter" to this number, in which he gives some striking facts to show that the football player is just as good and faithful a student as his less athletic fellow, and that the effect of the training upon the player himself is highly advantageous in its obligation to keep good hours, to preserve strict temperance in food and drink, to refrain from the use of tobacco, to eat only nourishing food and be systematic with cold baths, rubbing and healthy exercise. He thinks it even more important, perhaps, that it teaches the American youth what they find very hard to learn—that they must give prompt and direct obedience to instructions. Says Mr. Church:

"It is doubtful whether the percentage of accidents among undergraduates would lessen were football forbidden. Nature will exact her tribute in physical injuries for her bestowal of surplus energy upon the young, and I have known one young man to break an arm three times in jumping over horse-posts. The physical dangers, such as they are, could be greatly lessened by a proper regulation of the game. It should be recognized as a part of the college curriculum, to the extent at least of encouraging every student to participate in it, grading the players according to their several abilities. It is found that systematic training reduces the risk from injuries. If football is beneficial, as would appear to be the case, the benefit should be extended to all students alike. As it is now, those who most need the exercise are debarred from it by the natural disposition to exclude all

but the sturdier men. At Annapolis and West Point physical training is an essential part of the course, and it should be so in every college. It will be so when we have wholly escaped the influence of the false doctrine that the body is the instrument of Satan, and must be bound in fetters as a preliminary to intellectual and spiritual development."

HARPER'S.

WE have reviewed elsewhere at length Mr. T. P. O'Connor's article on the House of Commons. Mr. Thomas Nelson Page, who is always charming, and who is especially so in his native and appropriate subject of Virginia, writes this month on the "Old Dominion" in a paper which Mr. Reinhart's illustrations make exceedingly attractive. Of course we can leave Mr. Page alone to find the romance, which, to be sure, is anything but hard to find in "Ole Virginny." As to the material reconstruction of the State, he bears witness to the great change which has come from the terrible period of reaction just after the war. He concludes that the boom which carried values and hopes in Virginia to inflated proportions really never stopped the steady advance on lines of commercial prosperity which the State has made for the last ten years. He contends that the time has fairly come when the Old Dominion is a good place to go to instead of being a good place to come from. The Southwest is furnishing great foundries and furnaces with iron and coal, and hundreds of saw mills with fine lumber, and in the east, where some of the poorer sections are to be found, a new industry has grown up in the trucking which furnishes fruits and vegetables for the markets of the Northern cities.

In his "Editor's Chair" Mr. Charles Dullely Warner takes a conservative step in his advocacy of criticism as a concomitant to our literature. He thinks that it is time our strong spontaneous literary growth should be, if not checked, at least qualified by criticism, and he talks very plainly in his statement of opinion that we are quite an arrogant young nation in our disavowal of the need of any such criticism.

"We are growing in the habit of being sufficient unto ourselves. We have not Philistinism, but we have something else. There has been no name for it yet invented. Some say it is satisfaction in superficiality, and they point to the common school and to Chautauqua; the French say that it is satisfaction in mediocrity. At any rate, it is a satisfaction that has a large element of boastfulness in it, and boastfulness based upon a lack of enlightenment, in literature especially a want of discrimination, of fine discernment of quality. It is a habit of looking at literature as we look at other things; literature in national life stands alone; if we condone crookedness in politics and in business under the name of smartness, we apply the same sort of test—that is, the test of success—to literature. It is the test of the late Mr. Barnum. There is in it a disregard of moral as well as of artistic values and standards. You see it in the press, in sermons even—the effort to attract attention, the lack of moderation, the striving to be sensational in poetry, in the novel to shock, to advertise the performance. Everything is on a strain. No, this is not Philistinism. It is sure, also, that it is not the final expression of the American spirit—that which will represent its life or its literature. We trust it is a transient disease, which we may perhaps call by a transient name—Barnumism."

The Christmas *Harper's* is a very beautiful magazine in its gold, white and green binding and in the exceptional array of contents. The artistic feature centers in the last

of the Abby-Lang exploitation of Shakespeare's comedies and the artist's beautiful interpretations of the "Two Gentlemen of Verona" *dramatis personæ* are rather the most attractive in all this series.

SCRIBNER'S.

"SCRIBNER'S" naturally numbers itself among the special Christmas numbers, but it is comparatively modest in putting on a holiday dress, for the original cover is retained and two conventional trees with real green leaves are printed thereon in sign of the Christmas time.

There are several treats for special scholars in the number, notably a very valuable archæological article by Professor Allan Marquand, in which he tells of the search for the Della Robbia monuments in Italy. For the very "practical" man who may be inclined to cavil at such special labor there is a good answer in Professor Marquand's closing paragraph, in which he speaks of the value which these resurrected monuments have for our modern sculptors and decorators in suggesting the variety of uses to which terra cotta may be applied. Few people, probably, know that terra cotta, while far more economical as a material than marble, is exceedingly durable, standing the onslaughts of time and rain, and does not fade in the sunshine.

Even in this age of realism there will be plenty of followers of Andrew Lang and lovers of the Waverly novels who will appreciate the hitherto unpublished letters by Sir Walter Scott which appear in this number, prefaced by Mr. Lang's introduction. These letters were so unsuspected by antiquarian lovers of Sir Walter Scott that even Mr. Lang himself was fooled at first by the rare archaic spelling and general improbability of such a find.

A very charming feature is the prettily illustrated paper in which Mr. F. S. Church tells of "An Artist Among Animals"—of all men the best to write on such a theme. Mr. Church's strong contrasts of lovely girls and fierce wild beasts, and the fetching verisimilitude of his smaller birds and beasts, make these reminiscences of especial interest. Of his famous lions and tigers, he says:

"I paint the lioness much more than I do the lion. Probably few notice the difference, but I use the tigress in all my pictures in preference to the male. There is something in the female of the cat species particularly that appeals to me much more than the male. She has certain lines, movements, alertness and quickness of perception, with a sort of you-had-better-look-out expression, which I don't see in the male. I often think of that tigress I read of in a report of the London Zoo, who, accompanied by her two cubs, stealthily approached in the middle of the night a small temporary board shanty, where some native East Indian railroad workmen were sleeping. Leaving her cubs at the door, she stole in, grabbed one of the sleeping men and made off with him before the horrified occupants could realize the situation. Just think of the peculiar intelligence shown not only in her successful raid, but in her instructions to her cubs, whom she made wait outside for her while she did her terrible work!"

It certainly seems that there should be a field for a first-class magazine devoted especially to university matters, and an enthusiastic Princetonian, Dr. M. M. Miller, is aiming with much earnestness to occupy this field with the *University Review*, the third number of which comes to us dated December. The new monthly aims to cover both the more active serious discussions which come

up in the college world and also to give full attention to the intercollegiate sports of the day and to a qualifying strain of fiction and verse. The December number is largely taken up with the recent Cornell celebration, of which it gives the history, together with pictures of the Cornell authorities and some pretty half-tones of Ithacan scenery.

THE COSMOPOLITAN.

THIS number of the *Cosmopolitan* exploits fully the magazine's reputation for beautiful, clear, half-tone pictures, scores of which are devoted to World's Fair subjects. On the theme "After the World's Fair," the pens of such men as Paul Bourget, John J. Ingalls, F. Hopkinson Smith, Robert Grant, Arthur Sherburne Hardy and Walter Besant are enlisted, while even Mr. Howells' Altrurian traveler is lured into the prolix beauties and wonders of the White City.

Prof. Charles A. Young, of Princeton, tells in the department "The Progress of Science," of the very latest determination of the sun's distance from the earth.

"The work was very thoroughgoing, involving the co-operation of no less than twenty-one different observatories in determining with their meridian circles the places of the stars which were used as reference points along the planet's track. Then all through the summer the position of the planet itself, with reference to these stars, was assiduously observed by Gill and Auwers at the Cape of Good Hope; by Elkin and Hall at New Haven, and in Germany by Hartwig at Göttingen, and by Schur at Bamberg. The instruments employed in their observations were heliometers of the most perfect construction, and the measurements made with them rank among the most accurate and refined known in astronomy. Altogether, between June 15 and August 27, while the planet was near its opposition and for a time at a distance from the earth less than four-fifths the distance of the sun, over eight hundred complete sets of measures were secured, and only six nights were wholly missed.

"The reduction of this mass of material has occupied nearly three years, and the result has only just been published. Dr. Gill, who originated the campaign and has reduced the observations, finds for the parallax of the sun 8".809, corresponding to a distance of 92,800,000 miles; and he further finds that the hitherto accepted mass of the moon must be reduced somewhat more than one per cent. to satisfy the observations: in other words, the earth's monthly swing due to her motion around the common centre of gravity of earth and moon was found to be about one per cent. less than had been assumed."

M'CLURE'S MAGAZINE.

M'CLURE'S comes out for December in the gayest of Christmas covers of very green background, with very red trimmings. Arthur Warren interviews Archdeacon Farrar, and is told by the famous prelate:

"Well, I am at work at half-past eight in the morning. I have a large mail, as a rule, and when that is sifted and answered I work at one thing or another till ten in the evening. I do a good part of my task at the Athenæum Club in the afternoon. But, of course, the chief part of it is done in this study, and at this tall desk by the window. You have probably noticed that I prefer to stand while writing. An hour or two before bedtime I devote to reading. Besides, of course, as Chaplain to the Speaker, I am bound to regular attendance at the House of Commons."

The working hours of a very different celebrity are described by E. J. Edwards in his article on "Governor William McKinley." "If McKinley had been seen by the American people when he was engaged in acquiring and applying knowledge, he would have been discovered at his committee rooms sometimes eight or ten hours a day, or in consultation with his committee at his private rooms often until long past midnight. He would have been seen exploring the mysteries of chemistry; reading the reports of trade associations; sometimes with great volumes massed up before him, through which he searched with the penetrating industry of one who compiles history; and in addition to these duties was his occupation upon the floor of the House."

The wonderful adventures of the detective Sherlock Holmes are brought to a close in this number by Dr. Conan Doyle, who kills off his hero after one of the most stirring of his experiences.

THE CHAUTAUQUAN.

"VILLAGE Life in Ireland," by Prof. J. P. Mahaffy, of Trinity College, Dublin, forms the subject of the opening paper of the December issue. Beginning by asking if such a thing really exists in the Emerald Isle, the author goes on to consider the reasons for this condition, which he finds in the perfect safety of the country, and the almost infinitesimal division of the land among tenants. Untidiness and squalor, with their attendant misery and sadness, are habits of the people, but poverty is by no means always the cause. Social talent and tact, everywhere present, are the more remarkable for the environment. The *shebeen* or pot house is the curse of the land, and the controlling influence, too often misused by priest and landlord, is all that stands between the Irish peasantry and the loss of their virtues and social charm.

"The Study of Crime and Criminals," by Mr. J. B. Macdonald, is perhaps the most interesting in the "Required Reading." Since criminology has become a science, attention and study have been diverted from the crime to the criminal. Like other sciences, it has its divisions into general, special and practical departments, and it holds seven cardinal principles, which he enumerates. In relation to sociology, the criminal himself, not law books, must be minutely studied; his brain, where we are now almost completely at sea; his sensibility, which seems obtuse, whether moral or physical; his almost complete moral insensibility, his stupendous vanity and his power of deceit even in the face of the scaffold. The author thinks that the danger from criminal hypnotism has been exaggerated, and in conclusion, speaking of the remedies for crime, he takes an optimistic view. "The great majority are susceptible to reformation, or at least improvement. The remedy consists in religious, moral, intellectual and industrial training of children and youth."

M. Ferraris writes of "Italian Finances," finding two lasting and four occasional causes for the bankrupt condition of the country. The former consist in the successive economic crises since 1885 and the steady decline of the money market; the latter are found in the suspension of silver coinage in India and restrictive measures in the United States, the hostilities between France and Siam, the demand for the dissolution of the Latin Union, the new Italian banking laws. He attacks the policy of the late ministry and declares that the raising of the rate of discount, the control of the money market by the Treasury, and agrarian laws on a broad basis are the remedies for the present condition.

THE FRENCH REVIEWS.

THE REVUE DES DEUX MONDES.

THE *Revue des Deux Mondes* for the month of November opens with an historic article from an historic pen: a chapter of the history of the Princes de Condé, by Henri d'Orléans, Duc d'Aumale, their successor at Chantilly. This palace, almost totally destroyed at the Revolution, has been rebuilt in all its splendor, enriched with priceless memorials of the history of the Condés of France, and will fall into the possession of the French Academy on the death of its aged possessor, by virtue of his irrevocable deed of gift. The chapter printed in the *Revue* refers to intricate negotiations between Mazarin, Minister of the young King, Louis XIV, and the Crown of Spain, with which Condé (M. le Prince), cousin and rival of Louis, was involved. The quarrel is matter of common history; not so the intention of King Louis to get hold of Chantilly by confiscation. He went there, found himself *fort bien*—"extremely comfortable"—and said to his courtiers that he should include the palace in the treaty. The Duchess de Châtillon writes to Condé that she "hopes not to lose him as a neighbor." M. le Prince replies angrily that he should take the confiscation as an "awful affront." "It is quite false," says he, "that the King ever had a passion for the place. His Majesty never would halt there to see *him*, and if they made Louis go there it was purposely done to vex him,—Condé." "It is the only spot where I can go while I am out of court favor, and as I see no early chance of being resorted to that, the least I can claim is a pleasant place in which to pass the time of waiting." Fortunately Chantilly escaped confiscation; the young King contented himself with St. Germain and Versailles, then a hunting-box of Francis I. How Louis made it into the great palace he who runs can read; but the Sun King and his descendants have vanished, while the Duc d'Aumale still is at Chantilly writing the history of his race and on the best of terms with the French Republic.

"Spelling Reform," by M. Michel Breat, also of the Institute, touches on a very pretty quarrel in the French press, wherein the arguments *pro* and *con* seem to have been tossed about like shuttlecocks. Neither foreign students of French, brought up upon the older literature, nor the natives of conquered Tonquin, can be appealed to in favor of phonetic spelling. The cultivated student buys and treasures up old editions of the French classics, and enjoys the antique appearance of roy and foy. "What venerable editions do we not see cherished across our frontiers," remarks M. Michel Breat; and the aged Latin language survives in churches and universities and courts of law, beside her own modern daughters. He opines that if France wrote phonetically, and with any great modifications of the old spelling, her enemies would take it as a proof that she was crumbling to pieces. The complicated English language, which in orthography is, scientifically speaking, the worst of sinners, has been practically taught on all points of the globe to two hundred millions of men.

The last edition of the dictionary of the French Academy was revised in 1835, since when, "if we consider all the tributary themes which poetry, the drama, politics, science and popular slang have brought into the French language in sixty years, it is obvious that something more than a re-edited reprint is required."

THE NOUVELLE REVUE.

IN addition to M. Engerand's interesting account of mediæval watering places, noticed elsewhere, the *Nouvelle Revue* contains other articles of note. M. Perrens, of the French Institute, describes eloquently the life of a sixteenth century apostle of tolerance. The man thus styled was none other than Sebastian Castellion, the author of the celebrated dialogues which, published in 1542, became one of the literary successes of the century. Castellion, a Swiss by nationality, has been styled by one of his critics "the Protestant Fénelon." When the black death burst out in Geneva he remained in the town, although the pastors fled from the hospitals, and did his best to help the people. But notwithstanding the many proofs of moral and physical bravery which he gave to both his friends and enemies, M. Perrens' hero was publicly condemned by Calvin. With him, it seems, he only differed on two trifling points, of which the most important was as to what had been the precise spirit in which Solomon had written the Canticle of Canticles. Renan once declared that Castellion was the first to recognize the true character of these writings. Be that as it may, his quarrel with Calvin practically exiled him from Geneva, and he lived a quiet, retired life at Bâle with his wife and family, translating the Bible into Latin and French, and writing constantly in favor of tolerance and universal charity. But Calvin still continued to actively persecute "that infamous pest," "that dog." At last, worn out by the incessant struggle, Castellion was just preparing to go to take refuge in Poland when death surprised him on September 29, 1563, when he was only forty-eight years of age. Although none of his followers at Bâle had dared to defend him during his lifetime for fear of irritating Calvin, his death put the whole town, and especially the university, into mourning.

In the same number M. de Lassus begins what promises to be a remarkable addition to the social history of France, namely, a series of articles on the famous Hôtel de Bourgogne, and the origin of the Comédie Française. The Hôtel de Bourgogne, we are told, went through some curious phases, having been built in the reign of St. Louis by the King's brother, the Comte d'Artois, and some centuries passed before the Hôtel de Bourgogne became in any way associated with the theatre. The first plays acted there were Passion plays, which were acted for the benefit of a troupe who styled themselves Brothers of the Passion; but they soon had to make place for King Louis XIII's comedians, and it was there that ultimately the famous Italian company really taught the dramatic art to their French *confrères*.

M. Diamanti gives a delightful picture of Russian Turkestan and the Trans-Carpathian Railway, or rather that extension of it which penetrates into Turkestan. This Russian possession, by its geographical position, touches on China, Bokhara, and the north of Afghanistan and is in itself a land where will soon be established coal, tin, copper, gold, silver and lead mines, and should form an unexpected and much-needed addition to the wealth of Russia as a nation. If all that M. Diamanti says is true, Turkestan should form a valuable outlet for the Russian emigrant, for the land, he declares, could easily be made marvelously fertile by means of a system of canalization, and even now the cotton-growers of Turkestan are amassing year by year enormous wealth.

THE NEW BOOKS.

RECENT AMERICAN PUBLICATIONS.

ECONOMICS, POLITICS AND SOCIOLOGY.

Essays on Questions of the Day. Political and Social. By Goldwin Smith, D.C.L. 12mo, pp. 360. New York: Macmillan & Co. \$2.25.

Mr. Goldwin Smith is a writer whose discussion of every subject he touches is marked by originality of view and fascination of style. Several volumes from his pen have quite recently appeared from the press of Messrs. Macmillan & Co., and the latest is a volume of essays on questions of the day. These essays are largely drawn from articles contributed by Mr. Smith to leading periodicals. They are, however, revised and extended. The volume includes the following essays: Social and Industrial Revolution; The Question of Disestablishment; The Political Crisis in England; The Empire; Woman Suffrage; The Jewish Question; The Irish Question; Prohibition in Canada and the United States. As an appendix there is reprinted an article upon the Oneida Community and American Socialism, written by Mr. Smith some twenty years ago.

Essays and Studies. By Emile de Laveleye. First series. Paper, 12mo, pp. 412. Paris: Félix Alcan.

Many admirers of the late Emile de Laveleye, scattered through all the countries of the civilized world, will be glad to know that his very numerous miscellaneous writings are to be brought together in a series of volumes of essays and studies. The first series has now appeared and includes writings covering the period from 1861 to 1875. There are sixteen essays in the volume, and they deal with various educational, literary and political topics, with all of Professor Laveleye's characteristic ingenuity, scholarship and charm of style.

Principles of Political Economy. By J. Shield Nicholson, M.A. Octavo, pp. 465. New York: Macmillan & Co. \$3.

An important contribution to the literature of political economy has appeared from the pen of Professor J. S. Nicholson, who holds the chair of Political Economy in the University of Edinburgh. Volume I is now in the hands of the public. Professor Nicholson's work rests in the main upon the basis of Adam Smith and John Stuart Mill. He gives particular attention to history and affairs as illustrative of economic principles. The work is clearly and attractively written.

Principles of Economics: The Satisfaction of Human Wants, In So Far as Their Satisfaction Depends on Material Resources. By Grover Pease Osborne. 12mo, pp. 454. Cincinnati: Robert Clarke & Co. \$2.

Mr. Grover P. Osborne, of Cincinnati, presents the principles of economic science under a somewhat original, and certainly a very striking and important grouping of topics. He considers that economics should deal with the "satisfaction of human wants in so far as their satisfaction depends on material resources." His six main divisions or "books" treat of the following subjects: 1, The Resources for the Satisfaction of Wants; 2, Population—the Number of People Whose Wants are to be Satisfied; 3, Ownership and Control of the Resources for the Satisfaction of Wants; 4, Economical Uses of the Resources; 5, Exchange; 6, Distribution of Produced Wealth. Economic students and intelligent general readers will find this book a safe guide to the main doctrines of economic science.

The Distribution of Wealth. By John R. Commons. 12mo, pp. 258. New York: Macmillan & Co. \$1.25.

Professor John R. Commons, whose contributions to the REVIEW OF REVIEWS have familiarized the readers of this magazine with his insight, clearness and force as an economic writer, has made a positive and permanent addition to the theoretical literature of political economy in his new work, "The Distribution of Wealth." It is not a book for general readers, but it must give Dr. Commons a high standing among economic thinkers.

An Introduction to the Study of Political Economy. By Luigi Cossa. 12mo, pp. 597. New York: Macmillan & Co. \$2.60.

Professor Cossa, the Italian economist, has for years been recognized as the most studious of all the compilers of economic bibliography and biography. He enjoys a high reputation for his work on the Principles of Taxation, and has made

a very exceptional and valuable addition to economic literature in the present treatise. It supplies detailed information accessible in no other convenient form, and the English translation of it will be welcomed by all economic students in this country. It is very much fuller than the early editions of his introductory work.

Essays in Political Economy. By Michael Corcoran. Paper, 12mo, pp. 108. Omaha, Neb.: Published by the Author. 25 cents.

Mr. Michael Corcoran, of Omaha, Neb., has published in pamphlet form certain essays in economic science, which are dedicated to Cardinal Gibbons. The esteemed Cardinal, in accepting the dedication, commends Mr. Corcoran's efforts in behalf of the laboring classes.

Politics in a Democracy. By Daniel Greenleaf Thompson. 12mo, pp. 176. New York: Longmans, Green & Co. \$1.25.

Mr. Thompson is a well known member of the New York bar, an original thinker, and an author of some repute. This little volume, which upon its face would appear to be a theoretical dissertation upon the science of politics, passes, after an introductory essay or two upon monarchy, democracy and so on,—into an elaborate defense of Tammany Hall. Practically the entire body of the book is taken up with an argument for what the author calls the modern development of the government of cities "by syndicate." He holds that all great modern cities are falling under a type of government of which Tammany is the best instance. Unfortunately he does not cite the other cities which are in this condition, and he has built a superstructure of political philosophy upon no basis whatever. The book contains much shrewd dissertation and much high sentiment, mingled with large proportions of sophistry.

The Mark in Europe and America. By Enoch A. Bryan, A.M. 12mo, pp. 170. Boston: Ginn & Co. \$1.10.

President Bryan, of Vincennes University, while studying history and economics at Harvard, entered upon an examination of the so-called mark theory of the origin of Teutonic village life, and property in land. He succeeds in throwing very considerable discredit upon a doctrine which has had great influence both in the study of early institutions and in the propaganda of land reform.

Chances of Success: Episodes and Observations in the Life of a Busy Man. By Erastus Wiman. 12mo, pp. 367. New York: The American News Company.

Mr. Erastus Wiman is a man whose energy and great capacity have made him one of the most influential men of affairs of this generation. His influence and personal force have been felt in every portion of the English-speaking world. So strong is his personality that it is wholly agreeable to find in this new book of his a half-veiled hint of autobiography from beginning to end. The sub-title is explanatory of the character of the book—"Episodes and Observations in the Life of a Busy Man." Each chapter is complete in itself, and most of them fill only a page or two. Mr. Wiman's knowledge of the business world is greater than that of any other man with whom we are acquainted, and his fund of human sympathy is broad and unfeeling. The book is full of interesting anecdotes, sound business maxims, broad and trenchant views upon economic and social questions, and the cheering optimism of a man who believes in his fellow-men and permits nothing to dishearten him.

The Housing of the Poor in American Cities. By Marcus T. Reynolds, Ph.S., M.A. Paper, 8vo, pp. 132. Baltimore: American Economic Association. \$1.

Very timely in view of the pressing practical problems that concern all our largest towns, is an essay on the housing of the poor in American cities, by Marcus T. Reynolds. Mr. Reynolds won the prize offered by the American Economic Association for the best monograph on this subject. His bibliographical references are valuable, and he has compiled much pertinent information.

Women Wage-Earners: Their Past, Their Present and Their Future. By Helen Campbell. 12mo, pp. 325. Boston: Robert Brothers. \$1.

Mrs. Helen Campbell is the most indefatigable and doubt-

less the best informed of all the American students of the question of woman as a factor in the modern industrial system. Her present contribution to this subject is a useful addition to economic literature and to the practical discussion of a topic of current moment.

Public Assistance of the Poor in France. By Emily Greene Balch, A.B. Paper, 8vo, pp. 179. Baltimore: American Economic Association. \$1.

Another valuable publication issued by the American Economic Association is entitled "Public Assistance of the Poor in France." This monograph is practically historical. It has, however, much information that gives it value to the practical reformer.

Local Government in the South and the Southwest. By Professor Edward Bemis, Ph.D. Paper, 8vo, pp. 118. Baltimore: The Johns Hopkins Press. \$1.

An exceptionally valuable contribution to political science is the latest publication in the Johns Hopkins University studies. It is entitled "Local Government in the South and the Southwest," and has been prepared by Professor Edward W. Bemis, lately of the Vanderbilt University, now of the University of Chicago, with the co-operation of his Vanderbilt University students. It informs us concerning the existing systems of local administration in twelve Southern States. The tendency, as pointed out by Professor Bemis, is decidedly towards the development of self-government. Bound up with the foregoing monograph is an interesting study upon the Popular Election of United States Senators, by Mr. John Haynes, a graduate of the Johns Hopkins University.

A Colony of Mercy; or, Social Christianity at Work. By Julie Sutter. Octavo, pp. 364. New York: Dodd, Mead & Co. \$2.

The picture of "Social Christianity at Work," which we have presented in these pages, has a value for the student of social problems in general, and a considerable, perhaps larger, value for those interested in philanthropy with a direct religious purpose. In a certain colony in Germany called "Bethel," which has been in existence for about a quarter of a century, the author found a "vision of a programme of Christianity realized." She has related with great enthusiasm the work that is being done at this privately-managed institution, or group of institutions, for the epileptic, the drunkard, the laborer out of employment and the needy of all classes who are willing to work. Under the direction of Pastor von Bodelschwingh's ability and zeal this institution in Westphalia has extended its usefulness even to Africa, and has had a large influence upon other labor colonies in Germany. Of these and of the provisions made in various ways for "Darkest Germany Tramping," our author has given us interesting though fragmentary information. It is a curious fact that by means of stations where a man is allowed to earn his living an unemployed laborer "can travel through the length and breadth of the Empire *without having one penny in his pocket*." The chapter upon "The Workman's Home" is possibly the one of widest general interest. With the text go twenty-two relevant illustrations and a plan of the colony in its various subdivisions.

Resources and Development of Mexico. By Hubert Howe Bancroft. Octavo, pp. 337. San Francisco: The Bancroft Company.

Mr. Hubert Howe Bancroft's new volume on Mexico is devoted principally to a question of the actual condition of the country as regards natural resources, mines, agriculture, stock raising, communication, manufactures, commerce, etc. The book is highly optimistic in tone, and is apparently written with a view to attracting attention to Mexico as a field for the investment of capital or a desirable home for enterprising emigrants.

World's Congress of Bankers and Financiers. Octavo, pp. 615. Chicago: Rand, McNally & Co.

Numerous volumes are making their appearance as a result of the World's Congresses at Chicago. A very useful one has been edited by the well-known Chicago banker, Mr. Lyman J. Gage, entitled the "World's Congress of Bankers and Financiers." It contains important addresses upon financial topics, and will preserve in permanent form much that will have value for purposes of reference.

Addresses Delivered before the World's Railway Commerce Congress. Official Report. Octavo, pp. 270. Chicago: The Railway Age. \$3.

The Railway Age, of Chicago, has published in a valuable volume a report of the addresses delivered before the World's Railway Commerce Congress, held at Chicago in June, under the auspices of the World's Fair Auxiliary. This congress

commanded superior ability, and the volume will be in demand as a distinct addition to the literature of railway operation and economics.

Conversations Between the Rabbi of the Boarding House and a Company of Intelligent Ladies and Gentlemen. By Hon. H. H. Young. 12mo, pp. 371. St. Paul, Minn.: B. Ramaley & Son.

Mr. H. H. Young, a well-known citizen of St. Paul, and for a long time an official of the State of Minnesota, has under the above-named title prepared a series of papers discussing a great variety of current questions. His discussions take the form of dialogues in a boarding house family, somewhat after the fashion set by Oliver Wendell Holmes in his Breakfast Table books.

A Cityless and Countryless World: An Outline of Practical and Co-operative Individualism. By Henry Olerich. 12mo, pp. 447. Holstein, Iowa: Gilmore & Olerich.

Mr. Olerich's book is another contribution to the already very extensive library of Utopias. He pictures an ideal society in which development of mind and character has reached such a point as to make what he calls co-operative individualism suffice for everything, and in which all social and political institutions are done away with.

Police and Prison Cyclopædia. By George W. Hale. Revised edition. Octavo, pp. 810. Boston: H. O. Houghton & Co.

The new edition of Mr. George W. Hale's Police and Prison Cyclopædia is worthy of commendation. It serves a variety of purposes. It concludes with an interesting biographical sketch of the author and compiler, who is now a member of the police department of Lawrence, Mass. There follows a treatise on police officers and their duties, including a definition of criminal terms and other cognate information. The body of the book is devoted to lists of the prisons of the United States with a vast collection of prison statistics, and of the police departments of all towns having ten thousand people or more. Finally, there is an extensive report upon the prisons and police departments of foreign countries, with abundant statistics and a variety of miscellaneous material falling under the general head of criminology. The book will be gratefully welcomed by many who will have occasion to draw upon it for information otherwise almost absolutely inaccessible.

HISTORY AND BIOGRAPHY.

William Jay and the Constitutional Movement for the Abolition of Slavery. By Bayard Tuckerman. Octavo, pp. 205. New York: Dodd, Mead & Co. \$2.50.

William Jay was the second son of the first Chief Justice of the United States, and was a distinguished philanthropist who bore a leading and influential part in the anti-slavery movement. He was also very prominent in behalf of the cause of international peace, and his career is worthy of a full biography. Meanwhile, Mr. Tuckerman's work, devoted chiefly, however, to William Jay's services in the constitutional movement for the abolition of slavery, is a valuable contribution to American history and biography.

History of Slavery in Connecticut. By Bernard C. Stiner, Ph.D. Paper, 8vo, pp. 84. Baltimore: Johns Hopkins Press. 75 cents.

Among the recent publications of the Johns Hopkins University there should be mentioned Dr. Bernard C. Stiner's "History of Slavery in Connecticut," a thorough and elaborate study from original sources.

The Making of Virginia and the Middle Colonies, 1578-1701. By Samuel Adams Drake. 12mo, pp. 238. New York: Charles Scribner's Sons. \$1.50.

"The Making of Virginia and the Middle Colonies" is a very attractive companion volume to Mr. Drake's "Making of New England" and "Making of the Great West." It should find a place in the schools of New York, Pennsylvania, Delaware, Maryland and Virginia. It has many pictures, and is a clear and accurate narrative.

A First History of France. By Louise Creighton. 16mo, pp. 321. New York: Longmans, Green & Co. \$1.25.

Miss Louise Creighton, whose first history of England is so well known, has now successfully attempted to cover the whole course of French history in a small volume suitable for use in schools or for the reading of young people at home. It is to be heartily commended.

Henry of Navarre and the Huguenots in France. By P. F. Willert, M.A. 12mo, pp. 483. New York: G. P. Putnam's Sons. \$1.50.

Mr. P. F. Willert, of Exeter College, Oxford, has given us a very brilliant and readable book on Henry of Navarre and the French Huguenots. It is at once scholarly and attractive. It is the latest issue in the "Heroes of the Nations" series.

A Friend of the Queen (Marie Antoinette—Count de Fersen). By Paul Gaulot. 12mo, pp. 383. New York: D. Appleton & Co. \$2.

The Count de Fersen, the "friend," whose history we have given in the pages of this translation, was a Swedish nobleman, who in his boyhood days met Marie Antoinette at the French Court, and remained in a more or less close intimacy with her until the fatal days of the Revolution. M. Gaulot has based his narrative upon recently discovered or recently published documents and believes that the view of the French Queen given therein is valuable and more accurate than it is customary to present. Count de Fersen served as an aide-de-camp to Rochambeau in our American Revolution, and after honors from his native Sweden was torn to pieces by an angry mob of his countrymen in Stockholm in 1810. This pleasantly written and unstrained record throws considerable light on the events and people prominent in France and other countries near the close of the eighteenth century. There are portraits of the Queen and her friend. The translation has been made by Mrs. Cashee Hoey.

Two German Giants: Frederic the Great and Bismarck. By John Lord, D.D., LL.D. 12mo, pp. 173. New York: Fords, Howard & Hulbert. \$1.

Dr John Lord, well known as a popular expositor of history, has prepared two useful essays, one on Frederic the Great, the other on Prince Bismarck. The publishers have bound together with these a character sketch of Bismarck by Bayard Taylor, written some twenty years ago, and Bismarck's speech before the Reichstag in 1888.

General Thomas. By Henry Coppée, LL.D. "Great Commanders" series. 12mo, pp. 343. New York: D. Appleton & Co. \$1.50.

The latest volume in the "Great Commanders" series is Prof. Henry Coppée's life of General Thomas. George H. Thomas was one of the bravest and ablest of the generals on the Union side in the late war, and this book is the first adequate account of his life and services.

History of the Scandinavians and Successful Scandinavians in the United States. Compiled and edited by O. N. Nelson. 12mo, pp. 643. Minneapolis, Minn.: Published by the Author.

A book the value of which will be better appreciated fifty years from now than it can be to-day is Mr. O. N. Nelson's "History of the Scandinavians in the United States," together with a series of brief biographical sketches of successful American Scandinavians. The volume gives faithful accounts of the beginning of the different settlements of Swedes, Norwegians and Danes in the United States, and supplies historical data which, but for the author's studious labors and those of his associates in the compilation of this book, might have become irreparably lost. Mr Nelson has been ably assisted by a number of the foremost Scandinavians of the Northwest.

ART, BELLES-LETTRES AND THE HISTORY OF LITERATURE.

Greek Lines, and Other Architectural Essays. By Henry Van Brunt. 12mo, pp. 274. Boston: Houghton, Mifflin & Co. \$1.50.

The author of these essays has had an active professional experience in architecture for more than thirty years, and his pages show him to have also a high conception of architecture as an art. The chapters are partly historical and partly critical, and so arranged as to form a sequence. The essay upon "The Royal Chateau of Blois, an Example of Architectural Evidence in the History of Civilization" is quite fully illustrated, and the chapters upon the "The Present State of Architecture," "Architecture and Poetry," with other chapters, are timely and of interest to many readers who are not directly engaged in the building art—in fact, to all serious students of modern aesthetic tendencies.

The Brontës in Ireland; or, Facts Stranger than Fiction. By Dr. William Wright. 12mo, pp. 326. New York: D. Appleton & Co. \$1.50.

The details of Dr. Wright's account have been gleaned at first hand from original documents and from people who per-

sonally knew the Brontës. The history of the Irish branch of that family of genius seems never to have been thoroughly investigated heretofore, and lovers of "Jane Eyre," "Wuthering Heights," etc., as well as all who are interested in the ramifications of English literary history will be very glad to obtain the results of Dr. Wright's investigations. His pages are easy reading and are enlivened by a number of diagrams and illustrations. The author has deemed his results of such a nature as to warrant the sub-title "Facts Stranger than Fiction."

Goethe Reviewed after Sixty Years. By J. R. Seeley. 12mo, pp. 169. Boston: Roberts Brothers. \$1.

The author of "Ecce Homo" has brought together a number of essays along various lines of Goethe criticism, some of which have been previously printed. In spite of the number of works about the great German author, the view of his genius and personality which we find in these chapters upon "Some Limitations of His Genius," "Literary Phases of Goethe," "Wilhelm Meister," "Another Religion," etc., seems to be fresh and stimulating. There is an excellent portrait of Goethe after a painting by Stieler.

The English Religious Drama. By Katharine Lee Bates. 12mo, pp. 254. New York: Macmillan & Co. \$1.50.

These essays upon "Passion Plays," "Saint Plays," "Miracle Plays" in various aspects and "Moralities," embody lectures given by Professor Bates in a summer school at Colorado Springs last July. They convey a good deal of information and have something of the character of text-book work, but are popular and fresh enough to deserve place among literary studies proper. The English religious drama is a subject in which ordinary readers are not very proficient, but it is of great importance to any one really desirous of understanding the history of the English stage and of the Anglo-Saxon dramatic spirit.

The Beginnings of the English Romantic Movement; A Study in Eighteenth Century Literature. By William Lyon Phelps. 12mo, pp. 200. Boston: Ginn & Co. \$1.10.

Professor Phelps has done a real service to all earnest students of literature in working up with enterprise and faithfulness the subject of the origin of the romantic movement back in the forty years between 1725 and 1765. In order to comprehend clearly our nineteenth century developments it is necessary to examine their origin, and it seems rather strange that Mr. Phelps found no work published which discusses in detail the exact period and the exact topic which he has investigated. Like Professor Bates' volume, Mr. Phelps' study could be well placed among educational books, but is also adapted for general reading by students of literature. It is the result of genuine research.

The Near and the Heavenly Horizons. By the Countess de Gasparin. 16mo, pp. 311. New York: A. D. F. Randolph & Co. \$1.

The general tone of the Countess de Gasparin's writing may be deduced from a quotation out of her introduction: "There is nothing here for utilitarians, nothing for so-called realists, for lovers of the dramatic, for acute connoisseurs; nothing, indeed, I believe, for any but me and those like me—dreamers, satisfied with little, whom a poem scares, but a flower half opened, a holiday bee, a rustic outline, can throw into infinite reverie." In the "Near Horizons" we have short sketches in an idyllic, reflectively-religious style, of peasant life in Southern Europe, or in a few cases in burdened Paris, with the pathetic element predominating. The matter in the "Heavenly Horizons" is more directly religious and somewhat more systematic. The book might perhaps be called a collection of religious musings controlled by a literary temperament and lacking an Anglo-Saxon vigor, but excellent in certain other qualities.

Saskia, the Wife of Rembrandt. By Charles Knowles Bolton. Octavo, pp. 133. New York: Thomas Y. Crowell & Co. \$1.50.

Mr. Bolton's pages give us scant but entertaining glimpses of the home life of the great Dutch painter, who was eminently of a domestic nature, and of the part which his wife plays in his paintings. A number of portraits of Saskia and other illustrations are given, and Mr. Bolton has added bibliographical notes and other relevant matter.

Boswell's Life of Johnson. Edited, with an introduction, by Mowbray Morris. Two vols., 12mo, pp. 606-607. New York: Thomas Y. Crowell & Co. \$2.

Messrs. Thomas Y. Crowell & Co. place in their "Standard Library" a handsome two-volume edition of Boswell's

"Life of Johnson." The edition is, in substance, a reprint from the British one edited by Mowbray Morris, with some notes added, and with the letters of Dr. Johnson and his friends retaining the original quaint and peculiar spelling. The frontispieces are portraits of the biographer and his famous hero. For general library use the edition appears to be very desirable; it certainly is attractive in appearance.

Our Village. By Mary Russell Mitford. 32mo, pp. 348. New York: Charles L. Webster & Co. 60 cents.

The idyllic side of English village life has a charm for very many readers, and no better embodiment of it is found than in the classical and popular sketches of "Our Village." Messrs. Charles L. Webster & Co. furnish lovers of literature with a convenient and neat little edition of Miss Mitford's principal work.

The English Humorists of the Eighteenth Century. By William Makepeace Thackeray. 16mo, pp. 266. Chicago: A. C. McClurg & Co. \$1.

Sartor Resartus: The Life and Opinions of Herr Teufelsdröckh. By Thomas Carlyle. 16mo, pp. 301. Chicago: A. C. McClurg & Co. \$1.

These two classics are published in small, convenient volumes and in the same general style, though the larger amount of matter in Carlyle's work requires a somewhat smaller type than is used in "The English Humorists."

NOVELS AND ROMANCES.

None Such? There Will Yet Be Thousands. By Emory J. Haynes. 12mo, pp. 331. Boston: The North Publishing Co. \$1.25.

Doctor Emory J. Haynes, a clergyman who has been called the "business man's preacher," has written a story which as a piece of genuine, unmistakably American fiction deserves high place, and as a study of certain contemporary social conditions is among the most prominent productions of 1893. The chief character of the story is an ex-governor of one of the New England States who has reached his four-score years and is burdened with the question, "How shall I best dispose of my rightfully accumulated \$35,000,000?" It can be said with safety that this Governor Randall is one of the most real personages of present day fiction, and a strikingly true type of the better class of our millionaires—"touchy," gruff at times, at others tender as a child, faithful to old friends, a severe and unmerciful opponent in the stock markets, reaping almost no benefit so far as happiness goes from his own wealth; to one who knows how to "get at him" a true and simple nature. Denman Thompson, of the famous "Old Homestead," likes the essentially dramatic treatment of the story—finds in it the germs of a great play—and believes that "time will find Dr. Haynes' Randall kept, referred to and valued as Mrs. Stowe's Uncle Tom is, or—as I believe—Uncle Josh will be." The aged but shrewd money king is besieged by college presidents and other typical beggars, but finally disposes of his property in a rather novel way. He leaves it in the hands of a sub-hero of the tale and the heroine, to be distributed in small sums—say of a few hundred dollars even—to worthy and struggling young people; especially those who might by a timely assistance create and foster a home life. There are numerous other strongly drawn personages in the book, including a very rascally judge; there is a description of a private car, an account of a meeting of laboring men, a scrimmage or two, etc., etc., but the purpose of the volume lies in this predicament of the wealthy Yankee and the manner of its solution. There is nothing here to satisfy an over-refined æsthetic taste; nothing to satiate an appetite for the morbid or the mysterious; there is a straight-forward humorous, convincing—i.e., realistic—American, nineteenth century story which has been highly entertaining to many prominent business men; a story of which Doctor Edward E. Hale writes: "I have more than once planned a book of the same purpose, but I am glad Dr. Haynes has done it instead of me, for I think it better done." The title may now be interpreted to mean: Are there "none such" as Governor Randall? "There will yet be thousands."

Sustained Honor: A Story of the War of 1812. By John R. Musick. 12mo, pp. 463. New York: Funk & Wagnalls Co. \$1.50.

The last three volumes of Mr. Musick's extended series of "Columbian Historical Novels" are devoted, respectively, to the War of 1812, the Mexican War and the Civil War; that is to say, Mr. Musick has made these events the central thread of his stories. Volume Ten, which has just come to our desk, is entitled "Sustained Honor," under which phrase Mr. Musick designates the success of the war spirit over the sectional peace-party spirit which manifested itself in New England during what is frequently called the Second War of Inde-

pendence. As in previous issues from Mr. Musick's pen we have historic events and romantic episode woven together. The author has related the causes of the war, as well as the progress of its battles and of popular sentiment at the time. There is the usual number of illustrations.

Pan Michael: An Historical Novel of Poland, the Ukraine and Turkey. By Henryk Sienkiewicz. 12mo, pp. 543. Boston: Little, Brown & Co. \$2.

Sienkiewicz is now widely recognized as the greatest of living historical romancers, with probably no rival in this century except Dumas. He has recently given us a novel of modern life and a volume of short stories, but in "Pan Michael" he returns to the particular field in which he is a master. This novel of the seventeenth century is a sequel to "Fire and Sword," and with that book and "The Deluge" completes a trilogy which is a delight to all lovers of stirring, adventurous fiction. The translation from the Polish has been made by Jeremiah Curtin.

A Gentleman of France: Being the Memoirs of Gaston de Bonne, Sieur de Marsac. By Stanley J. Weyman. 12mo, pp. 418. New York: Longmans, Green & Co. \$1.25.

Another historical romance with plenty of flash and fire comes from the pen of Stanley Weyman, the author of the highly praised "The House of the Wolf." "A Gentleman of France" is a story of the time of Henry of Navarre, of whose reign we have a historical view in a book noticed elsewhere in this department. Mr. Weyman's tale gives us insight into the turbulent public times in which the scenes are laid, but our interest is mainly centred in the stirring and lively experiences of the hero and his immediate friends.

Seven Xmas Eves: Being the Romance of a Social Evolution. By Clo Graves and others. 12mo, pp. 264. Philadelphia: J. B. Lippincott Co. \$1.

The unique idea of producing a novel in chapters contributed by separate authors seems well carried out in this volume, which is sub-headed "The Romance of a Social Evolution," and has the name of seven English authors on the title page. We trace with real interest the history of the hero and heroine, "Nick" and "Nan," from the time when we are introduced to them by "Mrs. Mary Cheevers," washerwoman, until "Nick" reaches—and deservedly—the position of member of Parliament. Each chapter is supposed to be told by some person who came into close relations with the characters of the story. The fitting illustrations are by Dudley Hardy.

A Spinster's Leaflets. By Alyn Yates Keith. Octavo, pp. 137. Boston: Lee & Shepard \$1.25.

Alyn Yates Keith's quiet but interesting story of New England life—at least, the atmosphere of the story seems to be that of Yankee land—is reprinted from the columns of the *New York Evening Post*. The plot is entertaining and the characters are well drawn. This spinster, as we believe is common with good-natured spinsters, takes a lively interest in some young people's matrimonial affairs, and watches until as successful an outcome is reached as our imperfect world allows.

A Coign of Vantage. By John Seymour Wood. 12mo, pp. 264. New York: Dodd, Mead & Co. \$1.

Some of "John Seymour Wood's" stories have been in an apparently pessimistic vein, but "A Coign of Vantage" is, on the contrary, very bright and amusing. It belongs to that large class of stories dealing with Americans abroad, and brings together in Switzerland a group of people from various parts of the United States.

A Daughter of this World. By Fletcher Battershall. 12mo, pp. 382. New York: Dodd, Mead & Co. \$1.25.

It strikes us that some of the characters and situations in "A Daughter of this World" are rather too romantic for current taste, but there is no question as to the general interest of the novel. It is an American story of our own time and centers to some extent about the old question of art versus love in a woman's heart. The personages who play a part in this drama—tragic, though with happy termination—are drawn with marvelous distinctness.

In the Dwellings of Silence: A Romance of Russia. By Walker Kennedy. 12mo, pp. 283. New York: Dodd, Mead & Co. \$1.

Adventurous rescues, flights and pursuits abound in the pages of this romance. The main characters are some Russian people of high standing who are thrown into exile and some Americans who encompass their deliverance. There may be an element of "purpose" in the tale, but in the main it seems told for its own sake.

Namesakes: The Story of a Secret. By Evelyn Everett-Green, 12mo, pp. 411. New York: Fleming H. Revell Co.

We have referred more than once to the "Oak Leaf Series," issued by the Fleming H. Revell Co. The novels of the series furnish one with excellent stories that are moral in bearing, without belonging to what is frequently called a "Sunday-School type." "Namesakes" is a vivacious English story with a plot of sufficient intricacy to excite our curiosity and enough play of character to repay one who reads for improvement. It has a number of whole-page illustrations.

A Latter Day Saint. By Mrs. Alfred Almond McKay. 12mo, pp. 279. New York: Fleming H. Revell Co. \$1.50.

"A Latter Day Saint" is pronouncedly romantic in tendency, though it deals with familiar enough people of our own day, and it is decidedly religious in tone.

The Bailiff of Tewksbury. By S. E. D. Phelps and Leigh North. 16mo, pp. 199. Chicago: A. C. McClurg & Co. \$1.

The pens of our two authors carry the reader back into merry old England and relate a tale of the days and haunts of Shakespeare; the dramatist himself appears, although he is not the principal character. The illustrations preserve the old-time atmosphere.

The Lost Canyon of the Toltecs: An Account of Strange Adventures in Central America. By Charles Sumner Seeley. 12mo, pp. 275. Chicago: A. C. McClurg & Co. \$1.

The scenes of Mr. Seeley's story of adventure are laid in some out of the way corners of the Isthmus of Panama. The pages are exciting in a wholesome way and offer us many a picture of scenery and native customs in Central America.

Pomona: By the author of "Miss Toosey's Mission." 12mo, pp. 296. Boston: Roberts Brothers. \$1.

For the Fourth Time of Asking. By the author of "Miss Toosey's Mission." 16mo, pp. 90. Boston: Roberts Brothers. 50 cents.

Roberts' Brothers send us two stories by the author of "Miss Toosey's Mission," etc. "Pomona" is a live and healthy English story, particularly for girls who are nearly women, with a plot having enough complexity to make the reader desirous of learning its solution. The other story is a slight amusing sketch, with more than a touch of pathos, about two aged lovers.

SHORT STORIES AND SKETCHES.

The Delectable Duchy: Stories, Studies and Sketches. By "Q." 12mo, pp. 328. New York: Macmillan & Co. \$1.

Cornwall seems to rival Brittany and our own New England as a corner of the world which readily furnishes entertaining types of the human species. The material of Mr. W. Quiller Couch's ("Q.") short stories, studies and sketches in his new volume is mainly drawn from this Southwestern nook of England. "Q." has a keen eye for the humorous and pathetic and a ready pen. He draws his characters with a discriminating human sympathy, and it seems to us that "The Delectable Duchy" is one of the very best collections of its kind which one could ask for. Many of the pages have the typographical marks arranged to indicate the Cornish dialect.

Mademoiselle Miss, and Other Stories. By Henry Harland (Sidney Lusk). 12mo, pp. 192. New York: Lovell, Coryell & Co.

"Mademoiselle Miss" is the first in the collection of five stories, it and the second dealing with Bohemian artist life in the Latin Quarter of Paris. All of the chapters are in a light vein, hardly deep enough, perhaps, to be called cynical, and showing rather more of the trivial than of the moral side of life.

Prisoners of the Earth, and Other Stories. By H. D. Lowry. 12mo, pp. 248. New York: Dodd, Mead & Co. \$1.

Most of the two score or so stories in this volume are reprinted from the (English) *National Observer*; they are good tales of various aspects of the life of common people in

Cornwall, and told quite largely in dialect. Perhaps there is a little overstraining of the pathetic.

A Daring Experiment, and Other Stories. By Lillie Devereux Blake. 12mo, pp. 360. New York: Lovell, Coryell & Co. \$1.

A volume of short stories varying in tone from those which culminate in a dark catastrophe to others which we leave with a smile. They relate to American life in the neighborhood of the Hudson for the most part, and are told in a clear, straightforward style.

From Wisdom Court. By Henry Seton Merriman and Stephen G. Tallentyre. 12mo, pp. 208. New York: Dodd, Mead & Co. \$1.50.

The confines of London furnish us with these humorous suggestions "On Visitors," "On the Sea," "On Love," "On Honour and Glory," and many other topics. Beneath a light and confiding style there is the basis of a sensible philosophy of life. The pages have many illustrations by E. Courbin.

The First Supper, and Other Episodes. By Jonathan Sturges. 12mo, pp. 176. New York: Dodd, Mead & Co. \$1.25.

Keynotes. By George Egerton. 12mo, pp. 192. Boston: Roberts Brothers. \$1.

OLD FAVORITES IN FICTION.

The Waverly Novels. By Sir Walter Scott. International Limited Edition. With Introductory Essays and Notes by Andrew Lang. Vols. XX, XXI, "The Abbot." Octavo, illustrated. Boston: Estes & Lauriat. \$2.50 each volume.

Volumes twenty and twenty-one of the "International Limited Edition" of Scott, to which we have already called frequent attention, are devoted to "The Abbot." This romance, though not the supremest of the "Waverly Novels," has, as Mr. Lang affirms in his editorial introduction, "qualities as great as the best." As in previous volumes of the edition, the illustrations are up to a high standard and constitute a main attraction. We have photo-etchings of Melrose Abbey and of Mary Stuart, together with ten other etchings from drawings by eminent artists.

The Village Rector. By Honoré de Balzac. 12mo, pp. 346. Boston: Roberts Brothers. \$1.50.

Miss Wormeley proceeds bravely with her praiseworthy undertaking of giving to the English-reading public that world in itself known as the "Comédie Humaine." "Le Curé de la Campagne," which she has translated under the title "The Village Rector," belongs to the little group of three novels which Balzac denominated studies of country life, and was written in 1837. It is a strong work, in which the depths of human sin and the nobility of human forgiveness are laid bare.

Rumour. By Elizabeth Sheppard. With an introduction and notes by Harriet Prescott Spofford. Two vols., 16mo, pp. 344-346. Chicago: A. C. McClurg & Co. \$2.50.

"Rumour" is not the greatest of Miss Sheppard's novels, but the many admirers of "Charles Auchester" and "Counterparts" will undoubtedly be desirous of placing it beside its somewhat more important fellows. Those who wish to acquaint themselves with the novelist's personality and style as explained by a strong admirer of Miss Sheppard will do well to read the brief introductory note by Harriet Prescott Spofford prefixed to "Rumour." Beethoven and Louis Napoleon are prominent figures in the romance and their portraits serve as a frontispiece to the two volumes. Messrs. A. C. McClurg & Co. have done a favor to a large public in preparing this attractive and convenient edition.

Picciola, the Prisoner of Fenestrella; or, Captivity Captive. By X. B. Saintine. Octavo, pp. 228. New York: D. Appleton & Co. \$1.50.

Most school children know the anecdotal germ of the story of the "Prisoner of Fenestrella" and the flower which brought him back to belief, love of life and happiness. Saintine's romance of the days of Napoleon—French to the core and recalling the flavor of "Paul et Virginie"—is given to the public by D. Appleton & Co. in a handsomely bound and well-printed edition with numerous illustrations by J. F. Gueldry.

The Adventures of Mr. Verdant Green, an Oxford Freshman. By Cuthbert Bede, B.A. Two vols., 12mo, pp. 500.

Little Mr. Bouncer and his Friend Verdant Green ; also, Tales of College Life. By Cuthbert Bede. 12mo, pp. 307. Boston : Little, Brown & Co. The three volumes \$5.

Almost at the opposite pole from "Picciola" are the humorous stories of Oxford life, which have been popular since Cuthbert Bede gave them to the world some forty years ago. Messrs. Little, Brown & Co. offer in several different styles of binding, a set of three volumes. Each volume has an etched title and frontispiece, and the text is made still more fun-provoking by a large number of illustrations by the author. The edition is a handsome one and will prove acceptable to those who love the flavor of English University life in the old coaching days—that species of life which included rather more rowing, boxing, cricketing, flirting, dining and getting into scrapes than it did of studying.

POETRY.

The Divine Comedy of Dante Alighieri. Translated by Thomas William Parsons. 12mo, pp. 372. Boston : Houghton, Mifflin & Co. \$1.50.

It was in 1843 that Dr. Thomas William Parsons published in Boston a little pamphlet which contained a translation into English verse of the first ten cantos of Dante's *Inferno*. From that time to his death, in 1892, the poet was a devoted student of the great Italian, and little by little, in the scrupulous method of one whose task is done for the love of art, he extended the translation. So conscientious was his work that even after a half century, in this volume which remains as the legacy of Mr. Parsons to the Dante admiring world, we have but a fragment of the *Paradise*, and an incomplete rendering of the *Purgatory*. Miss Louise Imogen Guiney writes a brief memorial sketch, and the preface is contributed by Professor Charles Eliot Norton. Professor Norton, while declaring that Mr. Parsons' translations have the tone and style of the translator, not of Dante, nevertheless asserts that these lines, so far as they go, have no superiors as a rhymed English version of the *Divine Comedy*. Mr. Parsons was something of a recluse as regards the world at large, and his name is not a very familiar one among the average American reading classes, yet he undoubtedly deserves a high place among our poets for the quality, if not for the quantity, of his work, and for his life-long sympathy with the spirit of the great mediæval epic.

Proverbs in Porcelain ; to which is added "Au Revoir," a Dramatic Vignette. By Austin Dobson. Octavo, pp. 112. New York : Dodd, Mead & Co. \$2.

A new edition of Mr. Dobson's old-time-flavor "Proverbs in Porcelain," together with "Au Revoir, a Dramatic Vignette," is among the most charming reissues of the holiday season. As to the two dozen or so full-page illustrations which interpret the rhymes, we only need to emphasize the second sentence in this quotation from Mr. Dobson's prefatory note: "I confess that I felt some misgiving whether these miniature studies, so frail in structure, so slight in substance, would lend themselves readily to pictorial embodiment. But this was clearly to reckon without the vitalizing power of Art and the accomplished pencil of Mr. Bernard Partridge."

Low Tide on Grand Pré. A Book of Lyrics. By Bliss Carman. 16mo, pp. 120. New York : Charles L. Webster & Co. \$1.

Bliss Carman has a secure place among the poets of the younger Canadian school, and his name is a familiar one on the pages of our magazines and other periodicals. His slight, newly published volume contains some two score poems, "collected with reference to their similarity of tone," which are in the main lyrics of love and of nature—particularly of the seaside. Mr. Carman's versification is easy and finished for the most part, but we believe he would oblige a good many readers by ruling out occasional obscurities of conception and vagueness of diction, or what appear obscurities and vagueness to uninitiated minds. However, Mr. Carman's verses belong, as it seems to us, to that species of verse which is called poetry.

Sometime, and Other Poems. By May Riley Smith. 16mo, pp. 168. New York : Anson D. F. Randolph & Co. \$1.25.

The versification and the thought of May Riley Smith's poems are clear and simple. Among the numerous short

lyrics are a few in light vein, but the majority show a deep moral tone, and many are expressive of directly religious feeling. Her collection makes a safe volume to put into the hands of any lover of tender and true reflective poetry not too deep for a tired brain.

Under the Nursery Lamp. Songs about the Little Ones. 16mo, pp. 105. New York : Anson D. F. Randolph & Co. \$1.50.

No compiler's name appears with the songs here gathered, and a considerable number of the poems have no name attached. There are a half dozen charming full-page photograph illustrations in the spirit of such verses as Stevenson's "My Bed-Boat," Dobson's "The Child Musician," Celia Thaxter's "An Old Saw," Margaret Vandegrift's "The Sandman," Tennyson's "Sweet and Low," Field's "Little Boy Blue," and numerous others. No daintier bit of literature could be desired by one who cares for the poetry inspired by child-life.

Pictures from Nature and Life. Poems by Kate Raworth Holmes ; illustrated by Helen E. Stevenson. Quarto, pp. 105. Chicago : A. C. McClurg & Co. \$2.50.

Though we cannot truthfully say that we admire the covers of this volume, the lyrical versification by Kate Raworth Holmes and the attractive illustrations by Helen E. Stevenson give it rank among the better class of gift books. The ten poems are upon various aspects of love and nature, and are clearly printed in a decorative style of type, which well preserves the delicate and reflective sentiments of the verse.

The Other Side : An Historic Poem. By Virginia Frazer Boyle. 12mo, pp. 64. Memphis, Tenn. : A. R. Taylor & Co. \$1.

This poem, dedicated "To Confederate Soldiers Living and Dead and to the Women of the South," is a reverie in imaginative style and written largely in blank verse, upon the cause of the rupture between North and South, of the war, of reconstruction, and particularly of the part Jefferson Davis played in the cause of the Confederacy. Mr. Davis, as the poem pictures him to us, is a hero and a martyr. These lines have a sustained dignity and a poetic expression which make them worthy to be read by any lover of good verse. The genuine feeling of affection for the "true, tender, loving, proud old South" ought to appeal to any unprejudiced respecter of the impulses from which art is born.

Cristoforo Colon : An Epic Poem. By Oscar A. Fliesburg and Lewis P. Johnson. Paper, 4to, pp. 102. St. Paul, Minn. : Swedish-American Book Company. \$1.75.

"Cristoforo Colon" is an epic poem whose *origin d'être* was the late Columbian anniversary. The poem was originally written in Swedish and then translated into English with the rugged and varied metres of the Northern tongue preserved. This method of composition is unique, as is also the legend of Columbus' descent from viking blood, and the story of his visit to Iceland, which precedes an account of his famous voyage of discovery. There are many excellent, vigorous passages in the course of the poem, and it is worthy of examination by those who would be naturally interested in such subject and treatment. There are a large number of full-page illustrations.

In This Our World. Poems by Charlotte Perkins Stetson. Paper, 16mo, pp. 120. Oakland, Cal. : McCombs & Vaughn.

Some of the shorter lyrics in this little collection from the Pacific Coast are decidedly good—poetic in conception and execution.

Sun-Sealed. By George P. McIntyre. 12mo, pp. 186. Chicago : Astronomic Publishing Co. \$1.25.

Mr. McIntyre is a professional Mystic of the city of Chicago, and his verses are "astrologically arranged under the incentive planet aspected by accurate calculation at each inception."

EDUCATION AND TEXT-BOOKS.

Mental Development in the Child. By W. Preyer. 12mo, pp. 196. New York : D. Appleton & Co. \$1.

Among the educational works which come to our desk this month two are of importance and presumable interest even to those whose immediate activity may not be along educational lines, in a professional sense. As number twenty-four of the "International Education Series," which our Doctor William T. Harris is editing, we have a translation by H. W.

Brown of an able German treatise by Professor Preyer, of the Physiological Department at Jena. Professor Preyer's "Die Seele des Kindes," first published in 1881, has already, in English form, found place in two volumes of the series to which the present translation belongs. The author is an enthusiastic investigator of the phenomena of child life, especially for the first five years, and desirous of stimulating a wider study of a subject, surely fascinating and strangely enough almost entirely new. Dr. Harris tells us in his editorial preface to the "Mental Development in the Child" that the particular object of the book "is to initiate mothers into the complicated science of psychogenesis. Accordingly he [Dr. Preyer] has taken unusual pains to present the more important points upon which the development of the child's mind depends in a form easy of assimilation." Many interesting results of Professor Preyer's studies are presented in a practical form in these pages, one of the most striking being his proof that language is subsequent to the intellectual perception of space, time and cause. The scope of the volume may be further defined by an examination of the chapter headings: "The Senses of the New-Born Child," "Temperaments in Infancy," "The First Perception of Ideas," "The Origin of the Will," "The Development of Self-consciousness," etc. Parents and teachers of small children will be especially benefited by a reading of Doctor Preyer's facts and suggestions.

The Science of Education. By Johann Friedrich Herbart. 12mo, pp. 284. Boston: Ginn & Co. \$1.

In this department we have had frequent occasion to mention works more or less closely connected with the Herbartian philosophy. Messrs. D. C. Heath & Co. now add to their "Pedagogical Library" a translation of two works of the master himself—the "Æsthetic Revelation of the World," and "The Science of Education" ("Allgemeine Pädagogik"). The translators, Mr. and Mrs. Henry M. Felkin, have written some fifty or sixty pages upon "Herbart's Life and Educational Work," and they have rendered his chief educational treatise into English upon the principle that "accuracy, faithful representation, is a translator's first duty and virtue." It is probable, therefore, that the reader will find here as close a contact with Herbart's pedagogical principles as is possible to one not reading the original German.

The Ethics of Hegel. Translated from his "Rechtsphilosophie." With an Introduction by J. Macbride Sterrett, D.D. 12mo, pp. 228. Boston: Ginn & Co. \$1.10.

The particular object of the "Ethical Series" edited by Professor E. Hershey Sneath, of Yale, in which Dr. Sterrett's book finds place, is to stimulate a better method and spirit in undergraduate collegiate study in ethics by putting the student in direct contact with important works. This volume contains an English rendering of about one-half of Hegel's "Philosophie des Rechts," with extracts from two other of his works. Like other members of the series it is furnished with a bibliography, biographical sketch, exposition of the text and statement of the relations of the subject-matter to previous and subsequent ethical doctrine. Dr. Sterrett states that he has made his introduction popular, and he has also added a vocabulary of the chief technical terms employed by Hegel.

The Eighth Book of Vergil's Æneid. Edited for the Use of Schools by John Tetlow, D.Sc. 16mo, pp. 203. Boston: Ginn & Co. 50 cents.

Doctor Tetlow believes it to be beneficial for student and teacher to vary monotony by reading one of the later books of the Æneid. He has prepared the text of the Eighth Book, and with a view of making it useful in sight-reading added map, foot notes, some fifty pages of notes arranged together, a large number of "word-groups," and a vocabulary of about eighty pages.

Cinq-Mars. By Alfred de Vigny. Abridged and edited, with introduction and notes, by Charles Sankey, M.A. 12mo, pp. 291. Boston: D. C. Heath & Co. 90 cents.

This volume is a new addition to D. C. Heath & Co.'s admirable and extended "Modern Language Series." So far as the text goes Mr. Sankey has made his selection upon the principle of preserving the work's "historical value as a picture of Richelieu and his time, its interest as a romance, and the classical purity of its style," and by narrative in English supplied the place of necessary omissions; his editorial labor also includes a historical introduction, notes mainly historical, a brief biographical sketch, etc.

Popular Science. Edited and annotated by Jules Luquiens, Ph.D. 12mo, pp. 252. Boston: Ginn & Co. 70 cents.

Doctor Luquiens has brought together the original French text of seven short selections of such nature as to come under

the heading "Popular [as distinguished from pure] Science." The aim of the book is to "provide material suitable for imparting the habit of careful reading and, in a measure, the vocabulary of scientific literature."

La Prise de la Bastille. By J. Michelet. Paper, 12mo, pp. 55. Boston: Ginn & Co. 25 cents.

A condensed selection from Michelet's "History of the French Revolution," edited and annotated by Doctor Jules Luquiens, of Yale University.

Goethe's Dichtung und Wahrheit. Edited, with introductions, notes and index, by C. A. Buchheim. 12mo, pp. 337. Boston: D. C. Heath & Co. \$1.05.

This volume, which is an addition to the well-known "Modern Language Series," contains the first four books of Goethe's famous autobiography. Doctor Buchheim states in his preface that he has "explained throughout all the historical, biographical, literary and other allusions," and he has added a general deal of annotation in general.

Brigitta. By Berthold Auerbach. With introduction and notes by J. Howard Gore, Ph.D. 12mo, pp. 123. Boston: Ginn & Co. 55 cents.

"Brigitta" was written in 1840, only two years before the author's death. Dr. Gore believes it is well adapted for "sight-reading or regular work for a less advanced class."

The German Declensions Simplified and Symbolized so as to make their acquisition rapid and permanent. By William A. Wheatley. 12mo, pp. 53. Syracuse: C. W. Bardeen. 25 cents.

Elementary Laboratory Cards. Mechanics and Electricity. By Harlow W. Eaton, A.M., Ph.D. Chicago: W. A. Olmsted, 182 Wabash Avenue.

Dr. Eaton prepared this card system for his own classes and has found it of excellent service in the teaching of physics. A separate card, with directions for experiment, is put into the hands of each pupil. The cards form a series from 1 to 153 and we suppose an unlimited supply of any number or of all can be obtained.

The Essentials of Chemical Physiology, for the Use of Students. By W. D. Halliburton, M.D., F.R.S. Octavo, pp. 177. New York: Longmans, Green & Co. \$1.50.

The author of this treatise is professor of physiology in King's College, London, and holds other English academic positions. His pages, well illustrated, are the outgrowth of practical teaching, and furnish information regarding the chemistry of foods, digestion, the blood and allied subjects.

Little People's Reader. By Georgia A. Hodskins. 12mo, pp. 107. Boston: Ginn & Co. 30 cents.

Simple reading matter in large print and simple illustrations, designed for the first grade of pupils.

My Saturday Bird Class. By Margaret Miller. 12mo, pp. 107. Boston: D. C. Heath & Co. 30 cents.

The author of this little volume has had success in interesting small children in the study of nature, and with a view of extending her plan has given a sort of journal of her walks and talks, and dialogue with her pupils. Her pages are illustrated, and she gives a brief scientific substratum to her bird lore, as "Hints for the Teacher."

History and Literature in Grammar Grades. By J. H. Phillips, Ph.D. 12mo, pp. 17. Boston: D. C. Heath & Co. 15 cents.

A paper read before the Department of Superintendence at Brooklyn, some time ago. Dr. Phillips is at the head of the public school system of Birmingham, Ala.

The School Singer. A Collection of Favorite Songs and Chorals for Schools. Compiled by George A. Veazie. Octavo, pp. 168. Boston: Ginn & Co. 60 cents.

Mr. Veazie's preface states that his volume is "not a book of exercises, but a careful compilation of popular songs and choruses of medium difficulty, from 'The Coda,' and which are expressly adapted to school use." It has selections for

Arbor Day, graduation day, and other important occasions in school life, as well as for the usual routine periods. The print of both music and words is very clear and attractive.

JUVENILE.

The Young Navigators; or, The Foreign Cruise of the "Maud." By Oliver Optic. 12mo, pp. 356. Boston: Lee & Shepard. \$1.25.

Oliver Optic's indefatigable pen is still moving and producing books to satiate the boys' appetite for the adventurous and marvelous. In the "Young Navigators" the hero and his friends sail about storied Greece, and the author weaves in mention of many historical and mythological events. The book is the second volume of the second series of "All Over the World Library."

Oscar Peterson, Ranchman and Ranger. By Henry Willard French. 12mo, pp. 380. Boston: D. Lothrop Co. \$1.50.

Boys will appreciate a story which tells in a live way of adventures with wild animals, Indians and desperadoes in Manitoba and along a trail through the Dalrymple farm and Deadwood to the Colorado mines. The book is illustrated by a number of full page and lesser cuts.

Through Thick and Thin, and The Midshipmen's Mess. By Molly Elliot Seawell. 12mo, pp. 215. Boston: D. Lothrop Co.

Molly Elliot Seawell writes two stories which are, in the main, recitals of two sensible heroic deeds in the United States army and in the naval service respectively. The author tells us that the incidents related are both real happenings. The cover and illustrations are such as boys like.

Odd Business: High Art in Fun, Frolic and Fancy with the Pencil and Quill. By L. J. Bridgman. Quarto. Boston: D. Lothrop Co. \$1.25.

Mr. Bridgman's book has fun *per* pencil and pen on every page and a pun upon a good many of them. He is a capital humorist and surely successful in the pleasant task of making little folks laugh.

The Child's Day Book: With Helps Toward the Joy of Living and the Beautiful Heaven Above. Arranged and compiled by Margaret Sidney. Quarto. Boston: D. Lothrop Co. 50 cents.

Margaret Sidney's compilation has morning and evening prayers, grace before meals, a text from the Bible and a prose or poetical selection for each day of the month, all adapted for young children. There is a large number of illustrations, including five full-page colored inserts.

Chatterbox for 1893. Edited by J. Erskine Clarke, M.A. Quarto, pp. 412. \$1.25.

The favorite annual Chatterbox has already, in its 1893 covers, delighted the hearts of thousands of children, but if any parents have overlooked it in the stress of the gift-giving season it will still be a welcome addition to the young folks' book shelves. We do not see that the anecdotes of great men, of adventure, of heroic deeds, of animal life and the puzzles, stories, poems and, of course, the illustrations, are less interesting than they were in our own "Chatterbox" days.

The Out-Door World; or, Young Collector's Hand-Book. By W. Furneaux, F.R.G.S. 12mo, pp. 432. New York: Longmans, Green & Co. \$2.50.

Mr. Furneaux has had the enviable purpose of cultivating a taste for natural history in the minds of young people, and has told accurately, but in popular language, about a large number of insects, birds and larger animals, sea-weeds, wild flowers, forest trees, etc., etc. He has also given practical directions about the collection and care of specimens. The text is made very attractive by sixteen colored plates and by over five hundred minor illustrations. Unfortunately for young enthusiasts in America, the author deals mainly with British animal and vegetable life.

Talk by Queer Folks: More Land and Water Friends. By Mary E. Bamford. Quarto, pp. 179. Boston: D. Lothrop Co. \$1.25.

Mary E. Bamford allows the Hyena, the Blue-Jay, the Anemone, the Earth Worm and various other interesting people to tell some portion of their own story for the benefit of the little folks. Her book is printed in large type and is well

illustrated; it is apparently fitted to yield both entertainment and instruction for children eight or ten years of age or even younger.

TECHNOLOGY AND MANUFACTURE.

Photographic Mosaics: An Annual Record of Photographic Progress. Edited by Edward L. Wilson. Thirtieth Year. Paper, 16mo, pp. 295. New York: Edward L. Wilson. 50 cents.

Mr. Edward L. Wilson has been prominent in photographic circles for something over a quarter of a century, and the new issue of his annual, "Photographic Mosaics," is the thirtieth. It contains a summary of progress in the various departments of photographic science for the year 1893, and a long series of short, specially contributed articles by prominent lovers of the art, devoted mainly to matters of technique and artistic judgment. To the progressive amateur the whole volume is indispensable, and the fully-illustrated article upon Brittany, by A. R. Dresser, will be of general interest. The volume is indexed and in every way seems creditable.

A Field Book for Civil Engineers. By Daniel Carhart, C. E. 16mo, 1 p. 293. Boston: Ginn & Co. \$2.50.

Mr. Carhart, who is Professor of Civil Engineering in the Western University of Pennsylvania, has prepared a new manual treating systematically of field work in railroad surveying from reconnoissance to track laying. It presents a neat appearance, is well illustrated and apparently serviceable.

Continuous Current Dynamos and Motors. By Frank P. Cox. 12mo, pp. 271. New York: The W. J. Johnston Company. \$2.

The student for whom this work has been prepared is supposed to possess a "general knowledge of electricity and is conversant with the names of the different parts of the machines," and, in the mathematical field, with algebra and elementary geometry. It is an eminently practical manual and illustrated with a number of helpful diagrams. Two chapters are devoted to the action of steam in an engine.

A Text-Book of Mechanical Drawing. Part III. Machine Drawing. By Gardner C. Anthony, A.M. Tufts' College, Mass.: Published by the Author.

This illustrated treatise is, according to the preface, "intended to teach the practical application of the principles of projection to the illustration of machinery; to inform the student concerning many of the exceptions to the laws of projection; and, finally, to furnish such practical examples as may serve for problems to the student and suggestions to the draftsman."

The Manufacture of Liquors and Preserves. Translated from the French of J. De Brevans. 12mo, pp. 204. New York: Munn & Co. \$3.

This book is a translation of a practical and precise manual for the distiller and liquor manufacturer, which appeared in France a few years ago. The translator states that the value of the work "consists in the formulas, which are so arranged that if the manufacturer has no distilling plant, he can still make many of the liquors from the essences." With sixty-five illustrations.

PARLIAMENTARY PROCEDURE AND BUSINESS.

Congressional Manual of Parliamentary Practice. By J. Howard Gore, Ph.D. 32mo, pp. 112. Syracuse: C. W. Bardeen. 50 cents.

Dr. Gore has deduced the contents of his little manual from the rules and rulings of the national congress. The subjects are arranged alphabetically.

Parliamentary Tactics for the Use of the Presiding Officer and Public Speakers. Arranged by Harry W. Hoot. 12mo, pp. 51. New York: Scientific Publishing Company. 50 cents.

A novel feature in this flexible covered booklet is the marginal index, which serves also as a list of motions in the order of precedence. Rapid reference is the object in view.

Walsh's Perpetual Calendar and Almanac. By James A. Walsh. Washington: Brentano's. \$1.

Mr. Walsh's perpetual calendar is simple and convenient, and with its added moon table, sun table and other matter will probably prove of service to lawyers and professional and business workers in general.

CONTENTS OF REVIEWS AND MAGAZINES.

No. 2

THE PROGRESS OF THE WORLD.

*The
Manchester
Ship Canal.*

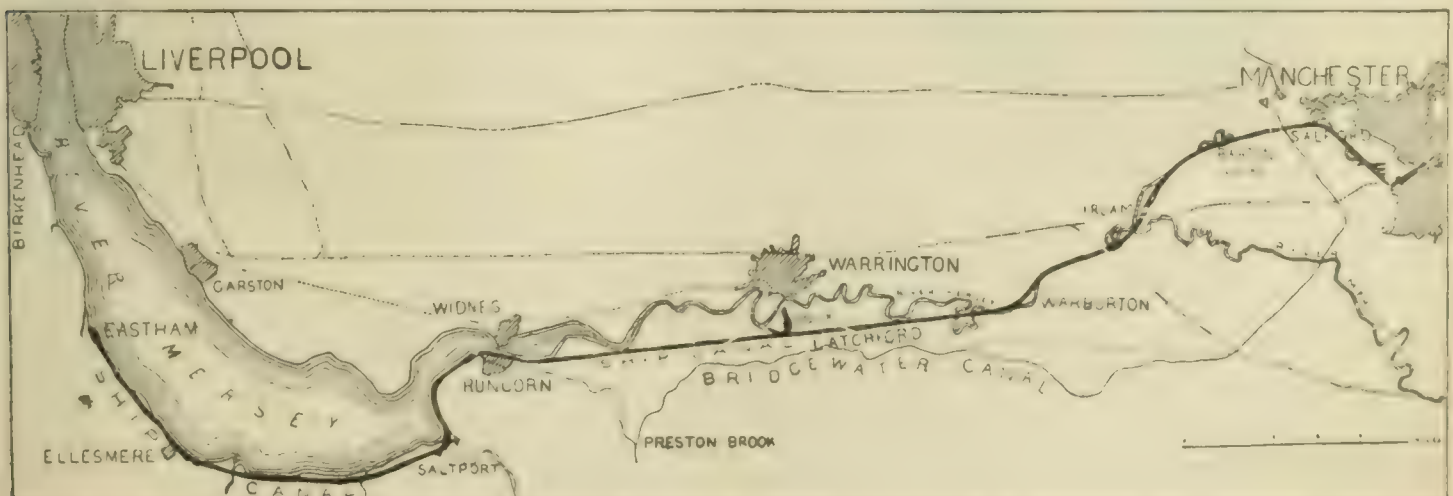

The opening of the Manchester, England, ship canal on January 1 was an event of far more than local importance. We in America were once in danger of falling into a kind of lethargy under the soothing impression that we possessed a monopoly of the world's energy and audacity in engineering enterprises and other great material undertakings. Nothing could be further from the truth, and it is well that we are giving more heed and showing more respect to the colossal activities that mark the last quarter of the nineteenth century in Europe. The Manchester ship canal transformed a great interior city into a seaport. It is a fact that the new canal constitutes the nearest shipping point for some eight millions of people, nearly all of whom are engaged in manufacturing industries in scores of towns and cities dotted over the region contiguous to the adjacent cities of Manchester and Salford, at whose great artificial docks the canal begins. The whole canal is indeed an extended dock. It is twice as wide as the Suez canal, and deep enough for all ocean-going steamers with the possible exception of a very few of the largest transatlantic liners. The cost of the undertaking has been some \$75,000,000. The canal reaches the sea through the estuary of the river Mersey in the neighborhood of Liverpool. Its initial difficulties were great enough to have appalled the stoutest-hearted. The city of Liverpool exerted itself to the utmost to prevent the granting of the charter, holding that it would be a great injury to the ship-

ping interests of Liverpool if Manchester were allowed to become a port. The railway companies, which had profited by the heavy traffic from Liverpool to

MR. E. LEADER WILLIAMS,
Chief Engineer of the Manchester Canal.

Manchester, were naturally up in arms against the project, and there were several ordinary old-fashioned canals which lay across the route and had to be disposed of in some manner. Every one of these diffi-

culties was met and vanquished. Railroad lines were elevated and carried over the new canal on bridges. Intersecting canals were also lifted high in air with extra locks and stupendous viaducts. While not an exclusively municipal enterprise, this great work has from the outset had the moral support of the Manchester corporation, and that city has loaned to the canal company \$25,000,000, and now has a majority of directors in the governing board of the canal. Salford and Oldham, with perhaps other neighboring cities, came forward in the time of the canal's financial extremity with offers of large loans. This circumstance is interesting to us in America as showing the efficient character of English municipal government and its capacity for action in matters which really pertain to the broad general interests of the community. There is reason to believe that this canal will be a financial success. Not only will the

VIEW OF MANCHESTER CANAL TWO MILES ABOVE EASTHAM.

SIR JOHN J. HARWOOD,
Alderman of Manchester and a Municipal Director of the Canal.

steamships which carry American cotton crowd its wharves, but vessels from all parts of the world will enter it, and a very great coastwise British traffic will result immediately. The value of waterways and their relation to commercial progress and municipal aggrandizement is one of the first articles of faith in the creed of Manchester business men; while there is plenty of evidence that a like belief is gaining foothold in all industrial and commercial countries.

*The Making
of Modern
Seaports.*

It is to be remembered that Manchester had before her eyes the ever-notable example of Glasgow on the Clyde. The Clyde was formerly a little rivulet so shallow that at some seasons it could be waded. It now furnishes dockage facilities to an enormous sea-going traffic, and on its banks are built a very large proportion of all the steel ships of the world. It is in effect an artificial ship canal some thirty feet deep, maintained by the Clyde Navigation Trust of the city of Glasgow. Scores of millions have been spent upon it, and Glasgow has its reward in its proud rank as the first city of the British Empire excepting London. The German ports have, especially since the establishment of the present empire, become keenly alive to the value of the best possible harbor and dockage facilities. Hamburg, which lies well inland on the Elbe, has within the past ten years expended, including subsidies from the Imperial Government, a sum of perhaps not less than \$50,000,000 in improving and deepening the channels, and in building vast new docks in the Hamburg harbor, provided with every modern facility; and Bremen's improvements are notable.

*Brussels
also
to be a Port.*

The next considerable scheme for adding a great inland city to the list of seaports is the Brussels ship canal project. Brussels already has a small channel for ordinary canal boats which makes its way to the sea, and it is proposed to utilize this passage, transforming it into a veritable waterway for ocean-going ships. The present plan does not contemplate a depth great enough for vessels of the first rank, but it is estimated that an expenditure of some \$10,000,000 would complete the system in such a manner as to give a uniform depth of twenty-two feet, which would admit vessels of somewhat more than two thousand tons. The

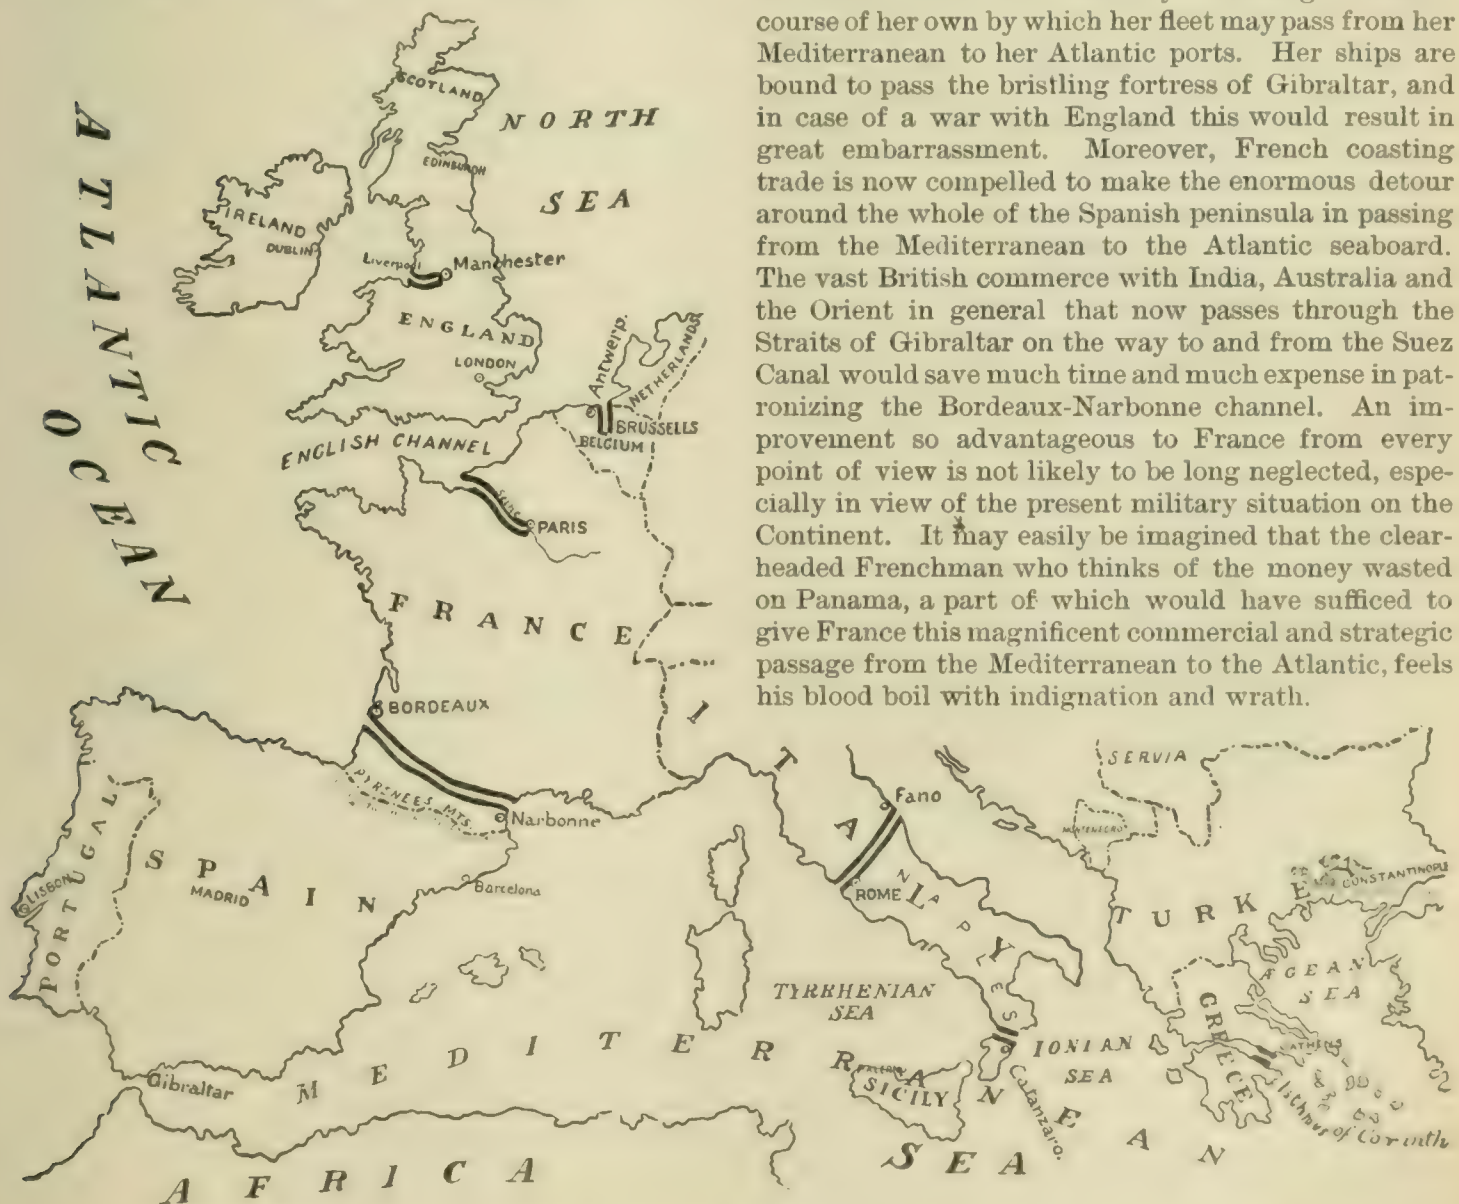

Belgian government has already made a subsidy appropriation towards the project, and has offered to take a considerable part of the stock of the canal company, so that the plan may be considered as upon a practically assured basis.

The Maritime Ambitions of Paris.

It is not generally known here in America, perhaps, that for some years the most serious engineering investigations have been in progress in the interest of a deep water passage from Paris to the sea. It is to be regretted that Count Ferdinand de Lesseps, who by the way has lived on into the year 1894, had not devoted his talents to the construction of waterways at home rather than to the hopeless Panama project. Marvelous things could have been done for France with the two thousand million francs, more or less, of honest French money that were squandered by the Panama company. With the help of the river Seine it is now considered perfectly feasible from the engineering point of view, and also reasonably safe on the financial side, to enter in the early future upon the dredging of a deep water passage from the French capital to the Channel coast at Havre.

A Still Greater French Scheme.

Furthermore, the Paris project of direct navigable communication with the sea is not the only ship-canal scheme that is now in the minds of the French people. A great canal from Bordeaux on the Atlantic coast across the narrow neck north of the Pyrenees to Narbonne on the Mediterranean coast is now a project definitely entertained. A bill for the construction of this maritime passage was introduced in the French Chamber last spring, when it was explained that the waterway would be three hundred and twenty-five miles long, that it would vary in width from one hundred and twenty feet to some two hundred feet or more, and that it would have a minimum uniform depth of twenty-seven feet. Large money prizes were offered by the projectors of the enterprise to the French engineers for detailed plans, which were to be submitted by January 1, 1894. It is to be expected that a year or two longer may be required for the perfection of the preliminaries, but sooner or later France will undoubtedly build this canal. A glance at the map of Europe will show its great significance and commercial value. From the strategic point of view, France now labors under the difficulty of having no water-course of her own by which her fleet may pass from her Mediterranean to her Atlantic ports. Her ships are bound to pass the bristling fortress of Gibraltar, and in case of a war with England this would result in great embarrassment. Moreover, French coasting trade is now compelled to make the enormous detour around the whole of the Spanish peninsula in passing from the Mediterranean to the Atlantic seaboard. The vast British commerce with India, Australia and the Orient in general that now passes through the Straits of Gibraltar on the way to and from the Suez Canal would save much time and much expense in patronizing the Bordeaux-Narbonne channel. An improvement so advantageous to France from every point of view is not likely to be long neglected, especially in view of the present military situation on the Continent. It may easily be imagined that the clear-headed Frenchman who thinks of the money wasted on Panama, a part of which would have sufficed to give France this magnificent commercial and strategic passage from the Mediterranean to the Atlantic, feels his blood boil with indignation and wrath.

OUTLINE MAP TO ILLUSTRATE DISCUSSION OF EXISTING AND PROPOSED SHIP CANALS.

*Value
of the
Corinth Canal.*

The past year has seen the completion of another notable maritime canal. Little Greece, in the face of financial difficulties to which it has at length been obliged to succumb, has been at work since 1882 upon a ship canal across the high and rocky Isthmus of Corinth. The undertaking was finished last summer and opened by the King of Greece on August 6. The passage is only four miles long, but for the more considerable portion of this distance the cut is from one hundred to two hundred feet deep, and a vast deal of heavy masonry has been needed to protect the walls. The enterprise seems to have cost from \$12,000,000 to \$15,000,000. Its convenience is manifest when one looks at the map of the Mediterranean peninsula. The voyage from Brindisi or Trieste to Athens, Smyrna or Constantinople, or any of the ports in that part of the world, is very materially shortened, nearly one day being saved. The completion of this waterway will be of such material advantage to Greece that perhaps within the next few years it may assist greatly in the recovery of the financial credit which now seems lost almost beyond the power of redemption.

*Proposed
Italian
Ship Canals.*

Italy also has her important maritime canal schemes, although the desperate financial condition of that Mediterranean peninsula may defer for some time the desired improvements. Definite proposals have been brought forward for two great ship canals, one of them across the leg and the other across the foot of the Italian boot. The first of these proposals is for a canal beginning on the west coast near Rome, at Montalto di Castro, and proceeding in a northeasterly direction and at a length of 125 miles to the Adriatic Sea at Fano, on the east coast. A very great passage is proposed, with a width of 270 feet, and a depth of water of not less than forty feet, thus providing for the transit of the heaviest Italian war ships. Italy is by nature a naval rather than a military power, and this canal would be worth more from the defensive point of view than several army corps. Its cost is estimated at from \$100,000,000 to \$125,000,000. If Italy would undertake this great work as a public function and employ upon it her standing army, and her still greater army of lazzaroni and beggars, she would have something useful to show for a vast productive capacity that is now going to sheer waste. It is claimed that one of the great benefits of this canal would be the drying out of numerous large boggy districts and the drainage of four lakes, thus adding large areas of productive soil. The other Italian project is that of a ship canal twenty-four miles long across the province of Catanzaro, well down toward the toe of the geographical boot. This channel would be of immense advantage to Mediterranean commerce, inasmuch as it would obviate the necessity of going around Sicily or threading the difficult Straits of Messina. For this canal it is also claimed that large areas of now unavailable land would be drained and made highly productive, this result alone promis-

ing, according to the promoters of the scheme, to pay all the expenses of the undertaking.

*A Channel
Across
Ireland.*

It is perhaps worth while to make note of the fact that the discussion of ship canals has now gone so far as to include the serious proposition by no less an authority than Sir Edward Watkin, M.P., the great English railroad magnate, of a canal across Ireland to make a more direct route for transatlantic steamers bound for Liverpool. This proposition has been coupled with the still more active discussion of a tunnel between Scotland and Ireland. Sir Edward claims that both the tunnel and the ship canal could be completed for \$100,000,000, but his opinions as to the value of these schemes and as to their cost have been assailed in several quarters. Nothing in the present decade is at all likely to be done with either proposition, nevertheless the fact of their discussion by responsible authorities has its interest.

*American
Canal
Projects.*

In the new world, maritime canal projects have received some other temporary setbacks besides the grand collapse at Panama. The financial panic of the past year has involved the Nicaragua Company in serious difficulties. This project, however, has received a new impetus from the cordial manner in which President Cleveland in his recent message to Congress has advocated the early completion of the canal under

GOVERNOR FLOWER, OF NEW YORK.

American auspices. It is to be hoped that Congress will not be afraid to give this canal some form of support. The best plan would be to construct it as a United States government enterprise, under the eye of our own accomplished army engineer corps. Meanwhile, the question of improved waterway routes from the great lakes to the sea, which the REVIEW OF

REVIEWS has more than once presented to its readers, continues to hold attention. The Canadians, who have shown more foresight and enterprise than we on the American side, have now nearly completed their series of enlargements of old canals and new undertakings,—including the channel on Canadian soil at the Sault Ste. Marie,—which will give Canada exclusive control of an uninterrupted water passage fourteen feet deep from the head of Lake Superior to deep water at the mouth of the St. Lawrence. This channel will suffice for a large class of lake steamers, and will also be available for small and medium-sized ocean-going freight ships. Our own government is providing a satisfactory deep-water passage from Duluth to Buffalo, but nothing has been done to commit the country to a maritime passage connecting Lake Erie with the deep channel of the Hudson River. A ship canal along this general course would cost a large amount of money, but it would pay abundantly for the investment. The United States government, which could probably borrow money for such a purpose at $2\frac{1}{2}$ per cent., and which through its trained engineers could construct the work without any waste or extravagance, ought in the early future to consider seriously the undertaking. Meanwhile, Congress would do well to make a thorough inquiry into the cost and advantages of such a ship canal. In his recent message to the New York legislature, Governor Flower pronounces against the ship canal on the score of its great cost. But the Governor happens to have his whole mind wrapped up in certain improvements of a limited sort to the Erie Canal as it now exists. His principal hobby is the operation of canal boats by electricity, a trolley wire being stretched along the tow-path. The competent critics are of the opinion that Governor Flower is quite too sanguine as to the results that would follow a substitution of the trolley for the tow-path mule. The banks of the canal would not permit a much greater speed than that which is now attained, and the saving of expense would not be material enough to accomplish revolutionary results. It may easily be believed that the trolley along the Erie Canal would be of sufficient advantage to justify its construction and operation; but to dismiss as hopelessly unfeasible the plan of a deep-water channel across New York, and then to fasten one's hopes for the future upon the mere change from one propelling power to another for ordinary canal boats, is to look at the whole subject through the wrong end of the telescope. This country will have fallen behind old Europe in enterprise if it does not adopt the plan of a ship canal from the great lakes to the sea, make the Hennepin Canal connecting Lake Michigan and the Mississippi River a splendid success, cut the long desired Delaware and Maryland Ship Canal, undertake the proposed Florida Canal, the advantages of which have been so long recognized, and in short, commit itself unreservedly to the policy of constructing all great waterways which the demands of commerce show to be needful and feasible.

*Filling the
Supreme Court
Vacancy*

On January 15 the Senate took final action upon the President's nomination of Mr. Hornblower, a young attorney of New York City, to be a Judge of the Supreme Court. The nomination was emphatically rejected. Opinions of a widely varying character were expressed as to Mr. Hornblower's qualifications. The general public had never heard of him. From all that has now been printed about him, however, it is fair to assume that he is an exceptionally able lawyer. The fundamental objection to his appointment is that it was a purely personal one on Mr. Cleveland's part. It is literally true that if the vacant office were seeking the man there are hundreds, even thousands, of men whose names would precede Mr. Hornblower's in the list of eligibles. There are the tried and well known men serving on the Federal Circuit and District benches. They have given up all hope or prospect of lucrative private practice at the bar, having entered for life upon the public service. It strikes one as a rather painful thing that the President should pass by all these men, eminently qualified as many of them are to sit on the Supreme Bench, and should name a personal friend of whom the country has never heard, who has accumulated means as a corporation lawyer, and who would now enjoy the almost matchless honor of a place on the United States Supreme Bench. Then there are the distinguished jurists who sit on the Supreme benches of the forty-four States, and many men of marked fitness who hold other judicial positions. The salaries of judges are not large; and the men who serve us in that capacity deserve the most considerate treatment. The Supreme Bench is the very keystone of our political structure. It maintains the delicate balance between State and Federal authority, and it must constantly decide questions of momentous consequence. When the constitution gave to the President the initiative in naming the judges, it was never thought for a moment that he would regard a vacant post on the Supreme Bench as a personal perquisite, like a private secretaryship. It is quite enough that Mr. Cleveland has been disposed to take this purely personal view of the Cabinet places; but the line should be drawn at the Supreme Bench. After Mr. Hornblower's rejection it was asserted that Senator Gray, of Delaware, would be appointed. He is understood to have had judicial experience and to be eminently qualified for the post. He would of course be immediately confirmed by his fellow Senators. But the fact that he has been Mr. Cleveland's close political representative in the Senate gives a personal flavor to the idea of this choice that is not wholly agreeable. A selection from outside the law-making branch of the government would be far more dignified.

*The Attempt
to Restore
Hawaiian Monarchy.*

The policy of this Administration towards Hawaii, worked out in secrecy through so many long months, has been forced by circumstances to a full

From photographs by Bell, Washington.

Senator Frye, of Maine.

Representative Boutelle, of Maine.

THE TWO LEADERS IN THE CONGRESSIONAL OPPOSITION TO THE PRESIDENT'S HAWAIIAN POLICY.

disclosure. It constitutes the most shameful and the most fatuously blundering chapter in all the history of American diplomacy. It is a painful and humiliating subject to discuss. The Executive government of the United States is left in the position of a huge and insolent bully completely baffled and made the butt of the whole world's ridicule by the firmness and courage of its lilliputian opponent. Nevertheless there are some consolations. If the American President and Cabinet at Washington do not come out of the encounter with any credit or glory, there is an American President and an American Cabinet in Honolulu that have covered themselves with lasting renown. President Dole's reply to President Cleveland's peremptory demand that the Hawaiian government should immediately abdicate, in pursuance of Mr. Cleveland's plan of establishing by force of American arms an odious monarchy in Hawaii, is one of the most spirited and one of the strongest documents in American history. For the policy of Mr. Cleveland and Mr. Gresham there is hardly an extenuating word to be said. It involved the gravest violations of the constitution. And it involved a duplicity in Mr. Willis's simultaneous missions to the

Hawaiian government and to the deposed Liliuokalani, that has no parallel in the history of modern diplomacy. When Mr. Cleveland sent the first batch of Hawaiian correspondence to Congress, he withheld a very important letter from Mr. Willis that he has at length reluctantly made public in his further yielding up of the dispatches that have passed between the State Department and the Minister to Hawaii. That letter contains Mr. Willis's account of his secret session with Liliuokalani, in which he was endeavoring to persuade her to accept Mr. Cleveland's plan for restoring her and overthrowing the government to which Mr. Cleveland had just accredited Mr. Willis with expressions of friendship and good will. It seems hardly possible that Congress can ignore so grave a breach of diplomatic honor and of international fair dealing as this attempt by an American Minister to subvert the government to which he was accredited. What Minister Stevens may or may not have done under President Harrison's Administration has no more bearing upon the programme that Mr. Cleveland, Mr. Gresham and Mr. Willis have attempted to carry out, than what may or may not have happened in the garden of Eden.

Constitutional Aspects of Mr. Cleveland's Course.

Fortunately, the mere publicity of the facts and correspondence suffices to defeat this inexcusable plot. Hawaii will continue for the present to regulate its own domestic affairs. It will require infinite forbearance on the part of the Hawaiian government to tolerate on the Islands, in the post of American Minister, a man who is now held up to the world as an exposed agent sent expressly to effect the destruction of that government. But it is well to remember that Mr. Willis can hardly have had any real taste for his task, and that he is probably thankful for orders to desist. A great many people who had no clear opinion before will now think that President Dole and his patriotic supporters have well earned the annexation to America that they so ardently desire for Hawaii. The Senate Committee on Foreign Relations has been carefully investigating the whole course of our recent diplomatic relations with the Islands, and its report will be a matter of unusual interest. The Senate's prerogatives have been so contemptuously ignored by the Administration that it would be strange if that body should fail to assert itself to the extent of condemning much that has been done. There are marked indications of a growing breach between the White House and a large contingent of the Democrats in both Houses of Congress; and the President can hardly expect that his practical assumption of the war power without consulting Congress, and in the face of no emergency or provocation of any kind, can be passed over without some very disagreeable debating in both Houses. Mr. Cleveland still persists in declaring that it was the duty of the United States to restore Liliuokalani. But why, then, has he never pursued the one obvious, lawful course that was open to him? He should have sent an explicit message to Congress, declaring his opinion and asking for authority to proceed with the restoration. The favorable vote of Congress would have set the war power in motion, and the President with the aid of the ships in Honolulu harbor would have set up the monarchy without delay and without striking a blow. Why has he failed to pursue that one lawful course? There has come no answer. Congress owes it to the future of constitutional government in this country to seek some kind of an answer to that question,—a question far more important for the American people than the future of Hawaii.

The Pending Tariff and Revenue Bills.

The date fixed for the final vote on the Wilson tariff bill in the House was January 29. That it would pass by a large majority was a foregone conclusion. Like every other complicated tariff bill it is a measure full of compromises, and at no stage has it had any really ardent friends. Mr. Wilson himself has defended it not as the kind of revenue bill he would like to present, but as the best approach toward his ideal of a revenue tariff that he could bring forward as a practical possibility under existing circumstances. Evidently, considered as a protective measure, the

Wilson bill is maimed and deformed; while considered as a revenue tariff it is but feebly adapted to a period of treasury deficits. Its passage is expected to diminish rather than to increase the revenues from imports, and the gap in the national income will have to be made up by a large increase in the internal taxes, and perhaps by the adoption of a new source of revenue such as an income or a corporation tax. If as a measure designed solely for the production of public revenue the Wilson bill were wholly adequate and upon lines permanently defensible, there would be no particular reason to borrow trouble about it on the score of its hostility to protected American industries. It is, upon the whole, a rather high protective scheme; and anyhow business could soon adjust itself to its new schedules. But the trouble is that the measure does not carry with it any promise of industrial peace and repose. It will hardly secure a breathing spell. It does not bear the faintest lineaments of resemblance to the kind of tariff that the free trade wing of the Democratic party has been fighting for, and that the national platform has squarely committed the whole party to. Mr. Henry Watterson denounces it, and so do all the enthusiastic anti-protectionists. On the other hand, the out-and-out protectionists do not want a protective tariff framed by men avowedly opposed to protection, and they will make quick work of revising the Wilson bill if they come into power again. A courageous bill, upon the real lines of a revenue measure, introduced to take effect after a considerable period in which business might get ready for the change, would have ushered in a permanent new policy. Unfortunately for the pending measure it lacks character, form and distinctive principles. Mr. Wilson has tried to make it appear that the free wool item is of itself a sweeping and powerful reform. It is certainly very important. But the adding of wool to the free list does not change the general character of a measure composed of thousands of details, and free lumber, free coal and free salt are matters of deep concern to particular localities rather than to the nation at large.

This and five following sketches drawn from life at Washington in January for the REVIEW OF REVIEWS to illustrate the tariff debate.

CHAIRMAN WILSON.

*The Tariff
Debate
in the House.*

The tariff debate in Congress has made no pretense of being thorough or fundamental. A short debate was predetermined, and the Republicans had little opportunity to offer amendments or to make long speeches in opposition. But they were treated fairly enough. The Democrats are in power by a

large majority, and the country expects them to frame the new revenue measures in their own way. And the country will not fail to hold them responsible for the results. The history of this measure has shown rather amusingly that most tariff reform representatives are in favor of plenty of protection for the particular industries of their own districts. Nothing but a sense of the necessity of party loyalty and co-operation could have held the great Democratic majority together, in the face of so much individual squirming against particular features of the bill. The debate was full of telling hits, bright repartee and showy snatches of oratory, and it reveals the present Congress as a very able one, with an unusually large contingent of promising young men. The Southern and Western districts have been sending new blood of fine quality to Washington. Mr. Wilson himself is an orator of rare persuasiveness and eloquence, and he was well supported. Mr. Bourke Cockran, of New York, added much to his fame by an astonishingly clever speech. Mr. Reed, on the Republican side, remains the acknowledged parliamentary champion of the House, and Messrs. Burrows, Dalzell, Payne and the other Republican leaders acquitted themselves in a manner that won the admiration of their opponents and the hearty plaudits of their own partisans.

*The
Internal
Revenue.*

At first the Wilson bill included in one measure the revised tariff, the new internal revenue schemes, and an income tax. But there was so mutinous a murmur among many Democrats against the proposal of an income tax on all personal incomes in excess of \$4,000, that as a matter of safety the measure was divided into two distinct ones, and the customs tariff was brought in by itself. The principal changes proposed in the internal revenue system are a slight increase in the

whisky tax, a large increase in the beer tax, and a considerable stiffening up of the taxes upon tobacco in various forms. In view of the treasury situation, it would certainly seem desirable to place these taxes at the largest revenue-yielding point, though there may well be differences of opinion as to where that point lies.

*The Income Tax
and the
Democratic Position.*

The Democratic majority of the Ways and Means Committee had definitely decided upon an income tax; but the proposition was at once so widely condemned by the press of all parties and by the sentiment of business men as expressed in Boards of Trade and Chambers of Commerce, that the committee saw new light and was ready to abandon the idea for the present. Some form of a tax upon corporations has been much talked of as a substitute for the proposed income tax, and as a means of meeting the anticipated deficit. It is possible that such a tax could be successfully laid, and that it would add a new and valuable source of revenue to the national exchequer. But probably a majority of the wisest business men of the country would prefer to have the tariff and internal revenue taxes so adjusted as to make them productive of a sufficient revenue to meet the public necessities, without an attempt at this time to create a third principal source of income. It is to be remembered that

the revenue reformers now in power are the very men who have always advocated the English plan of a tax on the importation of tea, coffee and sugar, the Republican policy being to free such articles as rapidly as the opportunity to drop war imposts would allow. The Democrats, moreover, for two decades opposed the Republican plan of a high internal tax upon spirits and tobacco. It is curious, therefore, that Mr. Wilson in his maintenance and increase

"TOM" REED.

SPEAKER CRISP.

MR. McMILLIN, OF TENNESSEE.

the fact that when in power and actually responsible, the two great parties act very much like one another.

*Mr. Carlisle's
Bond Issue.*

This fact finds another striking illustration in Secretary Carlisle's sudden announcement of a new bond issue of \$50,000,000, without authority from Congress to borrow money, basing his action upon an almost forgotten clause of the specie resumption act of some twenty years ago that authorized the Secretary of the Treasury to sell 5 per cent. bonds if necessary to redeem the greenbacks and maintain them at par. The law did not, apparently, have the slightest reference to the sort of financial conditions now existing; but the great falling off in revenues and the rapid decline of the gold reserve in the Treasury has made prompt action of some kind very neces-

"TOM" JOHNSON.

of the free list and in his restoration of high internal taxes on whiskey, beer and tobacco, has placed himself upon the old established lines of Republican financiering, — where Garfield, for instance, stood, — and has cut away from the familiar historic moorings of the party in whose name he acts. His cause illustrates well

sary, and the Administration did not dare to risk the danger to the public credit of a long debate in Congress on a proposal to authorize a new public loan, in view of the well-known opposition of many Democratic Congressmen to that idea. Mr. Carlisle has probably acted for the best; but he has placed himself on ground that his own party had long and vigorously denounced. In view of the stringent efforts of the Treasury to protect the public credit and to meet current obligations that far exceed the current revenue, it seems a particularly ill-fated time to pass a tariff bill that avowedly reduces revenue by many millions.

*The
State
Legislatures.*

Of our forty-eight State and Territorial governments all have adopted the plan of regular biennial sessions of the legislature excepting Massachusetts, Rhode Island, New York, New Jersey and South Carolina, which still keep their ancient practice of assembling the law-making bodies every year. The Constitutional Convention of New York, which meets this year, will very probably decide that the Empire State shall go with the majority and try the plan of a session once in two years. It happens that the biennial sessions in

MR. BURROWS, OF MICHIGAN.

most States fall in the odd years. Thus in January, 1895, more than thirty legislatures will be sitting simultaneously. But a considerable number are now at work. Ohio usually sandwiches an extra session between the regular ones, and thus the law makers assemble every January at Columbus. The legislatures of New York, New Jersey and Mississippi assembled on January 2, those of Ohio and Kentucky having met on New Year's day. On January 3 the Solons of Massachusetts gathered under the gilt dome of the State House and heard Governor Greenhalge's eloquent inaugural. Maryland's law makers also met on the same day. On the 8th the legislatures of Iowa and Utah met. Virginia's legislature had already convened in December, and South Carolina's in November. Rhode Island's opening day is January 31. The other legislatures to meet regularly this year are

Louisiana's in May, those of Vermont and Georgia in October and Alabama's in November. The Colorado legislature, it should be added, has been called into extra session by Governor Waite.

The New York Law Makers. The legislature of the State of New York is controlled in both houses by the Republicans. The election last November was understood to mean a rebuke to Tammany and the Democratic State machine methods; and much was expected by the reformers from this legislature, especially for the rectification of New York City affairs. But the reformers are now fearing that their hopes were set too high, and that a Republican machine management of the legislature is not so zealous to destroy Tammany as to make deals with "the wigwam." The government of New York City from Albany will never be satisfactory, no matter what party or element may control the legislature. An improved ballot act,—the genuine Australian system,—is promised for the State, as is a fairer system of inspection at the polls. The assured reorganization of the New York City Police Board will at least result in some benefit. The mischievous interference in the affairs of Buffalo and other cities which the last legislature perpetrated to serve the transient political interest of individuals or cliques, will doubtless be atoned for by the present assembly. Fairly efficient

HON. J. C. CARTER,
President of the City Club of New York.

and satisfactory results may therefore be expected from the session. But the forthcoming meeting of the New Constitution makers will be of far more absorbing interest and of far deeper public concern than this session of the legislature.

The Struggle to Reform New Jersey.

The New Jersey legislature has been the scene of a disgraceful and protracted failure to organize the upper house. The people had arisen in their might to vote down the race track gamblers who had gained control of the Democratic machine, and had been governing the State. But that element does not yield easily, and it refused to permit the Republicans to organize the Senate, setting up its own members as a rump parliamentary body. There was nothing but folly in such a proceeding, for the Republicans were clearly entitled to control, and their success could only have been a matter of a few days or weeks. Fair play in these matters is never to be expected from the kind of men who have until lately held the State of New Jersey in their foul clutches. This reform legislature is destined to accomplish some memorable results before it adjourns.

Legislatures Beyond the Mississippi.

The Republicans of the Iowa legislature in caucus January 16 nominated Hon. John H. Gear to succeed Hon. James F. Wilson in the United States Senate. The nomination was, of course, equivalent to election. Mr. Gear has been in Iowa politics and in public office for many years, having filled the gubernatorial chair with honor and having served the Burlington district in Congress for several terms. He is the oldest Representative in the present Iowa delegation, and will be

Secretary Philadelphia Municipal League.

sixty-nine this year. Mr. Allison, whose colleague he will be in the Senate, is four years younger. The Utah legislature is naturally interested in matters that relate to Utah's approaching Statehood. The Colorado law makers are asked by Governor Waite to do a number of extraordinary things along the monetary and banking line, some of which would seem quite clearly to belong within the exclusive domain of the national government. The best judgment of Colorado seemed, so far as we can judge, to be greatly opposed to the holding of the extra session. Colorado and the other silver States, by the way, are regaining prosperity with a characteristic springiness, and having found that silver is not what the world most wants at present, they are producing gold for the insatiate "gold-bugs" of the East to an extent that at once surprises and greatly encourages them. Some day they will find that the fickle world of money and finance wants their silver once more at a good price. Meanwhile, let them turn to gold production with a vengeance.

*A Conference
on Municipal
Reform.*

The reform of municipal government is, happily, reaching the practical stage in our large American towns. Not that very much that the reformers have been asking for has actually been attained; but some progress can be claimed, public sentiment seems ripe for further steps, and the worst seems now to have been lived through. The conference on municipal reform called to assemble at Philadelphia on January 25 and 26 is evidence that a better order of things is dawning. The Municipal Reform League of Philadelphia took the initiative, and was joined by the City Club of New York in organizing the affair. The pro-

grammes included names of well-known reformers from Boston, Chicago, Milwaukee and other cities, as well as from New York and Philadelphia. Practical questions were set down for discussion, and it was assured well in advance that the conference would have great value as a stimulating influence. It is very important that American reformers should work out some more generally accepted body of views as to what are the best forms of organization for an American city, and what are the best ways to work

MR. EDMOND KELLY, OF NEW YORK,
Secretary of the City Club.

toward the ideal. The addresses and proceedings at this Philadelphia conference should be published in book form and sold at a low price for the benefit of urban dwellers everywhere.

AMERICAN PROPAGANDA BUILDING AT ANTWERP.

Ontario for Prohibition. The province of Ontario has by popular vote given a large majority in favor of the prohibition of the liquor traffic. This action by our high-spirited and splendidly administered Canadian neighbor comes at a time when temperance reformers in the United States look to prohibition as the ultimate solution of the drink evil with far less uniformity of agreement than ten or fifteen years ago. Will Ontario with her large towns manage to enforce prohibition to her own satisfaction and real benefit?

Her experiences henceforth will be watched with the world's keen interest. It is noteworthy that the city of Toronto itself voted strongly for the change, and that the result in Ontario is by no means a triumphing of rural over urban majorities.

The Antwerp Exposition.

The California Midwinter Exposition will prove a genuine success in itself undoubtedly, and a great advertisement for the Pacific Coast. But it is not to be the only great fair of 1894. It must divide honors with Antwerp, the great port of Belgium. The Antwerp International Exposition will open May 5 and continue until the middle of November. It promises to be a very attractive and creditable undertaking. It will not be on the scale of the Paris and Chicago Fairs, but it will be a very great undertaking, nevertheless. The accompanying illustration shows the general plan and arrangement of buildings. The American agency for this fair is in the hands of the so-called "American Propaganda,"—a company that has been formed to exhibit and promote American wares, products and inventions in other countries. The "Propaganda" have a fine American building at Antwerp, and it is hoped that American manufacturers and various States and communities may be adequately represented under its spacious roof. The building is to be made in such a way that it can be taken apart, transported and re-erected at other exhibitions or in different foreign cities as a special American show. The idea is a highly commendable one. Many of the most representative members of our Columbian Fair Commissions are enlisted as members of Belgium's American Committee to promote interest in the

PLAN OF ANTWERP INTERNATIONAL EXPOSITION.

Antwerp exposition. King Leopold is patron of the enterprise, and it is in strong and responsible hands.

*The Veterans
of 1894.*

It is so frequently asserted that this is the age of young men, that we have fallen into the habit of accepting the dictum as sound; but there is no particular justification for it. A little inquiry reveals the fact that not

only is the average length of life increasing, but also that the period in which men and women are capable of severe and continuous effort with full possession of their best faculties is undergoing a material prolongation. The causes for this

cheering fact tempt one to discussion of various modern improvements in the art of living; but it is sufficient to make the suggestion. The reader's mind will readily group the causative elements. It is merely our purpose here to remark that the world of statesmanship, of literature, of philanthropy, of moral and religious progress, of commerce, and of art, has reason to congratulate itself upon the array of veterans who have survived through 1893, and now live with the possibility before them of blessing the world by their active efforts or by their living presence through the year upon which we have entered.

BISMARCK, 79.

CAPRIVI, 63.

*Old Age
in States-
manship.*

Mr. Gladstone reached his eighty-fourth birthday on December 29. He spent the day in active command in the House of Commons. He has seldom passed through a year of more arduous labor than the one just ended. On the adjournment of the session, January 12, he went

with his devoted wife and other friends to Biarritz, on the Continent, to spend the short month of vacation

that intervenes before the opening of the new Parliamentary session on February 12. He must return to

DE GIERS, 74.

face another session of great struggle. He is a marvelous example of sustained power at great age. Prince Bismarck, though no longer in executive office, lives as an active and potent influence in the political affairs of Europe. In his old age he has virtually become the political editor of one or more daily newspapers. Through his private secretaries he makes his comments and expresses his views on the affairs of the day, and these jottings are communicated to the editors of the so-called Bismarckian organs, who carry out in detail the hints, instructions and lines of policy suggested by this matchless old diplomat and statesman. Bismarck was born on April 1, 1815, and is therefore now only fourteen months short of full 80 years. Count Caprivi, Bismarck's successor as Chancellor, is counted a comparatively young man; but a generation or two ago he would have been thought

old. He will be 63 this month. The leading statesman of Russia is Nicholas Carlovitch de Giers, Prime Minister and Minister of Foreign Affairs. The Emperor has within a few days conferred upon him the highest decoration in the gift of the Russian monarch and commended him warmly for his foreign policy. M. de Giers is in his seventy-fourth year. Another wonderful old Prime Minister is Francesco Crispi, who has within a few weeks been recalled from retirement to pilot Italy through difficulties to which no younger man's strength was equal. Crispi has begun his administrative work with a vigor unimpaired by age, although in the present year he will celebrate his seventy-fifth birthday. The men at the helm in the two halves of the Austro-Hungarian empire at the present time are comparatively young,—Count Windischgrätz, in Austria, and Dr. Weckerle, the Prime Minister of Hungary, being men in the prime of early middle life. The Emperor Francis Joseph himself, though this is the forty-fifth year of his

that intervenes before the opening of the new Parliamentary session on February 12. He must return to face another session of great struggle. He is a marvelous example of sustained power at great age. Prince Bismarck, though no longer in executive office, lives as an active and potent influence in the political affairs of Europe. In his old age he has virtually become the political editor of one or more daily newspapers. Through his private secretaries he makes his comments

CRISPI, 75.

reign, will not be sixty-five years old until next year. The affairs of the Austro-Hungarian empire continue, however, to be influenced not only by the past achievements but also by the present opinions of an

EMPEROR FRANCIS JOSEPH, 64.

old man who is now a nonogenarian. Louis Kossuth will be ninety-two years old if his life be spared until April 27. Dispatches from northern Italy, where he now makes his home, have of late indicated a very serious failure of his strength, but it is said that he is still able to take daily walks. To Americans his career has always been an inspiring and heroic one. Pope Leo, who is at once a European statesman of the first rank and a great religious leader, is now in his eighty-fourth year. Queen Victoria, whose personal influence has a real weight in the affairs of the British empire and of Europe, and who is one of the most accurately informed political personages of the day, has now reigned nearly fifty-eight years and is nearly seventy-five years old. Mr. Gladstone's most warlike coadjutor is Sir William Harcourt, already in his sixty-seventh year. The Chief Justice of England, Lord Coleridge, seems little beyond the prime of his abilities, although now in his seventy-third year. To note a few other political personalities in England it may be remarked that Sir James Bacon, the jurist, still survives in his ninety-sixth year; that Earl Grey, the famous statesman, is living and is ninety-one; that Lord Armstrong, who makes England's great guns, is nearly eighty-four; that Sir James Caird is

POPE LEO XIII, 84.

in his seventy-eighth year, Sir Austin Layard in his seventy-seventh, Lord Playfair and the Duke of Cambridge, like Queen Victoria, in their seventy-fifth year, and the Duke of Argyle and Mr. Thomas Hughes in their seventy-first year, while various others might be listed. The British colonies may also boast their political veterans still in the harness and actively at work, among

SIR HENRY PARKES, 79.

whom are Sir Henry Parkes, of Australia, in his seventy-ninth year, and Sir Charles Tupper, of Canada, in his seventy-third.

*Old Men in
American
Politics.*

Nor do young men hold a monopoly of political influence or public preferment in the United States. President Cleveland has somehow generally been accounted a young man in high office, but it should be remembered that he is nearly fifty-seven. Senator Morrill, of Vermont, serves his country ably at the ripe age of eighty-three, and Ex-Senator Payne, now in private life but recently in Congress, is also in his eighty-fourth year. Ex-Senators Evarts and Wade Hampton are approaching seventy-six. The famous Neal Dow, of Maine, is still busy and influential in his ninetieth year. Among the old men

KOSSUTH, 92.

who have retired but still survive are Robert C. Winthrop, in his eighty-sixth year, Ex-Secretary Hugh McCulloch in his eighty-fifth, Ex-Senator Thurman in his eighty-first, and Ex-Senator Dawes in his seventy-eighth. Besides Mr. Morrill, of Vermont, the United States Senate contains several men who may be said to have lived long enough to know something of the course of their country's history. Senator Harris, of Tennessee, is in his seventy-sixth year. Senator Sherman, of Ohio, is about seventy-two. Senator Palmer, of Illinois, is in his seventy-eighth year. Senator Colquitt, of Georgia, and Senator Morgan, of Alabama, are in their seventy-first year, while Senator Pugh, of Alabama, is in his seventy-fourth. Senators Hawley and Platt of Connecticut, Voorhees and Turpie of Indiana, Hoar of Massachusetts, Stockbridge of Michigan, George of Mississippi, Stewart of Nevada, and Ransom of North Carolina, are all within two or three years of seventy, and Senator Hunton of Virginia is in his seventy-second year. The remaining Senators average about sixty years old. There are eighty-eight seats in the Senate, and the very youngest man in the body is Mr. Irby, of South Carolina, who is just turning forty. The oldest member of the House of Representatives is Hezekiah S. Bundy, of Ohio, who has very lately taken his seat, having been elected in November to fill a vacancy caused by the death of Mr. Enochs. Mr. Bundy is in his seventy-seventh year.

The title "Father of the House" belonged until a few weeks ago to Mr. Charles O'Neill, of the Second Pennsylvania district, whose death occurred on November 25. This title is not conferred upon the oldest member, but upon the one who has seen the longest continuous service. Mr. O'Neill was about seventy-three years old. The title "Father of the House" now belongs to Mr. Holman, of Indiana, who is a veteran both in years and in public service, though he would not be an old man in the Senate. He is in his seventy-third year. The present House has a remarkably long list of comparatively young men. Thomas Dunn English, of New Jersey, is in his seventy-fifth year, but he is a very exceptional instance. Mr. Houk, of Ohio, will be seventy next year, but most of his Ohio colleagues are much younger. Congressman Lily, of Pennsylvania, was born in the same year as his late colleague Mr. O'Neill. But in all the great Pennsylvania delegation there is not another man as old as sixty, and there are only three or four who are within two or three years of that age. In the New York delegation General Sickles is already seventy, Mr. Belden, of Syracuse, will be seventy next year, Mr. Daniels, of Buffalo, the year following, and Mr. Schermerhorn, of Schenectady, in still the next year. All the other New York Congressmen are considerably younger. The oldest member from Massachusetts is Mr. Randall, of New Bedford, now in his seventieth year, while Mr. Stevens, of North Andover, is one year younger. Mr. Walker, of Worcester, is sixty-five. Next in seniority are Mr. Cogswell and Schoolmaster Everett, respectively nine and ten years younger than Mr. Walker. The House of Representatives is a turbulent place, and its term of two years is so short that old men naturally prefer to keep out of the hurly burly of five hot campaigns for renomination and re-election in a single decade. But the list of State Governors, if scanned with reference to the ages of the gentlemen now holding these dignified positions, would show very decided maturity. Upon the whole it is clear that the world of statesmanship and public affairs could not well dispense with its men who have passed the line of three score, while if all who are beyond the limit of three score years and ten should be suddenly relegated to private life the world would suffer a great loss. It is quite possible that there may develop a common practice of devoting young and middle life to private affairs, and old age to the affairs of the community.

SUSAN B. ANTHONY, 74.

Our Surviving Benefactors.

In one of the latest of the numerous published outlines of proposed socialistic utopias, it is provided that all men shall be compulsorily removed from professional and industrial life at forty. This scheme declares that men and women from thirty-three to forty shall be "teachers, scientists, managers, doctors, or fill any calling requiring age and experience to insure proficiency and success." Then they must step down and out. It is true that most of the world's best workers have accomplished much before the age of forty, and have shown the stuff of which they were made. But this century would have been shorn of most of its best achievements if its workers had gone into

HARRIET BEECHER STOWE, 82.

senile retirement at such an age. We have just named some of the men of advanced years who are still potent in the world's political life. In scholarship and letters, and in all the professional walks of life, old men and old women in our decade have been holding the palm. Since 1890 death has sadly thinned the ranks of the most illustrious of the world's aged workers and benefactors; but many still remain with us in this year of grace 1894. Thus in this country the old age of the Field brothers is something to be grateful for. David Dudley Field has until very

JULIA WARD HOWE, 75.

lately kept up his valuable public work, and is now in his eighty-ninth year. Justice Field still serves his country on its Supreme Bench in his seventy-eighth year. Dr. Henry M. Field, in his seventy-second year, has just given us a delightful new book of travel relating to the north coast of Africa, which will be found noticed among our books of the month. Several members of the Beecher family still live. Mrs.

Harriet Beecher Stowe is in her eighty-second year. Dr. Edward Beecher, who was born in 1804, has carried on active and useful work to the great age of ninety. Rev. Charles Beecher will be eighty years old next year. Dr. Thomas K. Beecher, of Elmira, keeps the fire and the force of his youth at seventy. Mrs. Isabella Beecher Hooker is prominent and useful in

the reforms which interest her at a good old age. Henry Ward Beecher would have been nearly eighty-two if he had survived until this time. His wife, who was of the same age, still lives, and in these last years her pen has been almost constantly busy, and her influence and usefulness have steadily

COUNT DE LESSEPS, 89.

grown. Oliver Wendell Holmes in his eighty-fifth year is still our leading man of letters. Ex-President McCosh, of Princeton, in his eighty-third year, is no longer active, but until lately his current interest in the religious and philosophical movements of the day has been made manifest. Professor Dana, the geologist, is past eighty. Park Godwin, the veteran journalist, is in his seventy-eighth year, and his voice is still heard from time to time in favor of the causes he has

PROF. RICHARD DANA, 80.

long championed. Mrs. Julia Ward Howe, who will be seventy-five this year, lives in the present as actively as ever. W. W. Story, author and sculptor, is of the same age. Miss Susan B. Anthony, in her seventy-fourth year, lives to rejoice in the news from Colorado and New Zealand. Dr. Edward Everett Hale, of the same age as Dr. Henry M. Field, continues to be the most active and busy man in Boston, serving his country as man of letters, editor, theologian, preacher and philanthropist. Thomas Wentworth Higginson has completed his seventieth year, and could not well be spared from the ranks of literature, journalism and oratory. Professor Goldwin Smith,—of Toronto, and of the English-speaking world,—is now at the very height of his literary activity, and he was seventy at his last birthday. To take a glance across the water, one finds in France Bartolémy Sainte Hilaire and Ferdinand De Lesseps still living and both in their eighty-ninth year. Of the same age in England is James Martineau, the eminent philosopher and religious leader, and George Müller, greatest of the friends of homeless children. Professor Blackie, at Edinburgh, is as active at eighty-five as many a man at forty. Samuel Smiles, whose books have helped so many of his juniors, is now at work on some

of the most important of his literary undertakings in his eighty-seventh year. Bessemer, the inventor of cheap processes of making steel, is still living and about eighty-three years old. Ernst Curtius lives and works in his eightieth year. Verdi at the same age has been producing new operas. The Baroness Burdett Coutts, also in her eightieth year, is still full of the spirit of social reform and of philanthropic activity. Of the following list of eminent people of Europe, the youngest is in his seventy-fifth year, while most of them are two or three years older: The historians Rawlinson, Mommsen, and Froude: Leon Say and Dr. Brown-Séquard of Paris; John Ruskin, Sir Monier Williams, Baron Reuter, the Prince de Joinville, Gustav Freytag the novelist, and Professor Bain the scientist. Mr. Herbert Spencer is in his seventy-fourth year, as was also his warm friend Professor Tyndall, of whose finished career Mr. Grant Allen has written for our readers this month. Alfred

OLIVER WENDELL HOLMES, 85.

R. Wallace, another great English scientist, is in his seventy-second year; Professor Helmholtz, the leading physiologist of the age, is approaching seventy-three; Professor Virchow is working hard at that same advanced age, as are Dr. Max Muller, who is past seventy, and Professor Huggins, the great astronomer, who is in his seventieth year; Professor Huxley, who is in his sixty-ninth year; M. Pasteur, who is in his seventy-second year;

Dr. George McDonald, the novelist, who is in his seventieth year. And many other men of note, who are still active contributors to the world's literary or scientific progress, have attained that age. It is pleasant to be reminded that Florence Nightingale is still living in her seventy-fourth year, as also is Jean Ingelow, the poet, at the same age,—this being the age of Susan B. Anthony and of the comedienne Mrs. Gilbert. Mrs. John Drew, the comedienne, is two years older, and is now at seventy-six nightly entertaining audiences in New York. Rosa Bonheur is in her seventy-second year, while Mrs. Oliphant, who continues with brief intermissions to give us charming new books, is not yet quite sixty-six.

DR. M'COSH, 83.

But it is not necessary to prolong the list. Let us be thankful for the veterans who still survive and to whom we are so deeply indebted. In the hurry and bustle of our decade, we are reminded when we survey the long line of famous men and women whose services have been of continuous value to the world through periods of from forty to sixty years, that it is not needful to attempt to accomplish one's life work in consuming haste, and that it is highly important to learn a true economy of vital resources, so that one may prolong his activities and enjoy the benefits of ripened experience for the later parts of his career. The experience of such veterans as Gladstone, Blackie and Dr. Holmes upon the best way to combine hard and effective work with the preservation of power to a great age is worth the careful attention of every young man.

Lords and Commons at Loggerheads.

Parliament adjourned on January 12 for one month. The session was chiefly remarkable for the antagonisms that it developed between the two houses. The Employers' Liability bill was one of the chief topics of disagreement. Clause 4 of the bill, as it left the Commons, forbade "contracting out." In committee in the Upper House, Lord Dudley moved an amendment exempting from this prohibition any agreement already in existence and approved on a special ballot by a majority of the workmen, as also any agreement formed after the passing of the act, accepted on a ballot by a majority of the workmen, and in certain points approved by the Board of Trade. This was a much stronger amendment than Mr. W. McLaren's, which had been defeated in the Commons by 236 to 217. Mr. McLaren wished to exempt only those firms (with their successors) which had already made agreements with their workmen, such as, for instance, the London and North Western Railway Company, the London, Brighton and South Coast Company, Sir William Armstrong and Company. He did not propose to extend the exemption to the future agreements of other firms. Those who would allow "contracting out" pleaded for the liberty of the workmen to choose the system they preferred, and affirmed that the agreements already existing under the firms named were strongly preferred by the workmen. To refuse this liberty would, it was said, be to replace free and friendly by legal and litigious relations. On the other hand, it was argued that the provision made by law, whether for the direct or indirect protection of life or limb, was not a thing to be contracted out of, however desirous some citizens might be for such exemption, and that the workman, if legally free to choose either system, might be practically compelled to vote away his right to the indirect protection afforded by his master's legal liability. It was pointed out that the Trades Union leaders and Labor members, who might be supposed to know the mind of the working-classes, went solidly against the principle of "contracting out." The Peers inserted Lord Dudley's amendment by 148 to 28. When the Commons came to consider this with other of the Lords'

amendments they peremptorily rejected it by 213 to 151, Mr. McLaren now voting with the majority.

The Betterment Deadlock.

Then there was the deadlock on "Betterment." "Betterment," it should be explained, is the word used in England to describe the familiar American plan of charging part of the cost of a public improvement against the private property that it benefits. Earlier in the session the Lords had rejected the principle of betterment as embodied in a London Improvements bill sent up from the Commons, and on the Commons reinserting it had rejected it again. Under these circumstances, the London County Council declined to proceed with the improvements. About the end of November the Peers proposed the formation of a committee of both Houses to consider whether the principle of betterment were equitable, and if so, how applicable? The Government refused to assent to this proposal. On December 11 Sir John Lubbock appealed to the Government to relent, that the question might be reasonably and amicably settled. Mr. Chamberlain pressed the Government to grant the Lords a *locus pœnitentiæ*. But the Government was inexorable. Sir John's motion was defeated by 177 to 139. The responsibility for the consequences remains—with the Peers, say Ministers;—with Ministers, say the Peers. Meanwhile "the urgently needed improvements" in London remain unexecuted.

Indecisive Bye-Elections.

What the Lords will finally do with the contracting-out clause is yet to be seen. Trades Union deputations have waited on Lord Salisbury to press on him what they hold to be the desire of the working classes. The Accrington election has not uttered a verdict on the question quite as unmistakable as either party desired. The vacancy was caused by Mr. Leese's having to seek re-election in consequence of his acceptance of the Recordership of Manchester. He was opposed by Mr. Hermon Hodge (Conservative). The tactics of the Labor party showed a lack of unity. A Socialist candidate came forward, then withdrew. Then Mr. Keir Hardie advised the workingmen to abstain from voting. Mr. John Burns forcibly pointed out the evil of abstention. In answer to a charge of "wobbling," Mr. Hermon Hodge declared that while favoring the prohibition of contracting out as a general principle, he fully accorded with the House of Lords in this particular instance. Mr. Leese's return by a majority of 258—less than half the majority (547) by which he won last election against the same opponent—brings no great encouragement to the Government. At Brighton, where Mr. Bruce Wentworth succeeds Sir Thomas Marriott (resigned) as junior Conservative member, there was no contest. The struggle at Horn-castle, rendered vacant by the sudden death of Mr. Stanhope, late Secretary for War, was more exciting, and it was expected to show how agricultural laborers were thinking of the way the Parish Councils bill was being dealt with. But the Conservative tradi-

tions of Lincolnshire were not yet to be overcome. Both parties polled heavier votes than at the general election, and Lord Willoughby d'Eresby, the Unionist, prevailed over his Gladstonian antagonist.

THE LATE RIGHT HON. EDWARD STANHOPE, M.P.

*The Parish
Councils
Bill.*

With the principle of this bill all parties professed their agreement, but for all that the measure crawled through the House of Commons clause by clause at a pace as slow as though it contained purely party proposals of the most contentious kind. Over Clause 13, which dealt with the administration of parochial non-ecclesiastical charities, was waged a protracted battle. The Government, who had promised not to remove existing trustees from the control of these charities, accepted Mr. Cobb's amendment that the parish council should in such cases appoint additional trustees numerous enough to place in a majority the trustees elected by the inhabitants of the parish. By this change the non-elective trustees are not removed, but swamped. Mr. Cobb's sub-section was carried by 109 to 48, and the entire clause—further modified in a Radical direction—by 143 to 90. But the most determined stand was made by the Opposition against Clause 19. At present the rural sanitary business of a union is done by the rural members of the Board of Guardians, on which resident county justices sit *ex officio*. In reforming the government of the parish, Ministers felt they could not leave unreformed the local sanitary authority. Hence they proposed to abolish *ex officio* guardians and plural voting, and to take elections by ballot. This projected abolition of the last refuge of non-elective local government naturally excited the most determined hostility from the Opposition. The reform of Poor Law administration, it was urged, required to be dealt with separately in its entirety, and should not be thus brought in, fragmentarily and as it were surreptitiously, in a subordinate

clause of another and independent measure. On the Government refusing to drop this highly contentious matter, the Opposition adopted tactics which unfriendly critics described as obstructive. As a result, England had the almost unprecedented spectacle of Parliament sitting in Christmas week, and of Mr. Gladstone in the House on his birthday. The reception then extended from all parts of the House to the incomparable old man of eighty-four years was a gleam of light in an otherwise extremely sombre parliamentary situation. There are now rumors of attempts at conciliation and compromise, varied with threats of vigorous closure, and fondly fostered hints of a speedy dissolution. Thanks to a compromise arranged by Mr. Gladstone and Mr. Balfour, the bill passed on January 12, and adjournment promptly followed. The Lords must next pass upon it.

*Getting
Ready for
Next Session.*

Already the coming session casts its shadow before it. Mr. Gladstone has promised a Royal Commission to consider the financial relations which should prevail between Great Britain and Ireland under Home Rule. He assured a strong temperance deputation on December 7 of the Government's intention resolutely to push for-

THE BISHOP OF CHESTER.

ward the Local Veto bill. Taken along with other pledges equally emphatic, this means heavy fighting. While the out-and-out temperance people are mustering their forces in support of the unqualified veto, the supporters of the Scandinavian system, headed by the Bishop of Chester, the Duke of Westminster and Mr. Chamberlain, are preparing for organized political

action. In this connection it is interesting to note that the local option measure passed a few months ago by the New Zealand legislature gives to the resident electors (who now include women) the choice of increasing licenses at a maximum rate of one for every seven hundred of increased population, or of reducing them by at most one-fourth, as well as of merely renewing or totally refusing to renew existing licenses. For mere renewal or for reduction a simple majority is enough: for increase or total refusal a three-fifths majority is requisite. Some such variety of alternatives would probably stand a better chance of passing the home Parliament than the option of veto now proposed. Meanwhile, Sir William Harcourt is spending the recess upon the national budget. He has to meet the problem of revising the revenues to cover a heavy deficit.

English Naval Scares. The prospects of the Gladstone Government are not improved by the effect which the great coal struggle must have produced on the national finances, and the budget will have to include provision for the augmented naval expenditure for which the country has made an imperative and all but unanimous demand. It may be questioned whether the impressiveness of this unanimity has not been somewhat impaired by Lord George Hamilton's motion and the ensuing debate. He pressed for a statement of the Government's intentions with the hope of securing immediate action. To keep abreast of the combined fleets of France and Russia, England should, he urged, at once augment the number of ships a-building. The resolution, which the Government treated as a vote of want of confidence, was defeated by a strictly party vote of 240 to 204. The fear is that Ministers, being thrown on the defensive, may have persuaded themselves into an optimism which will reduce their activity, and may consider this view of the situation confirmed by the vote of Parliament. The Lords of the Admiralty protested against the Chancellor of the Exchequer's speech on the question. The recurrence of these naval scares is deprecated. Among other evils they produce, they stimulate just that naval activity on the part of possible enemies which it is England's wisest policy to suffer to sink into quiescence. Better, of course, have a scare now and then than lose the command of the sea; but the scare is a weapon to be used only in the last resort. What is wanted is a steady, unobtrusive development of naval power which shall be equal to increasing needs. If Sir William Harcourt, undeterred by a shrinking revenue, boldly asks the nation for adequate means to this end, he will evidently have chosen the popular course. Few things in this discussion have been more significant than that Mr. Keir Hardie, among his proposals to find work for the unemployed, should have urged the building of more fast cruisers for the navy. Time was when orators of the Little England school used to suppose that "bloated armaments" was a term of abuse as acceptable to working-class audiences as "bloated aristocrat." The new democracy knows better. The very bread that it eats comes from over sea, and were that

door closed it can guess the consequences. When Cannon street and Canning town agree in demanding a larger navy, the policy of the Government is plain.

The Unemployed in England. The sufferings of the unemployed in England, if not greater, are at least more vocal than ever, and remarkably various are the remedies proposed. Besides the project already named, Mr. Keir Hardie suggested to Parliament the establishment of an eight hours day and the prohibition of overtime in Government factories, the reclamation of waste lands and foreshores, the re-forestation of the country, and the provision of suitable accommodation for the aged poor. The *Daily Chronicle* revives an old scheme for reclaiming the Wash, and so adding a "new county" to England. Mr. Chamberlain's hope is for extended markets for national trade. A conference of vestries, presided over by Lord Onslow, proposed to Mr. Gladstone the formation of light railways, made and worked as in Ireland, to carry away the refuse of London. The gravity of this problem throughout the United Kingdom can hardly be overestimated, and its conditions are not so transient as those in the United States. There is no such "army of unemployed" in Chicago or New York as in London.

M. DUPUY,
President of the French Chamber.

The Anarchists and French Affairs. Vaillant, the bomb-thrower of the French Chamber, has been found guilty by a jury and sentenced to death. This prompt action will be salutary. In Spain, the Anarchist conspiracy concerned in the Barcelona outrages has been disclosed to the police by the information of a little girl of eight years, and the crime brought home to the bomb-thrower. Repressive laws and banishment are driving foreign Anarchists to London. The English indigenous development of Anarchism is so mild as almost to provoke a smile by contrast with the Continental variety. While on the

Continent they have bombs exploding in Opera House and Legislative Chamber, in London the British Anarchists vainly try to hold a meeting in Trafalgar Square, or hold a conference Christmas week, declaring that while all means are justifiable, their chief aim is educational, and wind up the evening with a ball! It is reassuring to observe from the antecedents of such men as Vaillant that the bomb-thrower does not seem to be recruited from the ranks of the despairing unemployed. Vaillant is said to have given up his employment on receiving a round sum down, in order to bombard the Chamber. Nevertheless, Anarchism is a symptom, if not a direct product, of the maladjustment of social conditions; and one may hope that the French Premier's promise, made five days before the bomb appeared, to combat Socialism "not with disdain, but by the fruitful action of the State," may not be now abandoned. Illustrative of the new tendency in French politics are the proposals of M. Goblet, the leader of the Socialist-Radical party, for taking over to the State on payment of half their value all mines at which a strike has lasted for over two months. A standing committee has been appointed by the Chamber to consider all measures introduced relating to labor. M. Clémenceau's "revelations" of inefficiency in the French Navy synchronize rather humorously with England's nervous dread of Franco-Russian ascendancy at sea. Britain's lively neighbors banter her on having just discovered the existence of Toulon, which last month celebrated the centenary of its recapture from the British by Napoleon. Another comic element in this connection is the alleged unwillingness of the Czar to let his ships of war frequent French ports for fear of officers and marines becoming infected with republican ideas. Democracy is so catching.

SIR PHILIP CURRIE, G.C.B.,
New British Ambassador at Constantinople.

Matters in Mid-Europe. Russia's tariff war with Germany is said to be nearly at an end, negotiations having proved successful. The treaties of commerce approved by the Reichstag with Spain, Servia

and Roumania extend the Mid-European area of modified free trade. The passing of the first paragraph of Count Hompesch's bill for the readmission of the Jesuits into Germany marks another victory for the Pope. The Duke of Edinburgh, who, as Duke of Saxe-Coburg, is now the sovereign of a German State, has, while renouncing an earlier grant from the British Parliament of £15,000, notified his intention of retaining the £10,000 a year marriage settlement. Mr. Gladstone discourages inquiry into the grounds of this arrangement; but it raises a nice question as to the precise status of the Duke. Is he a foreign sovereign, or British subject, or both, or a *tertium quid* to be known in Ministerial parlance as a *persona designata*?

Ferment in Austria.

Austria still seethes with excited expectancy over the promise now withdrawn of universal suffrage for the adult male. A great meeting of women in Vienna has demanded the extension of the franchise to women also. Alarmists declare that if the vote be withheld from the people the army will fight to obtain it. A more peaceful sign was the definite adoption by Austrian Socialism, at its recent Congress, of trades union methods; while a conference of farmers and peasants has formulated a series of economic demands on the Government. Particularism of the petty kind is evidently fading in the dawn of industrial democracy.

Signor Crispi at Work.

Liked or not liked, Crispi seems to be the one Minister who has backbone and on whom Italy feels that she can rely. His policy of trying to make Italy a great power is credited with her present disasters, and there is a dash of poetic justice in calling on him to remedy the mischief. He has begun his difficult task with much spirit and dignity. He calls for "a truce of God" among rival parties, and sets the patriotic example of declaring himself to be of no party. His programme combines measures of retrenchment and increased taxation. News of a victory in Abyssinia on the 21st, won by a garrison of 1,500 Italians near Massowah over some 10,000 Dervishes, came at the right time to put heart for awhile into the country. But a debt of over \$2,500,000,000, with the annual drain of military and naval expenditure, is a terrible load to carry. One cannot wonder at riots against octroi duties breaking out in Sicily, which only troops could quell. The half-despairing struggles of Italy, the insolvency of Greece, the rumored imminence of national bankruptcy in Servia, are signs that the present European strain is nearing breaking-point.

"England the Lightning Conductor?"

Is war the only way out? Certainly not. Another opening seems to be showing, which, however disagreeable for England, offers prospect of European peace. The Franco-Russian alliance, taken with the commentary of recent negotiations at Cabul and Bangkok, has awakened on the Continent the feeling that that alliance is directed, not against the Triple Alliance, but

against Great Britain. This feeling, right or wrong, has produced a sensation of relief. The members of the Triple Alliance, having in vain sought British adhesion, are said to cherish a mild sort of satisfaction on seeing the danger they dreaded shunted on Great Britain. Now, if France be of this persuasion, and train herself to think more and more exclusively of "perfidious Albion" as her foe, then she may, especially under the constant irritation of British commercial and colonial rivalry, learn to assuage if not to forget her hatred of Germany. Hatred of England is less of a threat to the world's peace than hatred of Germany. And the Czar's aversion to war will tend to restrict French hostility to the limits of sentiment and speech. Of this we may perhaps see proof in the amicable arrangements being made for the formation of Mekong as a buffer-state between French and English boundaries in the far East. If China kindly consents to take over this pacific interstice, that will

MR. J. G. SCOTT.

British Chargé d'Affaires at Bangkok.

close one possible source of grave danger. A further fear has been suggested. May not the Triple Alliance not merely watch with benevolent interest the anti-British attitude said to have been assumed by France and Russia, but actually combine with them in a Quintuple Alliance? Well, even the prospect of a European coalition against England may also work for peace. Perhaps a menace of this kind may be needed to rouse the English-speaking States all round the world to a sense of their brotherhood and common destiny.

Mr. Rhodes' Christmas Message.

In South Africa the struggle is declared to be over. The terrible slaughter in the first two or three battles seems to have broken the warlike spirit of the Matabele. They have been making their submission and surrendering their arms. They are told to settle down peaceably and till the soil. The pursuit of Lobengula was attended by an incident that causes deep grief everywhere, mystery and anxiety. Captain Wilson and a

detachment of thirty-five men got ahead of the main body of pursuers under Major Forbes. The former crossed the Shangani and came up on December 4

MAJOR P. W. FORBES,

Commanding the Salisbury column.

with the retreating King. A fight ensued, the Matabele fled, Lobengula on horseback. The rising of the river prevented Captain Wilson rejoining Major Forbes. He continued to pursue Lobengula; but that wily savage led him into a trap or ambush of some kind, and the whole detachment died fighting bravely, like Custer on our own plains. The news was slow in coming, but it is not doubted. Thus ends another of the unhappy wars between savages

MAJOR ALLAN WILSON, OF THE BRITISH SOUTH AFRICAN FORCES.

and the pioneers of civilization. Dr. Jameson has begun to disband his troops and is organizing a police force. Mr. Rhodes, on his way back to Cape Town, arrived at Palapye on the afternoon of Christmas Day. And this was his Christmas dispatch: "All well. Matabele entirely subjugated. Lobengula has fled absolutely without intention to return."

RECORD OF CURRENT EVENTS.

December 19.—The Ways and Means Committee present to Congress their majority report on the Wilson bill ; it is not claimed to be free from protection ; it is put forth as merely a step toward tariff for revenue... The United States will not recognize a blockade nor Mello's forces as belligerents ; the cruisers "San Francisco" and "New York" ordered to Brazil....John A. Hopkins (Dem.) elected Mayor of Chicago....The Anarchist who threw the bomb in the Barcelona theatre caught ; he confesses ; a bomb exploded at Rakonitz, Bohemia ; an anti-Anarchist Congress proposed by European powers. ...England's naval needs anxiously discussed in the House of CommonsThe Mafia held responsible for the rioting in Sicily ; it will be broken up : 8,000 men will augment the forces on the island.

December 20.—Secretary Carlisle's report goes to Congress ; he estimates the deficit at the end of the year at \$28,000,000 and recommends an issue of bonds and a tax on incomes from corporate investments....Illegal tobacco tax refunds made in New York to the extent of \$1,000,000....Peixoto's men defeated and repulsed in an attempt to retake Governador Island....Storm raging in the English Channel, doing much damage to shipping.... A British fleet ordered to Bangkok....Anarchists compelled to leave Paris ; no prospect of immediate international co-operation for their suppression.

December 21.—Minority report of the Wilson bill presented to Congress....Sentiment in favor of establishing a republic in Hawaii said to be growing....St. Nicholas Bank of New York closed with a shortage of \$150,000.... Fire in Manchester involves a loss of \$2,500,000....Gladstone scores an important victory in a bye-election at Accrington....The conflict at Melilla settled by proposals from the Sultan's brother....Cholera spreading at St. Petersburg....Attacks on Caprivi becoming more bitter.

December 22.—Admiral Stanton will again take command at Rio ; the government holds all the Nichtheroy side of the harbor ; Da Gama's monarchist proclamation has hurt the insurgent cause....40,000 are idle in Brooklyn alone ; distress and suffering almost unparalleled.... Matabeles again badly beaten on December 4....The Italians overwhelm Mahdist forces in northern AbyssiniaThe Germans inflict a defeat on marauding natives in Damara Land.

December 23.—The Atchison, Topeka and Santa Fé Railroad placed in the hands of receivers....Our commerce blockaded at Rio ; situation of the Government party there improving ; insurgents outnumbered and the likelihood of their forces in Rio Bay being crushed increasing....Hard times felt severely at Berlin ; popular feeling in Germany aroused against the new revenue proposals....The formation of a buffer State, north of Siam, opposed in Paris....Trouble threatened between Turkey and Russia....British battleship "Resolution" damaged and nearly lost in a storm in the Bay of Biscay.

December 24.—Three Western trains held up by masked robbers ; many valuables taken....Caprivi, tired of the abuse heaped upon him, is said to have threatened to resign ...Greece has defaulted on the interest of her gold loan of 1890 ; the powers may compel her to pay....The assassination of the police spy Mvra in Bohemia by young Czechs, will result in the enforcement of the stringent repressive measures against sedition passed by the Reichsrath... France will begin to fortify her northeastern

frontier to offset Germany's camp at Malmédy....Troops about to leave Melilla.

December 25.—Gov. Fishback of Arkansas demands that the government take possession of the Indian Territory and rid it of its criminals....Christmas brings little alleviation to the distress among the poor....Greeks call upon King George to dismiss Premier Tricoupis ; his financial policy exciting distrust and protest....Anarchists arrested at Barcelona.

December 26.—Florida militia ordered out to quell negro riots....The cruiser "New York" departs for Rio

HON. WAYNE M'VEAGH,
United States Ambassador to Italy.

....A stay granted John Y. McKane....Sicilian anti-tax riots spreading and growing more serious throughout the island....Da Gama is in a critical position in Rio Bay.... Rioting in Amsterdam between the police and unemployed workmen....Great Britain will seize the Gilbert Islands ...Sweden will use force, if necessary, to preserve the Scandinavian Union.

December 27.—The deficit in the municipal treasury of Chicago will amount to \$3,000,000....Senator Morgan's sub-committee on Hawaiian affairs begins its investigations....The Cherokee strip bonds sold to a St. Louis syndicate....The National Treasury balance still declining ... New York and New England Railroad placed in the hands of receivers....Many marine disasters off the En-

glish coast....Rioting and fighting going on in two interior towns of Sicily.

December 28.—Havrians have fired on the U. S. flag and the "Kearsarge" ordered to San Domingo to demand redress....Rolling stock of the New England Railroad tied up by an attachment....Carnegie has offered to duplicate for two months each day's subscription for the unemployed in Pittsburgh; 100,000 wage earners out of work in that city alone....The insurgent cruiser "Almirante Tamandare" sunk in Rio Bay....All Sicily in a ferment of riot....Two Rif chiefs seized by Muley Araaf and surrendered to Gen. Campos; they will be sent to the Sultan at Tangier....Military police in the Cameroons have revolted.

December 29.—Prendergast, the murderer of Mayor Harrison, convicted; his punishment fixed at death....Flower will be renominated for Governor in New York....Three receivers named for the New England Railroad....Demonstrations made in Sicily against the administration of the *octroi*; Crispi will undertake the task of pacification....Report that Capt. Wilson's forces were annihilated by the Matabele confirmed.

December 30.—The Committee on Foreign Affairs hands in its minority report on the Hawaiian case....Populists will not support the Wilson bill....St. Louis will undertake the suppression of the social evil, according to Parkhurst methods in New York....The British Government will concede to the popular demand for a liberal naval policy....Sicily is in full revolution; no progress made in quieting the turmoil; brigandage on the increase.

December 31.—The whole of Danbury, Conn., is affected by the long lockout....Ex-Senator Thos. C. Platt shows himself master of the New York Republican machine....Kaiser Wilhelm will again dissolve the Reichstag if its temper proves contrary to his policy; rumors of dissension among members of the Ministry; Berlin buying Italian securities....Sicilian troubles claimed to be due to the misconduct of officials....Riffians sue for peace....Dynamite explosion at Athens, Greece.

January 1, 1894.—The Manchester Ship Canal formally opened....The President holds a brilliant New Year reception....A number of railroad and trolley accidents occur....Crispi sends a representative to Sicily and will soon follow, himself....Peixoto has purchased five torpedo boats....The police of France search 10,000 houses for Anarchists, resulting in a number of arrests and the discovery of bombs and fuses.

January 2.—The Ways and Means Committee favor a two per cent. income tax, incomes under \$4,000 being exempt....Chili refuses to grant an extension of time for the consideration of claims submitted to the joint committee for adjudication....John Y. McKane elected president *pro-tem.* of Kings County supervisors; Governor Flower sends his message to the Legislature; the State entirely free from debt....The Pennsylvania Railroad acquires the Vandalia; the Illinois Central, the Chesapeake, Ohio and Southwestern....A number of men killed and injured in a wreck on the Union Pacific, near Kansas City....Da Gama issues a proclamation declaring that his previous one was not a monarchist document....Serious trouble becoming manifest in the large towns of Sicily....Stories of Kossack outrages upon Catholics at Krosche, Russia, in November confirmed....Peace restored in the Cameroons....More Anarchist arrests in France; seditious documents seized in Bohemia.

January 3.—Grain elevators and office buildings in

Toledo, to the value of \$1,000,000, destroyed by fire; the militia called out....A bank at Dixon, Ill., blown up by dynamite and looted of \$15,000....Work for many of the unemployed provided by department officials of New York City; hard times severely felt in Great Britain....Barcelona Anarchists turned over to military authorities; many people arrested in France who cannot be held....All quiet in Brazil.

January 4.—The President and Cabinet opposed to the proposed income tax....The Louisville, Evansville and St. Louis Railroad placed in the hands of receivers; Atchison receivers explain the reasons for their appointment....Mills through the Naugatuck Valley, Conn., idle....A blizzard raging in Europe from the Baltic to the Adriatic....A state of siege proclaimed in Sicily....It is reported that Premier Rhodes threatens, unless he is allowed a free hand, to set up an independent government in South Africa; the Bartotse will prevent Lobengula's crossing the Zambesi; trouble brewing in Uganda among the Arabs.

January 5.—Democrats hold a caucus on the Wilson bill; ten extra days will be allowed for debate on the income tax....The cutter "Corwin" arrives in San Francisco, with dispatches from Hawaii; rumors of the Queen's restoration....Camden mills shut down....A British captain and twenty-six soldiers killed by French troops in Northeast Africa, probably through some mistake....Great Britain will begin immediately the construction of 27 and France of 32 war ships of all classes....Rebels lose a battle in Brazil....Many deaths caused by the blizzard in Europe....Gourko is dying.

January 6.—Minister Willis has called upon the Provisional Government of Hawaii to resign....4,500 out of 6,000 pension claims in Buffalo found to be fraudulent; the full amount of the swindle may reach \$1,000,000....Democrats still unable to gather a quorum to push the Wilson bill....Leaders of the insurrection in many towns in Sicily arrested; Deputy de Felice's house searched and important Socialist documents found....Reforms will be instituted in the management of the Bank of England....Lobengula reaches the Zambesi.

January 7.—White Caps kill one man and severely whip several others near Harrodsburg, Ky....Elections in 189 Senatorial districts in France result in a large majority for Republicans; Floquet is returned....Anarchists add to the turmoil in Sicily; it is rumored that France is helping to stir up the insurrection....Da Gama declares in favor of a civil republican government....The quarrels between the German Chancellor and his Ministers of War and Finance settled provisionally.

January 8.—Fire destroys a number of World's Fair structures, among them the Peristyle and Liberal Arts; numbers of exhibits consumed in the latter....The Tariff bill brought before the House....Democrats will not join with Republicans in organizing the New Jersey Senate....Thousands of troops being poured into Sicily; damage by mobs estimated at more than \$6,000,000....Mello will co-operate with land forces in Southern Brazil; quiet reigns at Rio....Several hundred Anarchists arrested in Rome.

January 9.—New Jersey is in possession of two Senates, the Governor recognizing the Democratic, the Assembly the Republican; Gov. Werts' message recommends repeal of all race-track laws....The damage to exhibits in the World's Fair fire will not exceed \$200,000....Wilson finishes his speech on his tariff measure....Order is restored at Castelvetro, Sicily, by means of a bombardment in

which many lives are lost ; rioting beginning in the province of Bari, Italy.

January 10.—The Republican Senate of New Jersey forces the door and gets into the Chamber ; movement on foot to promote harmony....Five masked men rob a Missouri train....The Colorado Senate declines to print Gov. Waite's message....Vaillant, the Paris bomb-thrower, sentenced to death by the guillotine....Seven men killed in a riot at Corato, province of Bari, Italy, by the troops ; France suspected of inciting the outbreak ; Sicilian Deputy de Felice will be tried for high treason.

January 11.—The New Jersey Senate Chamber again held by Democrats, after ousting the Republicans....Customs receipts increasing ; the Wilson bill attacked by both Democrats and Republicans....Justice Bartlett refuses to quash the indictments against McKane....All is quiet again in Sicily....Insurgent forces sustain reverses in Brazil ; the business situation at Rio improving.

January 12.—The income tax divorced from the Tariff bill ; it will be introduced as part of the internal revenue schedules ; Bland's committee reports favorably his bill to issue certificates against the seigniorage silver....Repair shops of the Erie Railroad with adjoining tenements destroyed by fire in Jersey City....Admirals Benham and Mello arrive at Rio....Spain has demanded of Morocco an indemnity of \$5,000,000 and the formation of a neutral zone around Melilla.

January 13.—The President sends to Congress a second message containing correspondence in the Hawaiian affair....Hornblower's friends hope to procure Republican votes enough to insure his confirmation....Many farmers starving in Manitoba....Not one of Captain Wilson's force pursuing Lobengula escaped...A religious uprising threatened in Mexico....Germany's political crisis ends in a triumph for Chancellor Caprivi.

January 14.—A triple lynching for murder done at Russell, Kan....Insurgents bombard the government shore batteries at Rio ; "Aquidaban" fires on Ponta da Aroia, but is worsted....A fatal conflict between troops and workmen in Italy caused by Anarchists ; Socialists in Leghorn urge a general strike....Three hundred persons burned to death in a temple at Ning Po, China.

January 15.—Secretary Carlisle asks for authority to issue bonds to cover the deficiency at the end of the fiscal year, which he estimates at \$78,000,000....Senator Hill succeeds in defeating Hornblower's nomination in the Senate....A crash in the fog between two Delaware, Lackawanna and Western trains results in the death of nine persons and injury to a score....The debate in the House grows hot over the committee's amendments to the Tariff bill....A hitch occurs in the reorganization of the Richmond Terminal system, due to alarm on the part of Danville floating debt holders....New Jersey's Attorney-General sustains the Democrats in his opinion on the Senate squabble....Da Gama will try to hold out at Rio until help reaches him ; his forces too weak now to capture the mainland....Workmen fail to respond to the call for a general strike, but there is much rioting in Leghorn....Eighty members of the Omladina, accused of political crimes, arraigned at Prague.

January 16.—The Senate Finance Committee decides that the best way to relieve the Treasury is to keep the gold reserve intact....The Senatorial fight in New Jersey will be compromised....Brooklyn and Buffalo Senators raise the flag of revolt against Platt's measures in the New York Legislature....Insurgents defeated in Brazil and compelled to raise the siege of Bagé ; the government

holds the entire coast of Rio Grande do Sul....Italian Anarchists are terrorizing the people around Carrara ; they make several attempts to enter the city, but are driven back by troops massed there....French $4\frac{1}{2}$ per cent. rentes will be converted into $3\frac{1}{2}$ per cents.

January 17.—Secretary Carlisle offers a \$50,000,000 five per cent. bond issue at 117.223....Two railroad accidents occur in New Jersey and South Carolina....A riot takes place in Kansas City....A committee amendment to postpone until August 1 the operation of the free wool schedule defeated in the House....A state of siege declared at Carrara and Massa di Carrara, Italy....The Siamese are busy evacuating the left bank of the Mekong....Russia will extend the circuit in which Jews may freely settle.

January 18.—Offers for the new bonds may reach \$200,000,000 and the price may be forced to 120, making the rate of interest practically $2\frac{1}{2}$ per cent....Another express train held up and robbed successfully in Missouri....The wool schedule, as reported by the committee, adopted in the House....It is reported that the present trouble in Brazil will be submitted to arbitration....Anarchists take flight from Carrara and seek refuge in the mountains ; 2,000 of them are in need of food and clothing ; riots among the unemployed in Berlin and Madrid....Lobengula wishes to surrender....A deficit exists in Prussian finances ; Caprivi will prosecute his enemies for libel....An earthquake in Thibet destroys monasteries and many lives.

January 19.—Congressman Bailey introduces a resolution into Congress questioning the legality of the recent bond issue....The cruiser "Montgomery" makes 19 knots on her official trial trip....Free rail amendment to the Tariff bill voted down....Insurgents win a victory at Rio ; Admiral Benham's mission believed to be arbitration....The government expects to starve out the Anarchists concealed in the mountains around Carrara ; several arrests made....A cabinet crisis exists in Servia, due to ex-King Milan's intrigues.

OBITUARY.

January 16.—Ex-State Senator George Z. Erwin, of Potsdam, N. Y....Col. Frank A. Burr, journalist....Hon. Thomas B. Carroll, newspaper man and politician of New York.

January 17.—Brig.-Gen. Horace Brooks, U.S.A., of Baltimore....Ex-Congressman Forney, of Alabama....William Holyoke, English court painter.

January 18.—George Bartlett Prescott, one of the pioneers in electricity in this country....Gen. Wm. H. Noble, of Bridgeport....G. F. Rothwell, ex-Member of Congress from Missouri.

January 19.—Ex-Gov. G. W. Gaston, of Massachusetts....John Haley Spears, prominent in Illinois politics.... Paul Declair, Parisian dramatist.

THE LATE SIR SAMUEL BAKER.

this city....Geo. W. Savage, United States Consul to Dundee, Scotland, conspicuous in New York fire insurance history.

January 4.—Marshall B. Blake, for twenty-five years Collector of Internal Revenue in New York....Elizabeth P. Peabody, author and educator....Baron Karl von Hasenauer, the most conspicuous architect in Austria.

NATIONAL BUDGETS.—AMERICAN AND EUROPEAN.

MOST of the great nations of the world are just now engaged in highly contentious attempts to reconstruct or extend their systems of taxation, for the purpose of making their revenues equal to the demands of an ever increasing expenditure. Some compact information as to amounts and sources of national income, and the chief items of outgo, may be of convenience to our readers just now.

Before the McKinley bill was passed, much more than half of the value of goods imported into the United States paid a duty. Since that law went into operation, the larger part of our imports comes in free. Thus in the fiscal year ending with June, 1890, we imported \$266,000,000 worth of free goods, while for the fiscal year 1892 the amount is placed at \$458,000,000. In 1890 we collected tariff taxes at an average rate of 44.41 per cent. upon \$507,000,000 worth of goods, and in 1892 the tariff was paid upon \$355,000,000 worth, at an average rate of 48.71 per cent. The summarized American balance sheet for the fiscal year that ended last June is as follows:

RECEIPTS.	EXPENDITURES.
Customs.....\$203,355,017	War Dep't \$49,641,773
Internal rev- enue..... 160,296,130	Navy Dep't..... 30,136,084
Sale of public lands..... 3,182,090	Indians..... 13,345,347
Various sources. 18,253,898	Pensions..... 159,357,558

ENGLAND'S FISCAL SYSTEM.

Great Britain has a wider range of sources of national income than the United States. Instead of two main sources the British government has four. The two largest are like our own:—Import duties, and internal revenue (excise) on spirits. The other two are the income tax and a series of imposts known as stamp taxes. These stamp taxes are collected on all kinds of legal transactions, and the great bulk of them pertain to the settling of estates and are known as death duties,—i. e., taxes upon the probating of estates, upon legacies and upon successions. Stamps upon deeds, receipts, insurance policies, patent medicine packages, and various papers and transactions make up the rest. There is a small national land tax and a house duty that yield some revenue, and the operation of the post office is somewhat profitable. The elastic element in the English system is the income tax, which is made higher or lower to meet the situation. The condensed exchequer receipts and expenditures for the British fiscal year 1892-93 in pounds sterling (es-
timate about \$5 to £1) are as follows.

RECEIPTS.	EXPENDITURES.
Customs.....£19,715,000	Army.....£17,542,000
Excise..... 25,360,000	Navy..... 14,302,000
Income tax..... 13,470,000	Civil services.... 17,780,000
Stamps..... 13,805,000	Interest on debt,
Land tax and house duty.... 2,450,000	etc..... 28,306,000

Including gross income from post office, and various miscellaneous items of revenue, the total income is £90,395,000.

Including expenses of postal and telegraph service, and other miscellaneous outgoes, the total expenditure is £90,375,000.

FRENCH REVENUES AND EXPENDITURES.

In France, the bulk of the revenue comes, as in England and the United States, from indirect taxes; but the French have a much greater range and variety of imposts. In round figures, the total annual revenue of France for the past two or three years has averaged about 3,300,000,000 francs, or \$660,000,000 (five francs equalling a dollar). Of this amount, 2,000,000,000 francs accrue from indirect taxes, of which 500,000,000 come from customs dues on imports and the rest from a great variety of internal taxes, including a registration tax which yields more than the custom houses, a sugar tax that gives nearly 200,000,000 francs of revenue, a lucrative group of stamp taxes on legal papers and transactions, and various imposts on liquor, etc. The direct taxes are upon land and buildings, personal property, doors and windows, trade licenses, etc., and amount altogether to nearly 500,000,000 of revenue. The State monopolies of tobacco and gunpowder and the postal and telegraphic services yield a large revenue, exceeding 600,000,000 francs. The public forests and various minor sources make up the rest of the sum total.

To meet charges on the public debt the great sum of about 1,300,000,000 francs is required. The army requires an outlay of about 650,000,000. The maintenance of the navy costs about 225,000,000.

THE BALANCE SHEET OF THE GERMAN EMPIRE.

Germany's financial position differs materially from that of France or Great Britain in the fact that the German Empire, being a federation of States, has a less intimate relation with the people, and it has no need to raise money for various kinds of expenditures that its constituent members, like our American States, attend to in their own way and upon their own account. Its budget, therefore, is smaller than those of France and Great Britain. The average income is about 1,200,000,000 marks, or \$300,000,000 (four marks being equal to one dollar). One important reason why Germany can get along with less than half the national income of France lies in the fact that the Empire has a small public debt. The war indemnity paid by France has saved Germany from the permanent burden of a heavy interest charge. The total principal of the German public debt is scarcely if any greater than the annual interest charge on the French debt. The interest charge is only about \$15,000,000 yearly, as against \$260,000,000 on the French debt, \$125,000,000 on the English, and \$27,000,000 on that of the United States. But it should be remembered that Prussia, Saxony and the other members of the German Empire have their own rather heavy debts.

The support of the army, which costs upwards of \$100,000,000 a year, is the heaviest expense of the Imperial Government. The navy costs some \$12,000,000 a year. The maintenance of the Treasury's ramified service, and other branches of the federal government, with pensions, etc., takes the rest of the income.

Germany has two great sources of imperial revenue; first, the customs and excise duties, which are managed together and which yield fully half of the total sum collected, and, second, the direct contributions of the German States to the imperial treasury in the proportion of their importance. The tariff and excise dues yield about 600,000,000 marks, and the direct contributions last year amounted to 316,000,000 (\$80,000,000), of which Prussia contributed 188,000,000, and all the other States together 128,000,000.

The German Empire also has a comparatively small revenue from stamp taxes, from postal and telegraph services, from railways, and from a few other sources. These, with the extraordinary income derived from loans, etc., would make up the last year's budget of 1,200,000,000 marks. Prussia itself derives much revenue from a moderate income tax, besides making large profits upon its administration of public railways, mines, forests, etc.

TAXATION AND EXPENDITURE IN ITALY.

Italy has far less of population and wealth than the other great powers, and its desperate financial condition is due to a policy which has fixed upon the country a group of annual expenses heavy enough for a nation three times as rich and populous. Its public debt is now 12,000,000,000 *lire* or more (\$2,400,000,000, five *lire* being equal to one dollar), and the interest charge takes more than \$120,000,000 of the revenue every year. Then the great Italian army costs about \$50,000,000, and the navy costs \$20,000,000 every year. The average expenditures of Italy have for the past eight years reached about 1,900,000,000 *lire*, with the average income nearly a hundred millions less. This has meant increase of floating indebtedness, and has had its share in producing the bank scandals and the disgrace that has overtaken statesmen and bankers together.

To produce the yearly revenue, which has averaged about 1,800,000,000 *lire*, but which sank to 1,666,000,000 last year, almost everything imaginable is taxed by the Italian government. Customs duties on imports last year yielded 231,000,000 *lire*; the income tax, 238,000,000; the tobacco monopoly, 193,000,000; the salt monopoly, 63,500,000; the land tax, 106,000,000; the house tax, 84,000,000; registration (a tax on various transactions), 62,700,000; stamp duties, 73,300,000; succession duties, 36,300,000; excise, 33,000,000; octrois (taxes levied on various articles of common use brought from the country into towns and cities), 69,000,000; lottery taxes, 76,000,000. To these should be added the income from State railways, posts and telegraphs, and half a dozen other less important sources. The Italians understand well the

principles of taxation, but they lack the ability to carry the burdens they have imposed upon themselves.

HOW RUSSIA OBTAINS HER VAST INCOME.

Russia is an empire of almost limitless natural resources; but its wealth is not highly developed enough to sustain without difficulty so heavy a budget as the government finds necessary. It required an income of more than 1,000,000,000 roubles to meet the expenditures of the past year of profound peace. The rouble is equal to 80 cents of American money, and the Russian government's yearly bills therefore exceed \$800,000,000. Of this amount nearly \$160,000,000 (200,000,000 roubles) was needed for charges on the public debt, \$185,000,000 for the army, and \$40,000,000 for the navy.

Russia collects its one thousand million roubles of revenue from a variety of sources, of which indirect taxes are the most important. Thus customs last year were estimated to yield 135,000,000 roubles; excise on spirits, 257,000,000; excise on tobacco, 30,000,000; stamp duties, 61,000,000; excise on sugar, 28,650,000, and excise on naphtha and matches together some 24,000,000. Direct taxes on land and personal property, on trade licenses and on capital yielded about 95,000,000. From State domains, Russia being a vast landed proprietor, the income was about 135,500,000 roubles, and from the redemption of peasants' and serfs' lands, some 77,000,000 more was realized. The mines, posts, telegraphs, etc., yielded 38,000,000 or more. These are the principal sources of ordinary income, and they are scarcely sufficient to provide for the growing disbursements.

AUSTRIA-HUNGARY'S FINANCIAL ARRANGEMENTS.

The Austro-Hungarian Empire, as a whole, has comparatively little need of a public revenue except for the maintenance of the imperial army. The dual monarchy is allowed the net proceeds of certain moderate customs duties, but its main source of revenue is the direct payment of contributions from the separate Austrian and Hungarian treasuries, Austria paying 70 per cent. and Hungary 30 per cent. The "common affairs" of Austria-Hungary required about 144,000,000 florins last year (the florin being equal to 40 cents of American money). Of this sum 42,000,000 came from the customs surplus, and about 100,000,000 was paid out of the Austrian and Hungarian treasuries. Of this 144,000,000 about 138,000,000 was expended through the Ministry of War. The rest went to meet the expenses of the Ministry of Foreign Affairs and the Ministry of Finance.

This review of the budgetary status of the principal states of the world is not designed to be otherwise than very general and summary. It affords a convenient opportunity to glance at the main sources of income and outgo of the great European public treasuries, at a time when the readjustment of our own revenue system is the principal subject that occupies the attention of Congress.

OUR NEW NATIONAL WONDERLAND.

BY CARL SNYDER.

THAT large and liberal foresight which years ago forestalled the spoliation or capture by private interest of the wonderlands of the Yosemite, the Yellowstone and the Sequoia by creating of them great national parks, has had such a splendid fruition that the proposition to set aside other regions of marvelous scenic and natural interest as their utility and value become manifest can hardly fail of the heartiest and readiest approval. It is safe to say that no single element that might be considered has contributed so much to popular enlightenment regarding the interior of the country as the tourist travel which the wide and just fame of our national parks has aroused. Much of the prevalent provincialism of the East, which regards the West very much in the way that we in our popular ignorance regard Australia, has been dispelled by a continental tour which only so powerful a magnet as the Grand Cañon or the falls of the Yosemite could have induced. In like manner much of foreign travel to our shores has come not from any particular interest in America, but from reports spread abroad of these realms of scenic

opulence before which the mild glories of the Alps and Apennines grow anæmic and dull.

BROADENING OUR NATIONAL POLICY.

Thus far, under special enactment by Congress, four of these wonderful regions have been set aside and placed under national care and control. Aside from the Yellowstone and the Yosemite, are two of lesser fame, the Sequoia and the General Grant, both situated in California. But under the administration of President Harrison a movement looking to a much wider extension of this policy was successfully initiated, with the result of removing from the public domain some fifteen million acres, lying in seven Western States, under the designation of Forestry Reserves. The purposes and locations of these reservations, which have a combined area of three states the size of Massachusetts, were outlined at length by the REVIEW OF REVIEWS in July of last year. In the larger number of instances the immediate object aimed at was the retention under national control of large areas of forest lands, mainly

IN THE PARK—ALONG MASHIEL CAÑON.

of high altitude, which are the important sources of streams of great value for the irrigation of the plains and valleys through which they flow. But one of the reservations was simply the preliminary step to the creation of a new national park, which will possess as supreme interest, though of a widely divergent character, as the wonderlands of Wyoming and California.

WHERE IS THIS NEW WONDERLAND?

This proposed new national park lies in the State of Washington, in the very heart of that vast and sombre forest which, stretching northward from the Columbia river far into the solitudes of the British Possessions, muffles in a dark pall of verdure the whole long western slope of the Cascades. Here the heavy rain-laden clouds blown in from the Pacific, finding their easternward flight barred by the mountain barricade, pour down upon the region an annual rainfall of fifty inches. It nurtures the giant growth of fir and cedar and spruce, the heavy festooning moss and the deep tangled undergrowth that makes of much of Western Washington a dense and sometimes impassable jungle.

It is for this reason that the wonders of the new park have so long escaped alike the incursion of tourist or descriptive artist, while the glories of more accessible regions have been heralded throughout Christendom. And it might still remain unknown and unnoticed were it not that from out this almost Cimmerian land rises the most superb and majestic mountain peak to be found on this continent, if not upon the round earth. For while there are other peaks whose brows are cooled by yet higher altitudes there are none which present such a rare and wondrous union of symmetry and sublimity, of mystic color, perfection of graceful outline and gigantic and awe-inspiring shape as this soaring dome of snow, the Mt. Rainier of the maps, the Mt. Tacoma of popular usage and aboriginal tradition. There are few who may look upon its lone and simple majesty with soul unmoved, for it is one of nature's masterpieces. And there are few who, having looked upon it, do not experience a desire to penetrate the dreamy veil in which it hangs and make acquaintance of its nearer beauties. It has a spell and a fascination so subtle and resistless as to stir the commonest clod, while it spurs the poetic fancy to fantastic flights. I remember as I first watched it grow, luminous, opalescent and regal from out the mantle of mist which held it as in a shroud, I could have summoned back the whole antique world of mythology and domiciled it upon this greater and grander Olympus.

THE MATTER OF A NAME.

Very stupidly and oddly has the name of this splendid peak got upon the older maps. Just a century ago, when George Vancouver, of the British royal navy, entered the Strait of Fuca and sailed up the beautiful body of water before him, he beheld what was to him an unknown land, enchanting of view and air. Assuming the right of a discoverer, he proceeded to a reckless libel of every available point of the landscape with the names of his former companions of the mess. Reserving the island where he first touched to himself, he burdened the unequaled expanse of inland sea before him with the name of his lieutenant, Peter Puget. Against the eastern sky line rose the long crest of the pine-darkened Cascades, while far above, spacing the horizon at intervals of a hundred miles, were lifted the snow cones of three immense extinct volcanoes, and these he christened, from three British lords of the Admiralty, Hood, Baker and Rainier.

Now Vancouver, be it said, was not a discoverer any more than was Theodore Winthrop, who came 50 years after. Spanish settlements existed on the Sound when he came, and Spanish, Italian and Japanese explorers had visited and mapped the region before Vancouver, and it was the Spaniard's charts which he employed when he first visited the region. The Spanish names still cling all about the Sound, Camaano, Fidalgo, and many others. Similarly, too, do the beautiful Indian names, which have held for

centuries. Well, for centuries before Vancouver, the Indian tribes called the great mountain at whose base they dwelt, with slightly varying dialects, but all with an exquisitely musical speech, Tah'-o-mah, Tah'-co-bet, or Tah'-ko-mah. And from these varying shades Theodore Winthrop, with a poet's ear, caught and fixed the name Tacoma.

PRESERVE THE NATIVE NAMES!

That this is the English equivalent of the guttural Indian speech admits, I think, of no doubt. Mr. James Wickersham has made a painstaking research among the Indians, and his demonstration seems to me conclusive. At a gathering where the Indians were called in testimony, old John Hiaton, one of the patriarchs of his tribe, arose and with dignified gesture said:

I see all the ladies and gentlemen. I am going to call the name of the mountain, the name God gave it. God put me down here before you came. He put me here for seed—perhaps he sent you here. My people call mountain "Tahcobet." "Tahcobet" is mountain's name—nobody can change—that is all.

And if this simple, stately speech were not sufficient, the testimony of the others, including Angeline, the daughter of the great chief Seattle, would be ample. Nor is it easy to see why so fair an object should be saddled with the name of some nautical nobody, who never got into history, and never so much as saw the continent on which the mountain rests. As lief call the murmuring flood of the Mississippi "Ferdinand's river," because, forsooth, De Soto saw its mouth, Minnehaha or Niagara "Brown's" or "Jones' Falls," or the Yosemite "Balboa's Park," as call this incomparable mountain and the region round about it by the name of a nobody called Regnier or Rainier, no one has been able to find out which.

DISCOVERED BY A POET.

It was Theodore Winthrop, of gentle memory and pathetic fame, who first spread abroad the glories of the siwash's Tacoma. Years ago, a matter of some four decades to be exact, Winthrop, young, ardent, and a poet to boot, journeyed West. When he crossed the Isthmus of Panama, and struck northward, he found about the Golden Gate a patch of population,—a population that, in paradoxical parlance, had been summoned by a fever for gold. But for the rest, from beyond the Missouri to the rolling tides of the Pacific, he found a land which the maps still traced with uncertain outline, and peopled only with sayages, save where in one blooming oasis by the shores of the Great Salt Lake the children of a new Messiah had plunged into the wilderness seeking a home and a haven from the bigoted persecutions of a nation that still traded in slaves. Penetrating as far as the region which Congress was about to erect into the Territory of Washington, he brought back report of this lonely peak rising sheer from the inmost waters of Puget Sound, whose name he caught from the varying dialects of the Indian tribes and fused into the softened cadence of "Tah-co-ma." His first dazzling vision of the mountain, caught as he paddled up that matchless inland sea which bears the name of Vancouver's lieutenant, Peter Puget, Winthrop cast in these vivid and colorful lines:

WINTHROP'S APOCALYPSE.

We had rounded a point and opened Puyallup Bay, a breadth of sheltered calmness, when I, lifting sleepy eyelids for a dreamy stare about, was suddenly aware of a vast white shadow in the water. What cloud, piled massive on the horizon could cast an image so sharp in outline, so full of vigorous detail of surface? No cloud, as my stare, no longer dreamy, presently discovered,—no cloud, but a cloud compeller. It was a giant mountain dome of snow, swelling and seeming to fill the aërial spheres as its image displaced the blue deeps of tranquil water. The smoky haze of an Oregon August hid all the length of its lesser ridges and left this mighty summit based upon uplifting dimness. Only its splendid snows were visible, high in the unearthly regions of clear blue, noonday sky. The shore line drew a cincture of pines across the broad base, where it faded, unreal, into the mist. The same dark girdle separated the peak from its reflection, over which my canoe was now pressing and sending wavering swells to shatter the beautiful vision before it.

Kingly and alone stood this majesty, without any visible comrade or con-

LONGMIRE'S SPRING AND "HOTEL"—THE ONLY HABITATION IN THE PARK. MT. TACOMA IN THE DISTANCE.

SLUISKIN FALLS, IN PARADISE VALLEY. HEIGHT ABOUT FOUR HUNDRED FEET.

sort, though far to the north and the south its brethren and sisters dominated their realms, each in isolated sovereignty, rising above the pine-darkened sierra of the Cascade Mountains—above the stern chasm where the Columbia, Achilles of rivers, sweeps short-lived and jubilant to the sea—above the lovely vales of the Willamette and the Umpqua. Of all the peaks from California to the Frazer river this one before me was the royalest. Mount Regnier, Christians have dubbed it in stupid nomenclature, perpetuating the name of somebody or nobody. More melodiously, the siwash call it Tacoma, a generic term also applied to all snow peaks. Whatever keen crests and crags there may be in its rocky anatomy of basalt, snow covers softly with its bends and sweeping curves. Tacoma, under its ermine, is a crushed volcanic dome, or an ancient volcano fallen in. But if the giant fires had ever burned under that cold summit, they had long since gone out. The dome that swelled up so passionately had crusted over and then fallen in upon itself. Where it broke in ruin was no doubt a desolate waste, stern, craggy and riven, but such drear results of Titanic convulsions the gentle snows hid from view.

No foot of man had trampled these pure snows. It

was a virginal mountain, distant from the possibility of human approach and human inquisitiveness as a marble goddess is from human loves.

PUGET SOUND THEN AND NOW.

This was forty years ago. The railway now penetrates where Winthrop trod a wilderness, and the ships of commerce from the distant ports of the Orient ply that beautiful Sound down which, in the midst of a vast solitude, the young traveler paddled in a rude Indian dug-out. Two modern and prosperous cities, one named from the great mountain in whose shadow it lies, the other from the great chief who so long ruled the tribes that dwell at the mountain's feet, Tacoma and Seattle, have been builded where Winthrop found only Indian huts. And attracted by its grandeur and its mystery, the mountain which seemed to him so distant from human approach has been explored, its fastnesses penetrated and mapped, and a number of successful ascents to its far summit have been made. And such a wonderful region has it been discovered to be that fitting recognition can be made of it in but one way: to set it aside as our third great national park.

THE WASHINGTON NATIONAL PARK.

The first step toward this end was made when on February 20 last President Harrison issued a proclamation setting aside a tract of some fifteen hundred square miles about the mountain as the *Pacific Forestry Reserve*. And now before Congress is the bill, introduced by Senator Watson C. Squire, which our legislators are urged to put to a speedy passage, "dedicating this area, to be known as the Washington National Park, for the benefit and enjoyment of the people of the United States, forever." The reservation, lies in the southwestern portion of the State of Washington, about forty miles directly southeast of the city of Tacoma, and includes portions of Pierce, Kittitas, Lewis and Yakima counties. Some forty miles east and west, and about thirty-eight north and south, it contains in all about 1,000,000 acres, or a rather larger area than the State of Rhode Island. I can but briefly indicate some of its characteristics.

THE GREATEST GLACIAL SYSTEM IN THE WORLD.

Chief of all among the wonders of the region are its glaciers. Spun round the mountain as an axis, like the radial spokes of some gigantic wheel, are some fourteen huge ice fields, varying from a mile to twelve miles in length. Though no one of them taken alone equals in size the great Muir glacier of Alaska, together they constitute the greatest glacial system in the world. By way of comparison, rather than disparagement, it may be said that all the glaciers of the Alps might be snugly stowed away in a minor segment of this immense circle.

Perhaps the largest of the ice fields is the Tahoma, lying on the southwestern slope of the mountain. Its proportions may be roughly stated as about one mile in width, seven miles in length and an average depth of 600 feet. Imagine if you will a solid block of ice

whose average thickness is twice the height of Trinity spire, and in places between one and two thousand feet, and of sufficient length and width to cover one-half of Manhattan Island. The Nesqually, the Cowlitz, the Carbon and White river glaciers are of but little less immensity, the last named being fully twelve miles in length. When now you consider that a glacier a mile in length and half a mile wide, in Europe, is an eminently respectable affair, you may grasp something of the size and bulk of this field of ice.

From these massive storage reservoirs flow some six streams varying from 70 to 100 miles in length, the Cowlitz, Natches, the White, Puyallup, Des Chutes and Nesqually, which variously empty into the Columbia, Puget Sound and the sea. Frequently is to be witnessed the singular spectacle of a stream bursting from the glaciers in full head. Thus as the great Nesqually glacier issues from the narrow cañon which holds it like a vise, it presents a towering wall of ice five hundred feet high, of abrupt face, from which the river pours in noisy torrent beneath. Again, on the surface of the glaciers themselves, small streams are seen tumbling down into some deep-riven crevasse, while here and there a lakelet of deep blue water five or six hundred feet in diameter is to be observed nestling on the solid ice.

The color effects of the glaciers, too, are often of

IN PARADISE VALLEY, SHOWING THE SEMI-TROPICAL VEGETATION WITH WHICH IT IS CARPETED.

extreme beauty. Countless crevasses occur, and caverns and grottoes, hollowed out by the action of the water on the ice; and in these the dazzling white of the glacier's back turns to a varying hue of emerald and at times to a tint of blue.

The geological formation of Tacoma seems little able to resist the eroding power of these mighty engines, and the stories told by its rugged, deep-furrowed sides, stories written with slow, toilsome fingers through countless centuries, are of inexhaustible interest to the geologist.

A CAMP IN PARADISE.

In almost startling contrast to all this dreary desert of snow is the unique beauty and sublimity of Paradise Valley. Lying on the southern slope of the mountain, shut in on either side by the huge glaciers of the Nesqually and Cowlitz, and surrounded by towering walls of basalt, the effect as you come upon it is bizarre in the extreme; it is as though one had stepped from the regions of the pole into a semi-tropical garden. Here nature revels in her most gorgeous scenic and chromatic effects. The valley is a deep, broad natural park, some ten miles in length and perhaps two wide, and curved in the form of an uncompleted horseshoe. It lies just below the line of perpetual snow; its basaltic palisades protect it from the glacier's chilling breath, and as the warm southern sun beats upon its rich volcanic soil, it summons to life an almost tropical vegetation, which spreads over the floor of

A SAMPLE WASHINGTON LOG, VIEW TAKEN FROM NEAR THE PROPOSED PARK.

the valley like a carpet of brilliant color. It is almost a hothouse effect. At the extreme head of the park lies Paradise glacier, pouring forth the turbulent, milk-white stream which goes swirling down the valley like a stria of pearl in the richer emerald or amber of the foliage. Higher still gleam the cold white flanks of the Cowlitz glacier, while over the jutting cliff-tops the riotous streams poured down from the ice fields take flying leaps from the dizzy crests, and shimmer gently into the far depths. Chief of these is the beautiful Sluiskin or Paradise Falls, at the head of the valley. A little lake nestles at the foot of the ridge, while away to the southward, a hundred miles to the Columbia, the rough and broken country stretches away like an angry, tumultuous sea. St. Helens, a sharp volcanic cone wreathed in snow, lifts its graceful head in the distance, and beyond are Mt. Hood and Mt. Jefferson. Looking down the valley the basaltic walls seem of an artificial regularity; the effect of the vivid coloring of the foliage is weird and fantastic, as if the sunlight were filtered through some vast prism; and as the eye sweeps the scene with its strange com-

mingling of crag and waterfall, glacier and garden-like vegetation, the blending of January and June, one might fancy the spot some ancient playground of the young gods.

A camp in Paradise Park is an unmixed delight. Game abounds and the scenery is intoxicating. And it is here, at an elevation of about 6,000 feet, that you begin to appreciate something of what awaits the climber who pushes on to the summit. Camp of the Clouds, which lies on a high ridge above the valley, about 7,000 feet up, is at a higher elevation than is Pike's Peak summit above the city of Denver. There is still a matter of 8,000 feet, a mile and a half, of sheer ascent before the top is attained.

THE HIGHEST PEAK IN THE UNITED STATES.

But the mountain itself is and ever will be the central point of interest as it is the dominant figure of the landscape. It is the middle of the three dazzling snow peaks which space the crest-line of the Cascades at intervals of about one hundred miles. Mt. Hood at the south and Mt. Baker at the north attain a height of 10,000 and 11,000 feet, while Tacoma rises nearly 4,000 feet higher, or to an altitude of 14,444

Photo. by Irenca, Tacoma

PARADISE RIVER AS IT BURSTS FROM THE FOOT OF PARADISE GLACIER.

ON THE ROUTE OF ASCENT. "SOUNDING" THE DEPTH OF A CREVASSE ON THE COWLITZ GLACIER.

feet.* This, it should be borne in mind, is the visual as well as the actual height, for Tacoma rests its base practically at the edge of the sea. Thus, although Pike's Peak, for example, or the Matterhorn of the Alps, are each of about an equal altitude, rising as they do from a high plateau five to seven thousand feet above the level of the sea, they afford the eye hardly half that the aspect of sublimity as this Co-

ON THE SUMMIT, LOOKING TOWARD CRATER PEAK, ALTITUDE ABOUT FOURTEEN THOUSAND FEET.

lossus of the Pacific. Four or five Mt. Washingtons might be piled one above the other, like the superimposed temples of Belus, and still hardly attain the cold and distant heights to which Tacoma rises.

* Recent and more accurate measurements show that the true height of the mountain is above 15,000 feet, so that Tacoma is the highest peak within the borders of the United States.

Similarly it would require a pile of thirty pyramids the size of that of Cheops to reach the level of its summit. It overlooks Puget Sound from Olympia to Victoria, a distance of 160 miles. It is visible from the city of Portland, 120 miles to the south, and from Walla Walla, on the eastern edge of Washington, 150 miles away. Within the field of vision from its summit are included nearly the entire State of Washington, and portions of British Columbia, Idaho and Oregon. Fancy such a peak as this rising from the midst of the Alleghanies! Not a tourist or a geologist in twenty States but who would have visited and explored it, and attempted its summit, while beside it Niagara would be a point of moderate interest.

BULK ENOUGH TO DAM THE ATLANTIC.

Then, too, its enormous bulk. Tacoma is not attached to the range, but stands silent and apart, like the royal chief that it is. This single mountain is nearly ninety miles in circumference at its base; at the line of perpetual snow, about 5,500 feet altitude, it is twelve miles in diameter, while its broad summit is more than two miles across. And it is, as I have said, nearly three miles high. A pen and pencil will readily compute its volume, nearly 200 cubic miles. That is to say, if the average depth of the Atlantic does not exceed one mile, the material contained in this mountain would construct a solid embankment of an average thickness of 300 feet from Cape Cod to the English coast. From the summit of Tacoma the tower of Babel would have been hardly more visible than one of the church spires of a Puget Sound city.

A FLOATING CASTLE OF THE SKY.

Seen from almost any point of the compass, the aspect of the mountain is imposing beyond words. Perhaps the best attainable view, if one does not care to penetrate the interior, is from the top of the noble bluffs on which the city of Tacoma lies. Here the eye, looking up the low intervening valley of the Puyallup, may command the entire bulk of the mountain from base to summit. The picture is strangely varied and changeful; on one day the

PRINCESS ANGELINE, DAUGHTER OF CHIEF SEATTLE.

mountain seems cold, distant and lifeless, and, again, warm, glowing, opalescent, like tinted alabaster. For days it will remain hidden behind the dense mists which gather about it, and then as the clouds part loom out of the murk in all its imperial majesty. Still again, its base will be buried in cloud, while above will rise brow and shoulders, masked in their spotless ermine, resting only upon the filmy fleece of mist, and suggesting a floating castle of the sky.

AN ART LESSON FROM NATURE.

All this superb panorama is the daily and hourly vision of the favored people who dwell on the shores of Puget Sound. Nor does it grow common to them, so that they lose the fresh, keen sense of its beauty that belongs to the first view. Its variety, its changeful grandeur, its almost dramatic reappearances after days of obscurity, forestall that. What an exquisite

sense of the artistic must eventually be bred, then, in these people, when such beauty is a part of their daily lives! It was such a suggestion that came to Winthrop, and recording it he added these prophetic lines:

Our race has never yet come into contact with great mountains as daily companions of life, nor felt that daily development of the finer and more comprehensive senses which these signal facts of nature compel. That is an influence of the future. The Oregon [now Washington] people, in a climate where living is bliss—where every breath is a draught of vivid life—this people, carrying to a new and grander New England of the West a fuller growth of the American idea, under whose teaching the man of the lowest ambitions must still have some little indestructible respect for himself, and the brute of the most tyrannical aspirations some little respect for others; carrying there a religion two centuries further on than the crude and cruel Hebraism of the Puritans; carrying the civilization of history where it will not suffer from the example of Europe—with such material, that Western society when it crystallizes will elaborate new systems of thought and life.

A CHANCE FOR A MASTERPIECE.

But whatever inspiration may come in the future, Tacoma yet awaits its Thomas Moran. No painting yet worthy has been put upon canvas, and as little success has awaited its photographers. Thousands of negatives have been spoiled, but brush and camera alike fail in reproducing the living reality. Although distant from the city of Tacoma a matter of forty-four miles, the mountain often seems hardly ten, and, indeed, one might fancy a trip to its base merely a good English constitutional, such is the effect of the low and haze-hung country which intervenes.

Yet finer and more magnificent is the view from Vista Peak, so appropriately named. You are here some six miles distant from the base of the mountain and twelve from the summit, with naught to obstruct the vision. Here, after a toilsome and arduous climb up through the deep-shadowed, thick-matted forest, the mountain bursts on the view in all its beauty, and here its detail may be studied with accuracy.

CLIMBING OUR GREATER MONT BLANC.

The ascent of Tacoma itself is, on the whole, perhaps more arduous than perilous, and thus far no fatalities have been recorded. But an ascent is not won at any light cost, and the climber who essays that bleak and barren summit must be well supplied with resolution, coolness, endurance and daring. And even with these he may fail, as many have.

The first white man, probably the first of human kind to make the ascent, was General, then Lieut., A. V. Kautz, who in 1857 was stationed at Fort Steilacoom, a little frontier stockade on Puget Sound. Of an adventuresome turn, he induced two companions to make the attempt with him. They reached the saddle back below Peak Success, perhaps 1,000 feet below the actual summit, Crater Peak, when hunger and exhaustion forced them to an immediate descent.

A more successful attempt to explore the top of the mountain was made in 1870 by General Hazard Stevens and P. B. Van Trump, accompanied by the old Indian guide Sluskin. They chose what is now

the accepted route, through Paradise Park and up by the side of the Cowlitz Glacier and Gibraltar Rock, reached Crater Peak and Peak Success, and spent a night in the crater caverns. Sluiskin awaited them about half-way up, in reality never expecting their return. No amount of urging would induce him to make the ascent. Tah-ho-ma he regarded as the dread abode of an evil spirit who would hurl avalanches on the impious mortal who dared penetrate his sacred precincts. The Indian superstition of the

OLD ADAM, OF THE KLICKITAT TRIBE. (SAID TO BE ABOUT ONE HUNDRED AND FIVE YEARS OLD.)

mountain is general, and in the picturesque legends of these red men there runs the story of one who climbed to the top and found there a fiery lake, but was hurled down by the spirit who abides there, indicating that the mountain has been in eruption within legendary times.

HERE ALSO, MANY ATTEMPT, FEW SUCCEED.

Since then several successful ascents have been made, and in 1890 Miss Fay Fuller, a young lady of Tacoma, braved the rigors of the climb, and won the honor of being the first woman to reach the summit. Many attempts are made each summer, but the number of those whose names are recorded in the caverns of the crater is not large. Thus of all the numerous parties who essayed the feat during the recent season only the photographic expedition led by Arthur French, of Tacoma, was successful.

Many entertaining accounts have been written of these ascents. But they can, after all, convey little idea of the strange sensation of standing far above the clouds, the landscape below blotted out of sight, only the towering cones of distant volcanoes lifting their heads above the vast and gloomy expanse of mist; of peering over the brink of some eyrie crag down into far depths whose outlines are lost in obscurity, of feeling the earth tremble beneath your feet at the onset of some roaring, plunging avalanche; to be alone on the summit of an ether-piercing peak, amid trackless deserts of snow, miles above the precincts of animal or vegetable life, in a stillness that appals, with only the sky and the stars for a neighbor. Little wonder that the law-giver of Israel went upon the mountain top, for it is upon the lonely heights that seership comes, and the mind escaping from the narrow fetters of common life stands face to face with the immanent forces of the world.

SAVE THIS WONDERLAND FROM THE VANDALS.

Very fragmentary, I am aware, is the account here given of this marvelous land, but enough still remains, I hope, to indicate with sufficient clearness what a wonderland it is, and how unmistakable is the duty of Congress to add it to our national parks. That it has been withdrawn from public sale insures that it will not be captured by private interest, or that its matchless forests and exquisite scenery will not be destroyed by the encroachments of settlers or robber lumber kings. But this is not enough. The park is without hotels, without roads, almost without trails. A railway has been projected, the Tacoma and Eastern, and partly constructed, which will place the park within a delightful two hours' ride from the city. It will pass over a beautiful prairie, studded with numerous limpid lakes, by the side of countless foaming cascades and waterfalls, into the forest and up to the very foot of the mountain and the great glaciers. But at present, to behold the park's beauties one must undertake a genuine "roughing it" expedition.

But chiefly and of the utmost importance is the immediate establishment of a military patrol. Many a bare and offending spot betrays the work of a wanton fire, and many are the traces of vandalism to be seen. The temptation to watch the splendid conflagration of some stately monarch of the forest is too great, apparently, to be withstood, and the fire thus started is often of devastating effect.

It is for these reasons that Congress is urged to speedy action to the end that the region may be preserved intact and inviolate in all its unique and virginal beauty. Once in the government's care and made accessible to the traveler by means of the projected electric railway, its fame will widen with the years, and summer after summer in increasing numbers will our great army of tourists journey westward to the Pacific to take their stand before Tacoma's swelling dome and gain a new pleasure, a larger artistic sense, and a higher inspiration from the contemplation of the grandeur and beauty of this St. Peter's of the skies.

PROFESSOR JOHN TYNDALL: A CHARACTER SKETCH.

BY GRANT ALLEN.

IN John Tyndall the world has lost one of the prime leaders in the great revolution of the nineteenth century. He was the pioneer of enlightenment. In the history of civilization, the last fifty years will be conspicuous hereafter, not as the age when the slaves were freed in America, when Italy was unified, and when France and Germany relapsed into a recrudescence of barbaric militarism, but as the age when the thoughts of men were widened, the age of the triumph of the evolutionary concept. Far above all purely local or temporary facts must we rank that vast upheaval of the mind of man, whose consequences will endure and be felt in the world long after France and Germany have become geographical expressions. And in bringing about so profound a change in the thoughts and beliefs of his kind John Tyndall was by no means a secondary personage.

Twenty years ago, in speaking of this then still militant movement, most Englishmen at least found the united names of "Spencer, Huxley, Tyndall" come naturally to their lips. And they were quite right. As so often happens, that vague and diffuse popular intelligence which forms the locutions and usages of a language was far more correct than the separate intelligence of any one of its components would have been likely to make it. Even the succession of names in that once familiar trio was right and significant. The men were mentioned in the order of their relative importance.

Herbert Spencer, by far the greatest and widest-minded of the three, was the philosopher and organizer of the evolutionary movement; to him, and to him alone, we owe the very word evolution, and the conception of the thing itself as an all-embracing and consistent cosmical process. Huxley, again, was the biologist and popularizer; less philosophic and infinitely less cosmic in type than Spencer, the gods have

PROFESSOR TYNDALL.

dowered him with the gift of exposition; he could make things clear with his pen to the man in the street; while Spencer, too much occupied with the vast task of setting forth a synthesis of the universe and of human thought within a single lifetime, had no leisure to make them clear to any but scientific and philosophical readers. Tyndall, last of all, was the orator and the physicist. He had the gift of the gab. He could speak with tongues, where the other two could only think and write and permeate. And his adhesion as physicist was of the greatest im-

portance; for just at first, after Darwin dropped his destructive bombshell into the startled ranks of conservative science, the tendency of the physicists was to sit and look on—to treat this great revolution in science and philosophy as if it concerned the biologists alone, as if it were a question of a mere passing dispute as to the origin of species. At that critical moment, when worlds and systems trembled in the balance, Tyndall took off his coat, like a true-born Irishman that he was, and cast in his lot with the new school against the old, with the advocates of light against the shilly-shalliers and the obscurantists. That he

greatest and most typical man of science this century has seen when I speak in this way of him. It is no detraction to a great painter to say he is no sculptor, nor to a great poet to say he is no musi-

Hindhead
House.

HINDHEAD HOUSE, WHERE PROFESSOR
TYNDALL DIED.

did so redounds to his eternal honor, and will be hereafter, I believe, his chief title to recognition.

You will observe that in this trinity of evolutionary leaders I have not included the name of Darwin. I omit it, as the impersonal popular voice omitted it, for a sufficient reason. For Darwin's work, splendid and fruitful as it was, lay in different direction. These three men were philosophers as well as men of science—Spencer far most of the three, of course, and Tyndall least; but still, each in his own degree aimed at philosophic roundness and completeness of conception. Darwin did not. I don't think anybody will misunderstand me as endeavoring to belittle the

cian. So we may do with Darwin. He was a supreme and magnificent specimen of the biological specialist, and if he had not stuck to his *spécialité* with that infinite patience and that infinite capacity for taking pains about detail which constitute genius, the life work of the other three would have been far less possible. He knew his *métier*. It is to Mr. Spencer that the world owes the evolutionary revolution as a whole; but without Darwin to hammer home the cardinal truth of organic evolution with those repeated blows which the ordinary man can feel and understand, Mr. Spencer's system, even if fully expounded, might have had to wait for a century or

so longer before it gained adherents among the general public.

I am not going to apologize for this seeming discursiveness, because my object in the present paper is just to let Tyndall fall into line in his proper place in the general scientific history of our epoch. For this reason I shall dwell more upon his relations to other thinkers and other leaders of science than upon the mere personal details of his life and achievements.

John Tyndall was an Irishman. Much of his history is explained by that illuminating fact. The Celt was strong in him. People forgot too often how much Ireland contributes to the general life of our complex nationality. How many Englishmen are aware, I wonder, that Lord Kelvin (Sir William Thompson), Lord Wolseley, Professor Bryce, Oscar Wilde, Comyns Carr, Harry Furniss, Lord Dufferin—to take a few names at random out of many that occur to me—are every one of them Irishmen? About Tyndall, at any rate, there was never any doubt. He retained to the last no small physical traces of his Hibernian ancestry. He was born in 1820 at Leighlin Bridge, in County Carlow, so that his age marched, year by year, abreast with Herbert Spencer's. It is usual to say that he was of English descent, and I believe he claimed kinship with Matthew Tindal, one of the stoutest defenders of freedom of thought in the seventeenth century. That may have been so, and his ancestry in the direct paternal line may perhaps have been English. But those who know the ways of Irish Protestants well are aware of the tenacity with which many families cling to the vaguest shred of what they are pleased to call "Anglo-Saxon" descent. To be English in Ireland is like being Norman in England, or coming over with the "Mayflower" in Massachusetts. You will find scores of Irishmen bearing English names and boasting an English origin who are nevertheless as Celtic in type as the McCarthys or the O'Donohues. How could it well be otherwise? Mothers count in heredity for just as much as fathers; and members of English households which have settled in Ireland and intermarried with Irish women become in a few generations, as Gerald the Welshman (whom we absurdly call Giraldus Cambrensis) long ago remarked, "*more Irish than the Irish*,"—*ipsis Hibernis Hiberniores*. Certainly a family domiciled at Carlow, in the heart of Leinster, could hardly have failed to show traces of Irish blood. As a matter of fact John Tyndall himself was a thoroughgoing Celt in physique and in temperament. He had the iron constitution, the wiry strength, the reckless love of danger and adventure, the fervid imagination, the fiery zeal, the abundant eloquence, the somewhat flowery rhetoric, the tenderness of heart, the munificent generosity, which distinguish the character of his Celtic countrymen. Even the obstinate determination with which in later life he opposed, tooth and nail, the claim of his nation to national self-government was itself thoroughly Irish. He fought Home Rule with the vigorous spirit of the Kilkenney cats; for ever since Ireland was a nation at all, Irishmen have always been divided into factions and have

harried one another, unfortunately, with more bitter hatred than ever they have displayed towards the common enemy. No Englishman has ever shown the same hatred of Home Rule that has been shown by the Leckys, the Burkes and the Hamiltons.

Tyndall rose from the ranks, or very near it. He was one of those Irishmen whose industry, ability, and ancestral vigor enabled them to push their way boldly to the front through the most adverse circumstances. It is said, I know not with what truth, that his father was a member of the Irish Constabulary. Originally employed on the Ordnance Survey, the young fellow, accustomed to live on a pound a week, established himself for some years as a railway engineer at Manchester. But his love from the first was for chemistry and physics. Self-taught to a great extent, he was attracted in 1847, in his twenty-eighth year, to Queenwood College in Hampshire, where his friend Dr. Frankland, some five years his junior, was already employed as teacher of chemistry. Queenwood is a curious, isolated spot, where Robert Owen, the Socialist, built his Harmony Hall for the regeneration of humanity, and the picturesque brick building where Tyndall taught still bears on its face the falsified inscription, "C. of M." for "Commencement of Millennium." Harmony Hall, however, a century too early, had failed to regenerate humanity as Owen hoped, and the huge rambling building was turned into a middle-class college. Yet some flavor of socialism still clung about the place, the principal of the college, a wide-minded Quaker, had Owenite sympathies, and I fancy some emotional leaning towards the new doctrines co-operated with Frankland's presence to draw Tyndall's attention towards the struggling institution. He was teacher of physics at Queenwood—and learner of physics also. It was here indeed that his original researches began. The college was progressive, and Frankland had set up in it the first practical laboratory ever introduced into a school in England. This engagement proved to be the turning point in Tyndall's career; it diverted him from the practical work of engineering into the more congenial paths of abstract science.

He remained but a year at Queenwood. In 1848 he and his colleague Frankland threw up their appointments in the Hampshire School and went to Germany to study at Marburg, where Bunsen's laboratory was then the most live thing going in chemistry. It is not every young man of twenty-eight who cares to make such sacrifices in the cause of learning. Under Bunsen, Tyndall learned much. His German training did marvels for him; that Teutonic schooling in method helped largely to counterbalance the natural weak points of the Celtic temperament. He retained to the last his Celtic vividness of insight, and it is to him that we owe that familiar phrase, "the scientific use of the imagination," of which he was at once the prophet and a great example. But he yielded to a few German men of science in the thoroughness of his procedure and the patient care he devoted to investigation. His observations on glaciers extended over months and years of waiting and watching,

ments. The relations between the two thinkers were very close and cordial, in spite of profound religious differences, and Tyndall afterwards wrote the biography of his friend, which is probably one of his most popular writings.

It was at the Royal Institution that Tyndall became really a power in the land. Endowed with a marvelous gift of clear presentation, and with a rare faculty for holding the interest of an audience, he was soon recognized above all things as the popular exponent of physical science. When one comes to ask, "What one great work did Tyndall perform in life?" it would be difficult for any man to give a definite answer. He advanced many branches of science in certain directions; but, for the most part, those directions had been amply indicated beforehand by others. His observations on glaciers took up the varied threads of Agassiz, Forbes and Faraday; his researches on heat were in the direct line of Count Rumford and Joule and Melloni. It is the same throughout. We cannot say of him that he gave us any one great conception, like natural selection or

the conservation of energy; any one great discovery, like spectrum analysis or the meteoric nature of comets; any one great invention, like the telephone or the phonograph. But his personality and his influence were pervasive and important; his powers of exposition were in every way remarkable; and his investigations, though never quite reaching the first rank in value, stood very high, indeed, in the forefront of the second. Above all, London, that great heterogeneous London, accepted him frankly as the representative physicist. Of Joule, of Thompson, of Tait, of Clerk Maxwell, of Balfour Stewart, it knew little or nothing personally; even Helmholtz was to it but a great distant name. Tyndall was there on the spot, audible and visible. He was the Royal Institution. He was also physics. This counted for much when the day of battle came, and when the

while his researches into the minute germs which float about in the air could hardly be surpassed for delicate carefulness and scientific precision by the most ponderous of Teutons.

At Marburg and at Berlin Tyndall's serious work began with his investigation into diamagnetism and the magneto optic properties of crystals. It was not so hard then as it is now for a rising man to attract attention; and before long his efforts were rewarded by a Fellowship of the Royal Society. On his return to England he was appointed, in 1853, Professor at the Royal Institution, where Faraday was then engaged on his great electrical and physical experi-

forces of darkness were gathered together to crush down the forces of light in the sixties and seventies. While the orthodox physicists of the universities and of the north were willing to stand aside and let the biologists bear the whole brunt of the battle, Tyndall, who to London was the representative physicist, gave the weight of his name and his personal importance to the side of the evolutionists.

Tyndall's action in this matter was no doubt largely influenced by his close personal association with Spencer and Huxley. Both those thinkers influenced him deeply. In 1856, Huxley and he went to Switzerland together, and there began those observations on glaciers which finally resulted in their joint work on the structure and motion of those moving ice-rivers. Later still, when the International Scientific Series was projected, Tyndall popularized these investigations in his charming little book on "Forms of Water." Meanwhile, the evolutionary wave was gathering force and volume. Darwin had long been prosecuting his researches into the origin of species, but as yet had published nothing on the subject. Herbert Spencer, who had already proclaimed himself a thorough-going evolutionist, was at work on his great scheme of the "Synthetic Philosophy." Lyell was pursuing his investigations into the antiquity of man. The new ideas were in the air. At last, in 1859, the wave which had been so long advancing curled and broke visibly. Darwin, on the crest of the movement, published in that year his "Origin of Species." It was the greatest epoch in science since Newton launched the theory of gravitation. Immediately the thinking world was divided into two sides. Owen and most of the physicists were in open opposition. Huxley and Hooker gave in their adhesion instantly. Lyell hesitated and wavered, but, soon convinced, accepted the new views as the necessary complement of his own uniformitarian concept of nature. At this crisis it was highly important to the evolutionists that students of biology and geology should not seem to stand alone in their acceptance of the new doctrines. Tyndall came boldly out among the physicists at the moment of need as the ally and champion of the rising movement. His aid was invaluable, and did much to help forward the triumph of that school of thought which is now for all practical purposes universally accepted. A few elder men still huddle and doubt; the younger generation, whatever science they may take up, are to a man evolutionists. Indeed, the very rapidity and certainty of the victory has made the men who gained it half outlive their fame; thousands of people who now implicitly accept modern views of life hardly know how much they owe them to Darwin, Spencer, Huxley, Tyndall.

Yet, while the battle was raging, Tyndall was quietly going on with his work as a mountaineer, or his laboratory researches at the Royal Institution. The Alps were his playground. He was the first who ever climbed the Weisshorn. He loved the mountains with an almost boyish love, which mingled strangely with his scientific ardor. Questions as to the glaciers

and as to the heat which fell upon them ultimately resulted in his researches on radiation, perhaps his most valuable contribution to science. In 1860, a year after the Darwinian era, he produced his book on "The Glaciers of the Alps;" in 1861 his "Mountaineering;" and in 1863 his popular work on "Heat as a Mode of Motion." Through the sixties he worked hard for the most part at his investigations on radiant heat, finally published in his admirable volume of "Contributions to Molecular Physics." But 1874 was the culminating year of his fame and reputation. The British Association met at Belfast; there, among his Protestant Irish fellow-countrymen, he threw down the gage of battle to old-time orthodoxy in his famous presidential address. No scientific utterance of our time aroused so much comment or such bitter controversy. "Rank materialism" people said at the time—not knowing for the most part what materialism meant; and, indeed, though it might well be doubted whether any man capable of understanding the word was ever a materialist, it must be confessed that Tyndall's language gave a greater handle for the foolish accusation than that of his more philosophic colleagues, Spencer and Huxley. To call Mr. Spencer a materialist, indeed, is about as ridiculous as to call St. Augustine an atheist or Martin Luther a strenuous Papist. There are materialists by the thousands around us in England, but it is not in the ranks of the thinkers or philosophers that we shall have to look for them. They sell short in the city or slaughter grouse on purple moors in the Highlands. However, the cry was raised, and the address was tussled over with all the energy of theological and scientific combatants. The struggle put Tyndall for the time being in the forefront of the new faith and identified him closely with the other leaders in the evolutionary movement.

From 1867 Tyndall had been superintendent of the Royal Institution. His researches on radiation led straight to those on the acoustic properties of the atmosphere. From this he went on to his investigations of the floating matter in the air, largely suggested by Pasteur's discoveries in bacteriology. All his life long he had loved the heights. His *chalet* on the Bel Alp is probably one of the highest-perched inhabited dwellings in Europe; and his discovery of the comparative absence of the germs of decomposition on hill-tops seems to have given him a positive distaste for low-lying valleys. The thirst for pure air soon grew to be a passion with him. And indeed it is a taste which waxes apace with indulgence. Just as the close atmosphere of an ill-ventilated room is unendurable to those of us who have accustomed ourselves to open windows and airy surroundings, so the muggy and germ-laden atmosphere of low-lying valleys is unendurable to those who have long breathed the pure, fresh ozone of the unpolluted mountains. In 1883 Tyndall gave up all his London appointments and retired forever from the thick pea-soup air of the squalid village, where evil organisms fly about to spread disease and decomposition on every breeze. He had built himself a house, four

square to all the winds of heaven, on an open heather-clad moor that covers the summitt of Hind Head in Surrey, just five hundred yards from the spot where these lines are being written. It is a beautiful situation, absolutely unembarrassed in every direction, and the eye looks forth from it upon a surging panorama of fifty miles radius, from the South Downs on one side to the North Downs on the other. His time henceforth was divided almost equally between Hind Head and Switzerland; he spent his summers on the Bel Alp and his winters in Surrey. Both situations afforded him that wide outlook upon external nature which he so greatly enjoyed; for his love of scenery came only second to his love of science, with which indeed it was inextricably intermingled.

It would be impossible wholly to omit reference here to the political discussions which occupied so large a space in his last few years. The part which he took on the question of Home Rule I have always largely attributed to the influence of Carlyle, the evil fairy of the last half century. Liberal in fibre and progressive in most directions, Tyndall had the misfortune to be born an Irish Protestant. Now Protestantism in Ireland has long been an aggressive exotic, maintaining itself as the creed of a dominant caste by sheer main force for two hundred years among a hostile people. The consequence is that Irish Protestants retain for the most part a painful attitude of undisguised enmity toward their genial and tolerant Catholic fellow-countrymen. Those who have mixed with the leaders of Irish thought must have been struck by the strange contrast between the breadth and catholicity of the Catholics on the one hand and the bigotry and intolerance of the Orangemen on the other. Now, Tyndall came to England essentially an Orangeman. Had he mixed with liberal Englishmen only it is probable he would have got rid in time of his Irish prejudices, like so many more of us whose Irish Protestant descent has not interfered with the development of our political principles. But the adverse influence of Carlyle confirmed him in all his original preconceptions. When the great split came Tyndall took the wrong side and fought for it with all the obstinacy and vigor of his Protestant Irish nature. Those men are fine fighters: for good or for evil they stick to their flag with their favorite cry of "No surrender!" Tyndall stuck to his like a man; to one who had fought so hard on other fields for the cause of freedom that last relapse may surely be forgiven—especially by those who see victory before them.

And, indeed, it is noteworthy that all the men of that first generation who spread the evolutionary doctrine among us are now reactionary in politics. The younger brood whom they trained have gone on to be Radicals, Fabians, Socialists. But the elders stayed behind when Home Rule came to the front, and remain bitterly hostile to the Socialism of the future. Each generation finds the conclusions drawn from its premises by the men who succeed it go a great deal too far for it. And yet the germs of land nationalization, and of that extreme individualism which can only be

realized in a Socialist commonwealth, were derived direct by most of us from *social statues*.

Of Tyndall the man I have little right to speak. I will only say that one Irish trait of character—a princely generosity—was known, against his will, to all who knew him. Numerous instances of this quality have come to light since his death; many others are only recognized by the few who were connected with the distribution or reception of his bounty. One case on a large scale, which is publicly acknowledged, was his devotion of the immense sum derived from the proceeds of his lecturing tour in America in 1872 to the foundation of scholarships for original research at Harvard and Columbia.

What was Tyndall's place in the movement of our period? Every great onward march of the human mind is like a wave on the ocean. It begins small, gathers strength and volume as it grows, and breaks at last in a conspicuous crest, visible to all men. It was so with the evolutionary movement. Erasmus Darwin sowed; Buffon, Lamarck, Robert Chambers, watered. In the fullness of time Charles Darwin, Herbert Spencer, Alfred Russell Wallace, came to crest the wave. But evolution existed before Darwin, and Darwin himself was but the man who finally made a rising cause triumph. It is the same, once more, with the other great generalization of our age, the conservation of energy. In a certain dim sense, Kepler, Newton, Laplace, saw the way that led towards it. Count Rumford had clearer glimpses of it. With Grove it began to take definite form. Joule, Helmholtz, Clerk Maxwell, Balfour, Stewart, consummated it. But to no one man can the glory be given. More and more, as time goes on and co-operation increases, is this the case with science. Nobody can really say in one word who invented the steam-engine, the locomotive, photography, the telephone. People who know nothing about it will tell you glibly enough: Watt, Stephenson, Talbot or Daguerre, Bell or Edison. People who know more about it know that many separate inventors contributed many separate parts to each of these inventions; and most of these parts could only be explained to technical readers.

Now, Tyndall was one of those men who bear a large share in the actual technical work of such great discoveries. But it is hard to put one's finger upon any single point easily to be apprehended by the ordinary intelligence. He taught us much, for example, about the way radiant heat is propagated through the atmosphere; about the objects which are, so to speak, opaque or transparent to it; about the effects it produces on the surface of our planet. He taught us much about how glaciers are formed, move, and are retarded, break into crevasses and freeze together again, compress themselves through gorges, or spread themselves, though solid, into lake-like expansions; and he did more towards explaining these singular phenomena than any other observer. His contributions to the sciences of light, of sound, of electricity, of magnetism, of heat, and even of biology (so far as regards the diffusion of the germs of minute organ-

isms), are all of them most valuable. He was a fellow-worker in the triumph of evolutionism and of just and sound views about energy. But for the most part he led up towards those great developments in physical and electrical knowledge which have not yet been made, and towards practical inventions which have not yet been invented. This sort of work is the most valuable of all, but it is often the most inglorious. So it comes about that Tyndall, who was himself a most careful, accurate and patient investigator, was best known as a popular expounder and an almost sensational orator. He would not have been so famous if he had not superadded Belfast addresses and Royal Institution lectures to his real work in the laboratory and on the mountain.

In these addresses, indeed, we get the man himself at his highest development. Tyndall was not a materialist. The city and the west end are full of materialists, who think the universe consists entirely of matter, with a material heaven and a material hell, and with material spirits more or less pervading it. They think they themselves have souls, but that the universe at large is inert and lifeless. Against this gross materialism of the world Tyndall, like all other thinking men, revolted. He was impressed with the infinite mystery and majesty of the cosmos. He did not believe a mass of matter was only a little sense-

less dirt. He saw in it the interaction of mighty forces, cohesive and gravitative; he saw in it the activity of incident energies, the undulations of molecules which we know as heat, the play of ethereal waves which we know as light, the marvelous polarities of magnetism, the subtle flow of electric agencies. The universe to him was full of terrible, and often as yet inexplicable, factors. Every atom of matter was instinct, in a way, with life, and possessed strange attractions and repulsions towards all its neighbors. Not quite so deeply spiritual as Herbert Spencer, not so prone to dwell upon the unknowable or to inquire into the elusive relation between the knowing and the known, Tyndall lived rather in the region of the phenomenal. But within that region the mystery of things loomed large before him. No man had ever a profounder conception of the ultimate atom, its nature and its powers, its sympathies and antipathies, its forces and its energies. Few men have looked deeper behind the world of sense and illusion into the impalpable verities which constitute the universe. The charge of materialism could only be brought against such a man by those abject materialists who have never had even a glimpse of the profounder fact that the universe as known to us consists wholly of mind, and that matter is a doubtful and uncertain inference of the human intelligence.

Professor Tyndall's study.

RELIEF MEASURES IN AMERICAN CITIES.

(Continued from Last Month.)

IN continuation of our report last month upon the unemployed in a number of leading American cities and the measures which had up to the middle of December been entered upon for their relief and maintenance, we have taken pains to secure for the present issue of the REVIEW a series of reports from the best authorities in a much greater number of important centers of population and industry. In almost every case our information has come from the pen of the Mayor, or from some one designated by him as especially qualified to make a correct and intelligent statement. It would be interesting, on many accounts, if our very admirable series of statements from the different cities could be published in full. But obviously the exigencies of space in a periodical which makes condensation and summary treatment its rule, will prevent any elaboration of detail. Most of the information given is as recent as January 15.

BOSTON'S METHODS.

Our remarks last month upon the difficulty of anything like a statistical estimate of the number of wage-earners out of work in the United States have had abundant further illustration. Thus we gave the Andover House estimate of at least forty thousand men out of employment in Boston, based upon what was claimed to be careful investigation. *Bradstreet's*, in a recent report covering this one point of the number of unemployed, places the Boston figure at thirty thousand. But a census taken under the direction of the Police Board has reported only fifty-three hundred men in Boston to be out of work. This would indicate either that there has been a great change for the better, and that many men transiently idle have now found jobs, or else that estimates and census returns are exceedingly deceitful. The burden of opinion would seem to be that the police census was very incomplete and that the actual number is much greater than five thousand. However that may be, the municipal authorities and the citizens' relief agencies of Boston seem now to have a good command of the situation. Although the city has not entered upon the policy of spending large sums in public works for the avowed purpose of affording employment, it is, on the other hand, doing a very unusual amount of work in nearly all the departments. Thus a dozen public buildings of one character or another are under construction, and a vast amount of miscellaneous work upon the streets, sewers and parks is employing a much greater number of men than is usual at this season. The citizens' relief committee, constituted in the most representative way, as explained by us last month, has its headquarters in a vacant building provided by the municipal authorities, and up to the middle of January it had

collected fifty thousand dollars in private contributions, this money being used to keep some three hundred and fifty men and seven hundred and fifty women in employment. It is gratifying to observe that the Boston committee is doing so much for women. It is probably more true of Boston than of other cities that women wage-earners need particular consideration. For it happens that the clothing trades and various clerical occupations are those which are suffering most in Boston, and these employ a very high percentage of women wage-earners. Ingenious plans have been carried out for giving these women kinds of work that do not compete with existing industries. The several hundred men furnished with work by the relief committee are cases carefully selected, and the city is employing them in doing certain kinds of sewer and city work which could be done less expensively in the summer time. The municipal authorities pay up to the point of summer cost, and the citizens' committee pays the excess. This rather novel plan seems to work well. It enables a small relief fund to help a much larger number of men than would be possible if the total wages were paid by the citizens' committee. Of course it should be added that almost innumerable private charities of every description are unusually alert and useful at this time in Boston, and that the greater part of the suffering among the poor is alleviated by means which never come to the notice of the city authorities or the more public central relief agencies.

THE LYNN PLAN AGAIN.

As remarked in our report last month, the relief plan in vogue at Lynn, Mass., has attracted much attention. We are glad now to make some further report upon the working of these very desirable arrangements. Lynn had the advantage of having Associated Charities with some trained investigators, and a new public park comprising nearly two thousand acres, mainly of wild and totally unimproved woodland. The Lynn relief fund was started by a leading merchant, who gave a thousand dollars for that purpose in September. The citizens' committee was promptly organized, and its work has been done primarily through a Labor Bureau. Every applicant at the bureau has answered questions as to his last employment, length of residence in Lynn, how long he has been out of work, and how many are dependent upon him. His case is then immediately verified by an investigator, and if he meets the conditions, which are of a very simple character, he is given an employment card good for three half days' work in the public park,—which work when performed entitles the holder to one dollar for each half day. Two

gangs have been employed, one on Monday, Tuesday and Wednesday forenoons, and the other on Thursday, Friday and Saturday forenoons. Two dollars per day is the prevailing wage rate for outdoor work in Lynn. It has been the policy of the citizens' committee to treat every man employed on relief work, as to management and payment, exactly as any other man employed in outdoor work would be treated. It is explained by our correspondent, Mayor E. B. Hayes, of Lynn, that the men are employed in cutting out underbrush in the park, burning it, cutting down dead and undesirable trees, and carting the wood thus obtained to a wood-yard, where elderly and feeble men are employed under shelter in making kindling wood. Another force is employed building roads and cutting paths in the park. For the week ending January 13 the pay roll amounted to a little more than thirteen hundred dollars, and the citizens' committee was furnishing between four and five hundred families with three dollars per week earned by the bread-winner under this plan. No man works more than his three half days per week, and thus each has the remaining nine half days in which to do anything that he can. Mr. Hayes explains that in this plan there is no assault made upon normal wage rates. He thinks it would be a very doubtful kind of charity that would adopt a plan to lower the existing rates, and he believes in short days at full rates instead of full time at low rates. The Lynn plan has afforded relief without encouraging pauperism; it has given a kind of work that has not interfered with any kind of existing business furnishing regular employment, and it has prevented actual want without giving employment that would tempt men to leave other work or to remain longer than absolutely necessary. The short days, moreover, have enabled men unaccustomed to out-of-door work to perform the allotted tasks without injuring their health.

RELIEF IN WORCESTER.

In Worcester, Mass., a relief committee of nine was formed in October, the Mayor being its chairman and the nine being composed of three city officials, three representatives of the Worcester clergymen selected by the clergy themselves, and three representatives of the Associated Charities. Its plan was to dispense work, and also to distribute coal and provisions where necessary. Worcester has a great variety of industries and it has suffered perhaps less than some other manufacturing towns. Nevertheless, its number of unemployed is very considerable. The majority at first were able to draw upon past accumulations; but as the winter has proceeded the demand for relief has constantly increased. Over five hundred families had been assisted by the citizens' committee with gifts of fuel and provisions up to the middle of January, although the fund disbursed for that purpose did not aggregate a large sum. It is now reported that the municipal authorities have issued a loan of four hundred thousand dollars in the form of four per cent. bonds, taken up at home by business men, and that

this fund will be expended upon public improvements for the sake of giving increased employment. This was in accord with the recommendations of Mayor Marsh, and was not done until all the funds available for emergency work on the streets had been exhausted. It is believed that the proceeds of this loan will enable the city, with the aid of the churches and various charitable organizations, to tide over the season.

OTHER MASSACHUSETTS CITIES.

In Springfield, Mass., also the question of issuing bonds for the undertaking of comprehensive schemes of public improvement has been agitated, but nothing definite has been done in that direction. Meanwhile the city has been doing a very considerable amount of street and park work in excess of what is usually done in winter, and several hundred men have been kept at work. Mayor Kendrick discusses the problem of the unemployed as applied to Springfield very intelligently in his message of January 1, as do also several other New England Mayors. The Union Relief Association of Springfield and other charitable and philanthropic organizations have kept in close touch with the needy, and the situation does not seem to offer exceptional difficulties.

The retiring Mayor of the city of Holyoke, Mass., reports that the city government has been keeping in employment from one hundred to three hundred men in building sewers which would not have been built until next summer, under ordinary conditions, and he adds that the provision of exceptionally large amounts of municipal work is contemplated for the remainder of the winter. The relief associations, under the auspices of the churches and other charitable societies, have accomplished much, and we are informed that the private employers of Holyoke are straining every point to keep their men at work. It is gratifying to have this last bit of information. Of more than one city it may truthfully be said that a considerable proportion of the relief required might be obviated if employers were more ingenious in contriving ways to give at least partial work to their men, and if they felt a deeper sense of responsibility.

A very recent police canvass of the city of Cambridge has reported seven hundred heads of families out of employment. Mayor Bancroft in December urged the city council to undertake emergency work if possible, and as a consequence about two hundred men were employed in January. At the Mayor's call a relief committee of ten citizens has now been appointed, and the Associated Charities have established a provident wood-yard. Mayor Bancroft informs us, as have a number of Mayors in other cities, that ordinary unskilled laborers,—men who work with a pick and shovel,—are little if any worse off than usual, while those who suffer most are mechanics or persons usually employed indoors. But for this important fact, the plan of relief through street and outdoor work would be a much more perfect one than it is.

The number of the unemployed in Fitchburg, Mass., is variously estimated at from five hundred to one thousand. The City Clerk, writing for the Mayor,

informs us that two hundred and fifty men are being employed in the construction of new streets as an aid in alleviating the present distress, and that several new public buildings are to be undertaken at once. The citizens' organization known as the Benevolent Union is dealing with the local situation upon the same general lines as citizens' relief committees in various other cities. The purport of the information from Fitchburg is a strong sense of municipal concern and responsibility, and a disposition to provide whatever relief may be needed.

Lowell seems not to have entered upon as distinctive and highly organized methods of relief as many other cities; but the churches have been brought into close and harmonious action as a result of the obvious needs of the season, and their united efforts have secured a considerable relief fund which is providing for the worst cases.

EFFECTIVE CO-OPERATION IN MANCHESTER, N. H.

Mayor Knowlton, of Manchester, N. H., estimates the unemployed in that city at five hundred. Few cities in the country have organized themselves so effectively and well for relief purposes. Late in the fall the city raised by temporary loan twenty-five thousand dollars for the purpose of giving increased employment in various city departments. The plan has been adopted of dividing the laborers into two or three forces, the effort being made to give to each person two or three days' employment per week, and thus to secure to a much greater number of families at least enough income to buy food. The Manchester Board of Overseers of the Poor is composed of one member for each of the nine wards of the city, and this arrangement permits close personal investigation. Manchester has a Rescue Mission which provides substantial meals for five cents and permits no one to go away hungry. Other private mission and charity enterprises co-operate in such a way as to carry judicious relief into the homes of all who are in distress. It is a pleasure to learn of relief measures, public and private, so harmonious in their working and so effective.

REPORTS FROM MAINE.

From the manufacturing towns of Maine our reports do not indicate very exceptional distress, or any very striking instances of municipal action for relief purposes. The Mayor of Portland deprecates much publicity with regard to the situation, and believes that for his own city the best way to meet the wants of the deserving is to supply them with work through the agency of Associated Charities and the municipal street department, as well as by private effort, and to avoid anything like a public dispensation of charity, which so frequently misses its intended mark.

Augusta reports no wage earners idle,—a very remarkable showing for this bad year.

Bradstreet's agent reports a thousand idle workers at Lewiston, but Mayor Chandler informs us that "most of the mills are in operation on reduced wages, and the numbers of unemployed are few compared with many other cities." He says that nothing has

been done in a public way except to spend a few thousand dollars on streets and sewers. Doubtless the charitable societies of Lewiston have not been idle.

Seven hundred idle workers are reported from Auburn, but, as Mayor Bolster explains, a large proportion of these are shoemakers who own comfortable homes and have means of present support. "Comparatively speaking," he adds, "there are but few of the unemployed who need aid." Mayor Bolster, in common with authorities in other New England towns, reports an uncommon number of vagrants in jails or workhouses.

In Rockland the relief is dispensed, according to Mayor Knight, by a charitable association which includes in its membership nearly all the well-to-do men and women of the place, each of whom pays a dollar a year into the treasury to form a working nucleus. Ladies' committees canvass thoroughly, and dispense much relief in the form of food, clothing, fuel, and the like. No necessity seems to have been recognized as yet for exceptional measures to provide work.

CHARITY IN PROVIDENCE.

Providence, Rhode Island, is another of the cities about whose statistics of the unemployed the reports have widely varied. Thus, *Bradstreet's* estimate places the number at ten thousand, upon whom forty thousand persons are dependent. But we are now informed from the Mayor's office that a fair estimate places the number of the unemployed at about four thousand, with about twelve hundred families in actual need. But the number is said to be increasing. The Commissioner of Public Works has adopted the plan of employing two gangs of men working alternate weeks. He employs heads of families as far as possible, and this plan gives half time work to twice the number who would otherwise be engaged. It is expected that the City Council will authorize the Commissioner to undertake much additional work which in ordinary circumstances would not be begun until the approach of summer.

Providence has a great number of charitable societies and organizations which are exerting themselves at the present time, and whose work is brought measurably into harmony through the investigations and oversight of the Society for Organizing Charity. A very thorough house to house work among the poor seems to be in progress in Providence, resulting in the distribution of large quantities of food, fuel and clothing. The distribution among the poor of the cast-off garments of the rich or comparatively prosperous classes is a mode of relief that requires great care; for it is attended with the danger of causing humiliation and of promoting the spirit of pauperism. But in times of great distress like the present winter, there can be the good will on both sides that redeems almsgiving. In Providence there has been going on during the past month through the agency of the Overseer of the Poor and the active efforts of the press, an enormous distribution of clothing.

SEVERAL CONNECTICUT CITIES.

Mayor Bentley, of New London, informs us that while the pressure of hard times was not experienced in his city so early as in the manufacturing centres, yet the depression is now felt with greater severity than ever before in New London's history. At first the work of relief was left to individuals, churches, charitable societies, and the city mission with its wood-yard, the municipal departments meanwhile endeavoring to give as much employment as their limited means would permit. More recently, however, the Common Council has been authorized by popular vote to appropriate eight thousand dollars for the purpose of giving relief employment in street, park, and other public work.

In Bridgeport, also, eight thousand dollars has been appropriated by the city for working new streets, with the express intention of providing for the unemployed. Mayor Bostwick informs us that he will take steps to urge upon the Council further appropriations for the same purpose. The charitable organizations of Bridgeport seem to be doing their part with zeal, but the situation is regarded by the Mayor as difficult and serious.

The distress that would in any case have been felt in the manufacturing town of Danbury has been enormously augmented by the protracted and disastrous disputes which have caused a lock-out of many hundreds of hat-makers. The attempt some weeks ago by a popular vote of the unemployed themselves in town meeting to secure a large appropriation of public money to be dispensed in direct relief, has been much commented upon by the newspapers.

THE SITUATION IN NEW YORK CITY.

For New York City, where undoubtedly the need of relief is far greater than anywhere else in the United States, and where a most disproportionate amount of the country's wealth is concentrated, we must regretfully state that there is little to report in addition to the meagre statement made last month. On January 15 a reliable New York newspaper sent to a number of gentlemen a letter which made the following statement: "A careful investigation shows that out of 109,000 unemployed in this city, only 600 are being given work by the charitable organizations. No public effort whatever has been made here to furnish employment to the sufferers from the present depression, although in 1857, when only 35,000 were out of employment, \$250,000 was appropriated by the city and spent in furnishing work for the unemployed." Several days later the East Side Relief Work Committee, which has thus far been the principal employment furnishing society, announced that it had 500 men employed, and that it expected within a few days to bring its total number of workers, men and women, up to seven hundred and forty. The five-cent restaurant movement has very considerable extension and is evidently furnishing much practical aid to the poor. A number of relief funds have been inaugurated, none of which has collected an amount that can truthfully be called considerable in proportion to

the dimensions of the distress to be relieved; and their aggregate is a mere pittance in comparison with the funds secured in several small cities. Different newspapers have been energetic in special lines, one paper collecting money for a free bread distribution, another for a free clothing distribution, and still another for a free fuel distribution. In view of the amount of real suffering that exists in New York, the otherwise objectionable almsgiving that has been chiefly characteristic of the relief work thus far cannot be condemned. For surely the hungry must be fed, the naked must be clothed, and the freezing must be warmed, during the time that elapses before some employment plans on a large scale are available. There was pending at Albany when this statement was written (January 20) a bill to authorize the municipal authorities of New York City to expend \$1,000,000 in providing public work to meet the special necessities of the unemployed. It can hardly be doubted that this measure will have been duly passed and that steps will be taken to make it practically effective before this number of the REVIEW reaches its readers. But in addition to what the city can do there is especial need of generous contributions to those relief committees which are in a position to deal with the classes for whose rescue the heavy street and park work could not in any case be made available.

BUFFALO'S RECENT MEASURES.

The *Bradstreet's* estimate for Buffalo was 15,000 workers out of employment, upon whom 40,000 persons were dependent. In a recent statement from the office of the Mayor, however, we are told that 5,000 is a fair estimate, and that of this number at least 3,500 are laborers who are unemployed every winter by reason of the character of their work. The past summer, however, did not afford them as much labor as usual, and they are not so well provided with the means to tide them over the winter. Buffalo did not find it necessary to take unusual measures for relief until about the middle of December. Since that time active and effective work has been done. The city government will have expended about \$100,000 more than usual during the winter for municipal improvement in order to give work to the unemployed, and a citizens' committee is raising \$100,000 by subscription to expend for labor upon enterprises not of a purely municipal character,—employment being given after an inquiry similar to that which the municipal authorities make as to the needs and deserts of the applicants. The *Buffalo Courier* has been promoting an especially meritorious movement to supply the immediate wants of men out of work, and of families where, through the illness of the bread-winners or some other special misfortune, there is need of prompt assistance. Altogether, Buffalo seems to be in full command of the situation.

ROCHESTER, SYRACUSE, ELMIRA AND UTICA.

Mayor Curran, of Rochester, informs us that up to the middle of January no special methods for the relief of the unemployed had been adopted in that city,

except that the Street Department had been furnishing constantly increasing work for those seeking employment. But inasmuch as the number is constantly increasing, Mr. Curran regards it as evident that Rochester must initiate some further improvements, such as the construction of sewers, the laying of water mains, and so on. Although *Bradstreet's* reports a pretty large number of men out of work in Rochester, the Mayor is of the opinion that the recent business depression affected Rochester less than other cities of its size, and that it will be quite possible to get through the winter without any serious distress.

Mayor Amos, of Syracuse, presents a hopeful picture of the situation in his community, although *Bradstreet's* reports the enormous total of 10,200 people out of work, upon whom 41,000 persons are dependent. The Mayor thinks that Syracuse is hardly as badly off as other cities. Sewer and pavement work kept the laboring classes occupied until late in the fall and considerable municipal work is now being performed on the plan of three days per week. A relief fund of \$5,000 or more has been secured by public subscription, and the Bureau of Labor and Charities is reported as looking well after the unfortunate, the city being divided into small districts in which close investigation is possible.

Elmira's Mayor, Mr. D. C. Robinson, also reports in a cheering tone. He says that the distress in Elmira has not been such as in the judgment of those most interested in charitable work to demand action by the city authorities. The churches and benevolent societies are, however, greatly increasing their activity in the direction of providing food and clothing for the destitute, and it is expected that such efforts are likely to suffice unless the situation grows materially worse during the next sixty days. The work of the Municipal Overseer of the Poor is so highly approved that much money raised by entertainments and other forms of charitable effort is turned over to augment his resources.

Mayor Wheeler, of Utica, writes briefly that no steps have been found necessary toward exceptional charity in his city. Private charity and the ordinary work of the City Charity Commissioners are considered quite sufficient. This is particularly agreeable information, because a very large number of unemployed men had last month been reported from that place.

RELIEF WORK IN BINGHAMTON AND YONKERS.

The almost uniform report of comparatively prosperous conditions that has come to us from the interior cities of the State of New York is quite fully sustained by the information which Mayor Green, of Binghamton, kindly sends us regarding the condition of his city. He admits that an unusual number of people are out of employment and that considerable suffering is reported, but declares that throughout the period of the hard times the industrial and financial interests of Binghamton have been practically undisturbed. A citizens' relief committee has, however, been formed under the Mayor's ap-

pointment, and it is now working actively in unison with the several charitable organizations previously in existence. The plan has been adopted of securing pledges for various amounts from those who are able to contribute, the favorite plan being to secure promises of a certain amount per month, the monthly sums ranging from ten cents to twenty-five dollars until next May. A wood-yard has been established as a feature of the active work now occupying the relief agencies, and it is expected that all serious distress can be relieved as cases are discovered.

In Yonkers, on the Hudson, a manufacturing suburb of New York City, with a population of 35,000 and great carpet works and other industries, the necessity of relief measures was felt early in the fall, on account of the temporary closing of factories. Mayor Weller in October assembled the representatives of all the churches and organizations at the City Hall, with the result of forming an influential central committee for the relief of the needy and unemployed. This committee has been successful in all the branches of its work. It has secured large contributions of money and of supplies, has carefully investigated the needs of the community, sifting the deserving from the undeserving cases, and has accomplished a distribution of relief that has prevented the extreme suffering that otherwise must have ensued. Fortunately, conditions of employment in Yonkers seem to be improving.

THE NEW JERSEY MANUFACTURING CENTRES.

As to the New Jersey manufacturing towns, a large number of men are reported as out of work at Newark, but no report of relief measures has reached us from that place.

From Paterson, however, we have a highly interesting account from the pen of Rev. John H. Robinson, who is president of the Paterson Relief Committee,—the admirable organization by which the poor of that city have been cared for. In Paterson, which is a city of mills and operatives, no great amount of relief through municipal employment has been considered feasible. The Mayor some weeks ago called together a representative meeting of citizens and appointed a large relief committee including members of all denominations and elements. The chairman of this committee and general director of relief work is Mr. Robinson, from whom we have the information. Mr. Robinson acted in the same capacity for the Paterson relief movement of 1873, which was exceptionally well conducted. The city of Paterson is now divided into thirty-seven districts. Lady visitors in sufficient number have been appointed for every district. A large central depot for the distribution of food, clothing and other supplies has been established, and relief is dispensed three days in the week to applicants who bear with them credentials furnished by the lady visitors. Special investigating committees selected from the membership of the general relief committee assist the lady visitors by determining all doubtful cases. A purchasing committee does its work so well that it is

found possible in Paterson to furnish sufficient food to maintain hungry families at a cost of four cents per day for each adult. The movement is so complete and representative that contributions have come in without urgent solicitation, and there is every reason to believe that the emergency can fully be met by this means. The entire body of lady visitors meet the central relief committee once a week at the City Hall for consultation and report. Apart from the immediate necessity which has thus brought Protestants, Catholics, Jews, and those belonging to no religious body into harmonious intercourse and co-operative work for the suffering, such a union of the well-disposed and humane can but have far reaching effects for the well-being of the community.

Mayor Wescott, of Camden, reports few factories closed down entirely. He informs us that some employers are keeping men at work at a constant loss to themselves. The City Council has appropriated a few thousand dollars as an extra fund for the use of the Overseers of the Poor. Camden has now also an association of citizens for purposes of relief, with a canvassing committee of five citizens in each ward and a central executive committee of nine through whom the proceeds are distributed. The churches and benevolent societies, in Camden, as elsewhere are making unusual exertions.

Mayor Rankin, of Elizabeth, reports from his city more than 2,000 men out of work. A number of large metal works and other factories have not been running for some time. The Charity Organization Society is providing food, fuel and clothing to about 550 families. The Mayor is treasurer of this society, and in that capacity has pushed the work of securing contributions of money and supplies. Thus far the supply has been equal to the demand, but it is feared that the demands during the next three months will grow much greater and that the supplies will be more difficult to secure. The society's superintendent is indefatigable, and he makes a personal investigation of each case. The Elizabeth system seems to have the advantage of being at once both simple and complete.

AT PHILADELPHIA.

Mr. Robert M. McWade, of the Philadelphia *Public Ledger*, sends further information concerning the work of the great permanent relief organization of which he is secretary. He says that at this moment there are about 50,000 unemployed in Philadelphia. There has been in some of the mills and factories a resumption of work on a limited scale, and at such reductions of wages as will enable the manufacturers to produce their goods and hold them in stock until the market shall become active enough to demand them. This has caused a reduction in the figures of the unemployed as given us a month ago by Mr. McWade. Efforts are being made on all sides to find some sort of work for the remainder. The executive committee is promptly meeting all cases of distress and destitution, and it was, when Mr. McWade wrote, on January 15, about to devise some important means for giving employment.

PITTSBURGH'S GENEROUS RELIEF SYSTEM.

In Pittsburgh at the end of December the work of relief received a great impetus from Mr. Andrew Carnegie's offer to pay to the relief fund an amount equal to its total receipts from all other sources up to the limit of \$5,000 a day for two months. The resumption of full work by all the Carnegie mills also further relieves the situation. Mr. Carnegie, in making this offer to the relief committee, dwells with great emphasis on the importance of providing work rather than alms; and as explained in our report last month, the Pittsburgh system is that of giving employment through the Department of Public Works upon municipal improvements to all the men whom the relief committee chooses to assign to Director Bigelow. The industries of Pittsburgh are of a kind which develop muscle, and it is not, therefore, a hardship for the majority of the unemployed in that city to do heavy outdoor work. The energy already shown by the relief committee, with the further stimulus and help given by Mr. Carnegie, has brought Pittsburgh conditions into a comparatively satisfactory state. The extent to which the co-operation of the relief committee and the municipality has drawn upon the ranks of the unemployed is illustrated by the fact that 4,000 men were at work under this arrangement in the Pittsburgh parks on Monday, January 15. On the following Saturday 1,000 men who had been working steadily for some time were discharged in order to make room for a like number who had not yet participated in the relief plan. On January 18 the relief fund had grown to approximately \$85,000, not counting Mr. Carnegie's contribution, which, of course, was of equal amount, and which is held in reserve to use as soon as the payments from the other citizens cease to equal the weekly requirement.

As compared with New York's plan of raising \$1,000,000 by the sale of city bonds to afford relief by public work, it is interesting to know that the Pittsburgh City Council has passed an ordinance providing for a loan of \$6,000,000, of which one-third each is to be used for (1) park, (2) street and (3) water improvements, with a view of giving work to many thousands of men at once. As we write, we have not learned of the Mayor's final ratification of the ordinance.

The neighboring city of Allegheny hopes to absorb all the unemployed men who belong properly to that place in the various public improvements which have been begun or definitely arranged for. Mayor Kendrick informs us that these new improvements include \$350,000 to be expended for sewers and a variety of work upon the existing streets, together with the opening of new streets.

CINCINNATI'S SUSTAINED EFFORTS.

The general method of relief organization in Cincinnati under the auspices of the Associated Charities was fully explained in our report last month. It is sufficient to add that a further report from Secretary Ayres, dated January 15, explains that the city appro-

priation of \$30,000 for employing men in the parks had become exhausted and that many laborers were out of work. The Associated Charities, to meet the most severe needs, had undertaken to cut down a hill and fill up a hollow, employing one hundred men at a dollar a day, with funds supplied by the citizens' committee. Another hundred men, mostly heads of families unable to do the heavy street work, were employed at the Labor Yard. The Evangelical Alliance had assumed charge of three hundred families, and had distributed them among the churches for complete care. The unemployed were showing a spirit of great patience and confidence in all who were trying to relieve them. Fortunately the regular contracts had been let for street improvements to begin in March, amounting to \$200,000, this being without reference to the unemployed. Meantime an effort is being made to secure further public appropriations, and while the situation is a trying one, its greatest needs are promptly met. It would be impossible to praise too highly the work of the Cincinnati Associated Charities.

THE CITIZENS' MOVEMENT IN COLUMBUS.

At Columbus, Ohio, a citizens' relief committee was formed about the beginning of November, as a result of a meeting of representative business men called by the Mayor. Its work was begun November 15. The original work of this committee was to dispense relief, chiefly in the form of orders for coal and groceries. For this purpose the city is divided into five districts, a reliable grocer in each district being appointed to fill orders. Applications are examined, and supplies dispensed in the most economical fashion, the applications of women being considered first in every case. Large donations of clothing and shoes have also been apportioned through this committee. Up to January 1 some forty-five hundred dollars had been paid out; and during the month of December fifteen hundred families were provided with groceries and more than eight hundred with coal. Some hundreds of garments were made by women employed at the Industrial Union, these women being paid by the hour and receiving grocery orders from the relief committee. No soup house has been provided and nothing has been done that could tempt the tramp element to come to Columbus. No family receives from the relief committee more than one ton of coal or two orders for groceries in a month, and a grocery order never exceeds two dollars. The city authorities have recently arranged to provide work in one of the parks for about five hundred men with families, and each man is to receive one dollar per day. For this information we are indebted to Mr. Amasa Pratt, who is superintendent and secretary of the Citizens' Relief Movement.

RELIEF IN TOLEDO.

As to relief plans in Cleveland, we have no definite information to add to our report of last month. But Mayor Guy G. Major, of Toledo, sends us information of a most satisfactory organization that has been effected there under a new Board of Associated Char-

ities. Up to the middle of January, the people had contributed a fund amounting to \$15,000, and in addition to this the Board of Park Commissioners had appropriated a like sum of \$15,000, to be paid out in wages to the unemployed. No one is employed until his case is thoroughly investigated, and no supplies are given to families until the investigator reports favorably upon them. Toledo for this purpose has been divided into sixty-two divisions, the voting precincts furnishing the dividing lines; and in each precinct the relief organization has a committee of three. All cases after the first investigation are turned over for further inquiry to the sub-committee that pertains to the precinct where the applicant lives. Supplies are procured upon the best possible basis from factories, mill owners and wholesalers. It is estimated by Mayor Major that thirty dollars will carry an ordinary family through the winter, supplying them with coal, lard, flour, potatoes, and a very little sugar and tea. Thoroughness and sound principles seem to be characteristic of the methods employed in Toledo.

INDIANAPOLIS AS THE MODEL INSTANCE.

The case of Indianapolis is one of very exceptional interest. All persons at all familiar with the methods of charity work in the United States, are aware that Indianapolis has for many years been in the forefront. If not the very best organized for charity work, the capital of Indiana is certainly one of the two or three best cities in America. This fortunate condition was due in large part to the ceaseless efforts of the late Rev. Oscar C. McCulloch. The necessity for exceptional measures this winter began to be realized in October, when the unemployed workmen in a series of meetings directed public attention to the necessity of a relief movement. An appeal was made to the Indianapolis Commercial Club to take charge of relief work. This business organization is composed of one thousand members, and has high prestige as the representative citizens' body of the town. The club referred the appeal of the workmen to a special committee composed of Messrs. H. H. Hanna, Eli Lilly and William Fortune. These gentlemen made a report which was fully indorsed by the Commercial Club, by the city authorities and by the unemployed workmen; and in consequence the three were appointed a permanent committee to take complete charge of relief work. The funds of the Charity Organization Society were placed at their disposal, and that society continued its work under their direction and as an instrument to give better efficiency to their plans.

The committee in its report had advised against out-and-out charity, or any method of relief work that would have a tendency to pauperize the recipients. It proposed a single organization with whose plans there should be no interference, and which should use strictly business methods. It did not begin by asking contributions, but opened a registration bureau and filed the applications of the unemployed

for work. With regard to every applicant there was ascertained full information as to his age, the number and age of those dependent upon him, the length of his residence in the city, his last employment and last wages, his income from pensions or otherwise, whether or not he was paying for a home through a building association, etc. The committee succeeded in securing work for about twenty per cent. of the applicants. Meanwhile, it had been quietly supplying food to those whom it was necessary to help in that way. Within six or seven weeks the number of dependent families had increased from less than two hundred to more than one thousand, or about four thousand persons. It was becoming apparent that even with the most careful investigation that could be made, there was much abuse of this distribution of food. It had been found impossible to secure any relief from the municipal authorities in the form of public work.

In the last week of December the committee gave up the plan of free distribution of food to the needy, and inaugurated the plan of selling food from the Central Market on credit to the worthy unemployed. This plan embraced two distinct departments of work; for the registration and employment bureau was attached to the food market, and was required to investigate each application for credit in order to determine the applicant's citizenship and his necessity. To each accepted applicant an account book is issued, showing the number of persons in his family, and certifying his credit for weekly rations for this number. At the same time he is compelled to sign an agreement to pay for the food when he is able, or to work on call of the committee for the payment due from him at the rate of twelve and one-half cents an hour.

The committee buys its supplies in large quantity at the cost price to wholesale dealers, and it sells them at the same price. There is no variation in the kind of food that is sold to applicants, all receiving the same combination of food, the quantity varying according to the number in the family. Sufficient is given to last for one week with frugal use, and patrons are not allowed to make more frequent purchases. The ration for a family of four or five persons for the first two weeks in January consists of twelve pounds of potatoes, ten pounds of corn meal, ten pounds of hominy, five pounds of fresh pork, two pounds of pickled pork, eight loaves of bread, one quart of molasses, one-half pound of salt and one cake of soap. The charge for this combination was eighty-two cents. At a retail store the cost in Indianapolis would be \$1.59. It is needless to say that in New York or any Eastern city the retail price to a poor family would be vastly greater than in Indianapolis. One-half of this quantity is issued to a family of two or three,—this being found sufficient for one week,—at a cost of forty-one cents.

The committee proposes to change the ration from time to time. It was expected, for instance, that the ration for the last half of January would consist of twelve pounds of potatoes, ten of corn meal, five of

hominy, eight of flour (or four loaves of bread), six loaves of bread, two pounds of pickled pork, four of fresh pork, one-half pound of lard, one quart of molasses, one-half pound of salt, one-half pound of coffee, one pound of sugar, one cake of soap. This ration, expected to last a good-sized family a week, was to be sold for one dollar. For a small family of two or three, the same articles, in one-half the quantity, would cost fifty cents. The committee also supplies three hundred pounds of coal per week at a charge of thirty cents. The purchaser transports the coal himself in wheelbarrows,—two tickets, entitling the holder to one hundred and fifty pounds, being issued each week. The supply of fuel is sufficient in ordinary weather for one cook stove. The committee also supplies shoes for the children of the unemployed, when the children are attending school and when the need of them is certified by the teacher.

It will thus be seen that the Indianapolis committee is relieving the necessity in that community at the lowest possible cost, and in a manner that is the least humiliating to the people who are receiving aid. No cash whatever is taken at this food market, for the supplies are sold only to those who are without money and cannot get credit elsewhere. It is expected, however, that in compliance with their contract the debtors will pay when the renewal of industrial activity opens employment for them, or else, what is more likely, that in most cases they will liquidate their indebtedness by such work as may be furnished them by the committee. It was hoped that arrangements could be made with the city authorities to enable these debtors to work out their claims on the streets and in public work; but the financial condition of Indianapolis thus far has not permitted it to raise any money for expenditure in that way. Finally, however, the committee has offered to furnish the labor without payment from the city, if the municipal authorities will furnish the necessary supervision and facilities for work. This proposition has been accepted, and the street commissioner is receiving each day as many men as he can employ. If any refuse to work, they are denied further credit at the food market. Most of the men, however, work out their accounts cheerfully. They are given one day's work at a time. This is sufficient to more than pay for a week's supply of food for a family of three. Besides cleaning and repairing streets, it is now proposed to employ the men to make a lake in one of the city parks. The originality and the scientific, as well as practical, character of the Indianapolis plan can hardly fail to be recognized by any intelligent person who reads this account of what, so far as we are aware, is the most perfect arrangement for relief that has been devised in any of our cities.

RELIEF MEASURES IN DETROIT.

Up to the holiday week no very exceptional or conspicuous efforts had been made in Detroit to relieve a condition of want that was beginning to assume serious proportions. The fact that no central citizens' committee had been formed, however, must be attributed

chiefly to the great efficiency of Detroit's official Poor Commission and to the very considerable funds at its disposition early in the season. Its annual appropriation of \$50,000, however, was rather quickly absorbed in the distribution of coal, wood, provision orders, etc. The number of families just before Christmas on the city poor books was 3,500, and on the county poor books 500 more; and ten thousand dollars per week at the beginning of the current year was necessary to meet the expenditures of the commission. Most of the applicants for relief had families of at least five persons, and the commission was expending an average of about eight dollars a month upon each family. The investigation of cases in Detroit is intrusted to the Police Department; and there is very cordial testimony to the efficiency with which the work is done. At the time our information was received it seemed to be generally understood that Detroit would enter at once upon the plan of giving a large amount of public employment to heads of families. Secretary Edward Dwyer, of the Poor Commission, reported that there were three thousand able-bodied men on the books, and that the number was increasing at the rate of 250 a day. Detroit is fortunate in having so efficient a Mayor as Mr. H. S. Pingree, and in possessing a generally well-ordered administration.

GRAND RAPIDS AND ITS ASSOCIATED CHARITIES.

One of the most important manufacturing towns in the West is Grand Rapids, Michigan. Last September it was estimated that out of 14,000 men regularly employed in the Grand Rapids factories, there were 6,000 entirely out of employment; and the 8,000 who were at work included many working on short time or at reduced pay. Mayor William J. Stuart now reports that the number of unemployed skilled workmen is considerably less, and will hardly reach 5,000. Fortunately, many of the unemployed have homes of their own, and enough saved to tide them over for several months. Early in the fall Mayor Stuart called together for counsel and advice a committee of representative citizens and members of the Board of Associated Charities, with an equal number of men representing the trades unions. But at every meeting of the committee it was unanimously decided that all was being done that seemed necessary through the agencies of the city and the Society of Associated Charities. The city government has undertaken extra street cleaning, employing men recommended by the Associated Charities, and has let many contracts for public improvements; but the greater part of the Grand Rapids relief work has been done through the direct agency of the Society of Associated Charities. The churches and various charitable and fraternal organizations are working in harmony with the society, and citizens have formed similar organizations called "Friendly Groups" in various parts of the city, to look up cases of want and to dispense relief, always working, however, in direct connection with the Associated Charities. The society has not only been very thorough

in its investigation into cases, but has used a great variety of ingenious methods for furnishing work in lieu of alms. One of Grand Rapids' wealthy citizens, Mr. Daniel H. Waters, has filled one of his vacant stores with all kinds of produce at an expense to himself of some thousands of dollars, and has turned it all over to be dispensed by the Charity Association. Thus the unemployed in Grand Rapids are perhaps as fully provided for as in any other city of the country.

From Saginaw, which has a population of some 60,000, the brief report received by us is of a hopeful character. On December 1 seventy-two per cent. of the usual number of employed men were out of work. Savings were being heavily drawn upon and the city's Overseer of the Poor was paying out larger sums for relief than ever before, while charitable institutions and churches were making extra exertions. But no general movement through a central relief organization had been deemed necessary.

A FURTHER REPORT FROM MILWAUKEE.

In Milwaukee a variety of relief agencies are actively at work, but the existence of a competent charity organization society seems to suffice fairly well to prevent duplication and overlapping, and the waste of resources upon fraudulent cases. Some large soup kitchens established by the Milwaukee ladies, which are feeding nearly a thousand persons a day, are the most conspicuous features of the emergency work now going on in Milwaukee. Free meal tickets are distributed through pastors and charitable societies. The Chief of Police is also active in relief work and has helped some hundreds of families, paying rent and buying fuel and supplies, always after strict investigation, with a fund placed in his hands by the rich brewers and others. The Jewish Aid Society is taking care of the needy of its own race, and the German Emigration Aid Society is active in its own field. By a memorable effort every known destitute family in the city was provided with a Christmas dinner. The labor unions are taking an active part in the relief of their own trades by assessing those of their members who have work. There is great increase of regular municipal aid as distributed by the Supervisors of the Poor in each ward. Through these and numerous other agencies the worst distress is mitigated in Milwaukee.

THE SITUATION IN WEST SUPERIOR.

West Superior, Wisconsin, one of the Western towns of phenomenal recent growth, reports several thousand persons unemployed. The city and county authorities have co-operated with the Associated Charities and with private citizens in dispensing aid, and very little extreme suffering has been permitted. A wood-yard has been opened at South Range, in the woods a few miles from the city, and additional employment is given to those who will work in that way. New park tracts have been cleared of "stumpage" by the city, and a large number of men at last accounts were employed in removing snow

from the streets. The public schools have co-operated actively in the work of relief. The Lend-a-Hand Mission of the King's Daughters has opened a cheap restaurant which co-operates with the central charity committee. Mayor Kennedy has proposed that the city should loan to the needy a small amount of money, to be paid back when prosperity comes again. Our report from West Superior is certainly a commendable one.

In Duluth, and in the new towns which have sprung up in the iron-mining district tributary to that port, the suspension of mining operations has thrown hosts of men out of employment, and has made necessary very large disbursements of clothing, fuel and food supplies. The relief has been afforded largely through the municipal and county board funds; but private agencies have also been as active as circumstances would permit. We are not in possession of detailed reports from those regions, but have reason to fear that the severity of the Northern Minnesota winter may yet occasion great suffering.

ST. PAUL AND MINNEAPOLIS.

From St. Paul there is little to add to our interesting report from Mr. Hamlin last month. About three hundred men have been kept in public employment and paid by private subscriptions collected through the central relief committee. It is expected that this number will be increased to five hundred men. The funds are paid into the city treasury and expended through the regular pay rolls of the Street Department. The various organizations have so systematized their work of relief and assistance, apart from the street employment scheme, that it is no longer a theme which fills newspapers or attracts great attention. The extraordinary demand has been met in such a matter of fact way by the central committee, with its thorough comprehension of the situation at the start, that the public generally hears little about it,—and this is as it should be.

Very early in the season, before the late harvests of North Dakota and Northern Minnesota had all been garnered, Mayor Eustis, of Minneapolis, observing the very large number of unemployed laborers who were gathering upon the street corners and threatening to become either a source of disorder or a public charge, quietly obtained from the Northern Pacific and Great Northern Railway companies a large number of free passes to use at his discretion. Within a few days he had shipped some seven hundred men to regions well northward where work was plenty and men were wanted. A very considerable proportion of those men have returned to Minneapolis, but they have brought some saved earnings back with them. A canvass made at Christmas time by the police force reported some nine hundred families in Minneapolis requiring aid. This census is confirmed by Mr. George A. Brackett, president of the Associated Charities. He informs us, however, that ninety per cent. of these families were already being cared for by the two main charitable agencies of Minneapolis—namely, the Associated Charities (a private or-

ganization composed of representatives of the numerous church and local benevolent agencies) and the municipal Board of Charities and Corrections. Both of these organizations, as Mr. Brackett declares, are sufficiently prompt in their action, and have ample means at their command to provide for all cases of destitution as soon as made known or reported. Private citizens are responding nobly with a liberality that is both cheering and practical, and, we may add, that is always characteristic of Minneapolis. It is not expected that any public employment measures upon a large scale will be justified by the necessities of the situation. The Associated Charities have one hundred and fifty ladies who as "Friendly Visitors" cover all parts of the city with their inquiries and ministrations. Including the city's Department of Charities, the work of the Associated Charities and its "Friendly Visitors," the church organizations and various ward relief movements, it is estimated that there may be two or three thousand families who are receiving more or less attention, but probably one thousand families in real destitution would be the figure agreed upon by those best informed. Just before Christmas Mayor Eustis and his secretary, Mr. Mannix, assisted by numerous citizens and leaders in charitable work, sent out to as many families some nine hundred or a thousand bushel baskets heavily laden with substantial supplies. It need not be explained that this Christmas gift was bestowed in the most discriminating way, and that it produced results fully as happy as had been expected. Two or three more such distributions of provisions are likely to be made before the long Minnesota winter is at an end.

WORK AND RELIEF IN IOWA.

The good people of Iowa are suffering from an extraordinary visitation of tramps, who are reported as having appeared in unprecedented numbers in the smaller towns and in the farming districts. But in the larger cities of Iowa the distress among resident and reputable working people on account of lack of employment seems not to be so great as in many other States. Our letter from Mayor Lane, of Des Moines, is to the effect that the number of persons unemployed and in distress is not very largely increased over other years, and it has not been deemed necessary to employ any special means of relief. The work is carried on by the various organized charities quite as in past years, except that these are now more united in their efforts and in closer agreement as to methods. Their burdens are reported as considerably increased, but not beyond their ability to afford the relief that is needed.

A less favorable report comes from Mr. Belfrage, of Sioux City, the Overseer of the Poor, who writes for Mayor Pierce. He says that the distress in Sioux City is one hundred and forty per cent. greater than a year ago at this time. He adds that the poor fund of the county is some \$25,000, but that the fund has been overdrawn already to that amount. The class applying for relief are almost exclusively of foreign

birth, many of whom Mr. Belfrage thinks were professional European beggars before landing on our shores. He makes the interesting parenthetical statement that not a Jew or a Scotchman has applied for assistance during the past year, and that American born citizens seldom apply for relief. The municipality has not been in a financial position to afford much extra work, but it is suggested that some measures have been proposed and may be adopted. Mr. Belfrage testifies very earnestly to the noble work that the philanthropic women of Sioux City are performing in their organized efforts to relieve distress, and he commends the churches of all denominations for a most creditable and well-directed activity in lines of work that supplement what the official relief funds which he administers are able to accomplish.

NOTES FROM LINCOLN AND DENVER.

Mayor A. H. Weir, of Lincoln, Nebraska, reports that the situation there has been practically met by the municipal policy of endeavoring to put to work all able-bodied men needing employment, at wages just sufficient to keep them from actual suffering.

"For," as he puts it, "men had better work for even fifty cents a day than earn nothing." He says further: "In caring for applicants for relief we direct all heads of departments as far as possible to put on two gangs or sets of men and work each gang half time, or three days per week. This affords employment to twice as many as if work were given for full time, and the half pay enables them to live without asking assistance." The city and county poor funds both afford temporary relief in cases of extreme need, and Lincoln has its quota of charity organizations working in their own ways. Thus no actual suffering has been permitted.

From Denver we have little to report in addition to the explicit statement given last month regarding measures which had proved equal to the severe emergency of the earlier part of the season. A great industrial recuperation in Colorado has already relieved the situation of its worst features.

TACOMA'S MUNICIPAL ACTIVITY.

Mayor Huson, of Tacoma, writes that the railroad shops, saw mills, and manufacturing industries of Tacoma have been employing about 7,000 men, and that the financial depression has thrown some 2,000 out of employment. At present it is estimated that in various ways this number has been reduced to about 1,200 men, the population of the city being about 55,000. A register of applicants kept by the Board of Public Works in the City Hall contains at present 1,100 names. During the autumn the hop-picking season, lasting about six weeks, furnished lucrative employment to every man, woman and child desiring it. Formerly much of this labor had been performed by Indians from Alaska, British Columbia and the Puget Sound region, but this year the white laborers secured the work, and in the prospect of a hard winter they fostered their means, so that up to the present time there has been no widespread distress. The city government, meanwhile, has done

what it could to provide labor. It has extended the sewer system, expending \$60,000 upon the work, and keeping 130 men employed, no one being put upon the pay roll except heads of families who had lived in the city at least six months; and no one was given work for more than two weeks in any one month. By this means the sewers gave some current income to nearly 300 families. The established wages of \$2 a day have been maintained by the city, although some private employers are paying only \$1.50. Tacoma has also just completed an important paving job, and the contractor followed in the main the regulations of the city government with respect to the selection of employees. The Municipal Council has now ordered an extension of water mains, and this work began on January 15, the labor being employed under the same conditions as those imposed in the sewer work. It was expected that the construction of a large bridge across an inlet from the Sound would be immediately ordered, and that this would absorb a large quantity of the idle labor. Moreover, an extensive field of employment will be afforded by the work of bringing in a new water supply, which is about to be undertaken, the money having been already raised by the sale of bonds. Upon the whole, it is evident that the enterprising city of Tacoma is not disposed to succumb in any way to the pressure of hard times.

SEATTLE ALSO MAKES A GOOD REPORT.

The city of Seattle may always be expected to push public works as actively as its neighbor and rival Tacoma. Thus Mayor Ronald, of Seattle, informs us that while his city, like most others, is encumbered with a surplus of unemployed labor, it is true that \$35,000 of sewer bonds have just been issued and sold, with the proceeds of which the city is now constructing extensive drainage works. It has aimed to employ every man that can be worked to advantage. The benefit of municipal wages is passed around by the plan of working one crew two weeks and then employing another composed of different men. As in Tacoma, none are employed who are not citizens and electors of the city, having families dependent upon them for support. Mayor Ronald further says: "The Bureau of Charities in this city, which is organized in accordance with the modern idea of such institutions, is performing a great work, not so much in the dispensing of alms as in cautious and conscientious investigation of all cases coming before it, or referred to it by the city officials. And the means adopted by the Bureau is efficiently weeding out chronic pauperism. The City Mission likewise does a grand work in this respect. The Salvation Army has been granted the privilege by the municipal authorities of maintaining a wood-yard upon certain property in the heart of the city. They have a graduated scale of work and are dispensing good and substantial meals to the hungry poor at five cents."

SAN FRANCISCO'S EFFECTIVE PLANS.

The disturbances of industrial conditions in the mining States of the far West naturally draw to the large towns and cities from the suspended mining

camps a large contingent of men out of work and hard to deal with. This was the situation that confronted Denver last summer, and San Francisco naturally received its share of the mobilized army of unemployed miners. The situation in the metropolis of the Pacific coast is concisely set forth in a letter from Mayor Ellert written as recently as January 11. The following extract contains the substance of the report: "The distress in our city at the present time, and for some months past, has been caused mainly by the influx of people from other States where the times were harder than they were here. In order to meet the requirements of the situation, a committee of citizens has been for several weeks past calling for subscriptions for a fund for the unemployed. Liberal response has been and is being made, and the money so collected is being used in making improvements in Golden Gate Park, thus giving work at nominal wages to several hundred men. There are at work there to-day in the neighborhood of 1,500 men. Soup houses had been established by public subscription, but the method was abolished as it became difficult to distinguish between the worthy and the unworthy. Efforts have been made all this time to provide some kind of work, and when such was obtained our own citizens and men of families have been given the preference."

PROGRESS IN BALTIMORE RELIEF WORK.

The Baltimore relief committee, organized as explained in our last number, has among other things established, in addition to the existing "Friendly Inn," a "Wayfarer's Lodge" in East Baltimore, which was opened about the middle of January, and which can accommodate 125 men. The increase of vagrancy in Baltimore has been so marked that the committee has considered it important as its first duty to make some provision for the absolutely homeless. The "Wayfarer's Lodge," in return for work only, chiefly in its wood-yard, gives relief in a temporary home. This and the already established "Friendly Inn" are working in co-operation with one another, and upon a good understanding with the police, their object being to discourage professional vagrancy and to encourage deserving men by giving them a chance to support themselves. The executive committee, having now provided for vagrants, has turned its attention to relief work for residents in need, especially heads of families. The city officials of Baltimore have taken no action except that the Park Board has started such winter work as it can do, so as to employ its regular hands. There are practical reasons which would make it difficult and costly to provide extensive street employment in Baltimore, and so the committee has decided to avail itself of the stone quarries on the city's borders and to employ men there in breaking stone. Two yards were opened about January 20. There is as yet no great emergency in Baltimore. In that latitude the winter is always mild, and this year it has been exceptionally so. We are indebted to Dr. Jeffrey Brackett of the central committee for information. It is pleasant

to note the fact that the committee has been so strongly reinforced not only by the names but by the active energy of the Johns Hopkins professors.

REPORTS FROM SEVERAL SOUTHERN CITIES.

Mayor Ellyson, of Richmond, Va., informs us that there are in that city more than 1,200 families who are receiving aid from the public charities. A public meeting was recently called by the Mayor at which a citizens' committee was organized to secure money to furnish supplies for the relief of the destitute. When Mr. Ellyson wrote, there was pending before the City Council a proposition for appropriation of money for work on the public park in order to give some outlet to the congestion of unemployed labor. The Richmond charity organizations were never more active, and Mayor Ellyson assures us that there is every reason to believe that the efforts now made will result in relieving the severity of the distress which was at first prevailing.

Augusta, Ga., like Augusta, Maine, happily reports no workmen out of employment. The cotton mills have been operated without interruption, and have all paid dividends. There have been no commercial failures of any note, and while there is by no means a high degree of business activity or prosperity, there is on the other hand no especial or extraordinary depression.

From the city government of Savannah we have received a similar report. No unusual degree of destitution has been observed, and the city has not been affected in any marked way by the industrial conditions prevailing throughout most portions of the country. Even if conditions of employment were much less favorable than usual, the mild climate of the South would in any case mitigate the hardships of poverty.

New Orleans is another of the Southern cities which is able to report that no special relief measures are needed. Mayor Fitzpatrick informs us that no organized movement has been made in New Orleans, and he adds that his section of the country is not suffering to any such extent as other sections, for which he assigns the reason that the excellent sugar crop of last year has made a good demand for labor.

Dallas, Texas, has not been so fortunate as the Southern cities on the seaboard. It reports much distress among the unemployed persons in the city, these being estimated at 1,000 by Mr. Reynolds, secretary of the central charity organization. The situation has been the means of consolidating all charity workers. Among other methods employed are a soup kitchen and a wood-yard. It is expected to begin the city's usual improvements earlier than is commonly the case, in order to make use of furnishing aid. The people for whom all these preparations have had to be made are those who have recently flocked to Dallas from other States.

KANSAS CITY'S STATUS.

An interesting report comes to us from Mayor Cowherd, of Kansas City, who explains that there has been less distress on account of lack of employ-

ment in his city than in other Western places, owing to the fact that manufacturing is not largely developed except in lines such as packing houses. These have been running regularly and employing far more men than usual. Moreover, Kansas City is dependent for its trade in large measure upon the agricultural country of the Southwest, which has had fairly good crops and is hardly worse off than usual. But there has been a large influx from the mining States further west and north, and it has been necessary to make some provision for these transients. A large room in the City Hall, known as the Drill Room, is used as a sleeping quarter for such unemployed persons as may have no other shelter. At the time of the Mayor's letter some 200 men were sleeping there every night. The Provident Association is the principal central agency for dispensing charity in Kansas City, and it has thus far secured by voluntary contributions to date \$15,000, to which the city has added two or three thousand. This association employs many women in repairing clothing, which it collects in large quantities. It also maintains a wood-yard and stone quarry. At the quarry about 150 men are employed at present, these being paid according to the amount of stone they break. The broken rock is purchased by the city and by contractors, and used in street paving. An unusually mild winter is reported; and the city is endeavoring to open a large amount of public work, especially street grading and sewer building, in order to give employment to as many as possible. The work of the Provident Association seems to be of a very comprehensive character and to include a thorough investigation of cases.

ST. LOUIS'S RELIEF ARRANGEMENTS.

The following very complete statement of the progress that has been made since last month in improving the methods of relief work in St. Louis is prepared for us by Mayor Walbridge's secretary, Mr. William F. Saunders:

The past thirty days have so perfected the machinery of relief for the poor in this city that it is now generally felt that the situation is entirely in hand. The weather has been very mild and the distress among the unemployed, of course, much less than it would have been had the winter been a severe one.

Most of the plans for helping the poor are now directed to the object of collecting money and turning it over to the three principal benevolent organizations of the city, whose systems enable them to relieve real suffering with the smallest possible percentage of waste on the undeserving. Quite a number of successful entertainments for this purpose have been given during the past month, the money obtained being divided among the three organizations in proportion to the amount of work known to be done by them generally. The best paying of these entertainments, an athletic one conducted by the *Star Sayings* newspaper, netted several thousand dollars.

For the rest of the winter the man willing to do manual labor will not suffer. He will be provided for in sev-

eral ways. Mayor Walbridge has directed the Superintendent of Streets to employ the gangs of laborers in such a way as to divide the work in each district among the unemployed men of each district. Since this instruction was issued there has been a sensible diminution in the number of applications for labor made to the Mayor directly, although the appeals for charity from men and families entirely helpless remain about the same. In this office we have to help most the people dependent upon clerks and bookkeepers and other men without trade, profession or muscle. A great wood yard managed by the Provident Association, one of the three organizations spoken of before, and supported by the patronage of the charitable gives work to many, who are fed and paid for their labor. The Municipal Assembly has adopted a suggestion of the *Post Dispatch* and is holding daily meetings to pass a bill by which life is to be given to a long-standing contract of the Lindell Street Railway with the city, and \$25,000 is to be secured immediately for the extension of a large lake in Forest Park and the employment of several hundred men in digging it. By the time this is published the work will be going on under the direction of a citizens' committee, which will hire the men and disburse the money.

Several soup houses are still being maintained in the city by numerous small subscriptions from individuals, and many cheap restaurants sell meal tickets to the retail stores at reduced rates, the shop keepers giving these tickets instead of money to men who apply for aid to them. Although this is probably one of the least satisfactory forms of giving, yet it is decidedly better than giving money indiscriminately.

The Saturday and Sunday Hospital Aid Association has been organized lately and its first collection, a very generous one, was taken up this month through boxes placed in many public places throughout the city on Saturday, and collections in all the churches on Sunday. This association is modeled on the London plan, where £60,000 was obtained in this way last year. The association here has on its committees representatives of all religious denominations. Chancellor W. S. Chaplin, of Washington University, is one of its most active workers and was one of its originators here. The committee which receives the money and divides it among the hospitals in proportion to their merit, is composed of the Mayor, the Postmaster and the president of the Merchants' Exchange. This association is intended to concentrate the efforts of benevolent people especially interested in hospital work and relieve them from the task of discriminating between institutions all more or less meritorious, among which the giver has probably no choice.

The *résumé* thus given of charity work and relief organization, while not inclusive of some of the important centres of work and inhabitancy, is complete enough to be representative. It will convey a very good general idea of the nature and extent of the distress existing in the different parts of the country, and of the machinery that has been devised to mitigate the suffering of the unfortunate victims of the prevailing industrial depression. Upon the whole, the facts seem to us to do great credit to our cities, both to their municipal authorities and also to their citizens.

LEADING ARTICLES OF THE MONTH.

SOCIAL AND ECONOMIC LEGISLATION OF THE STATES IN 1893.

IN the *Quarterly Journal of Economics*, Mr. William B. Shaw reviews the social and economic legislation of the different States in 1893. We summarize as follows the most important State laws that have been enacted during this period: In Indiana and Kansas laws are now in force requiring the weekly payment of wages by corporations, Indiana requiring this of mining and manufacturing companies only, and Kansas excepting all railway, farm and dairy corporations. The coal miners of Kansas have secured the passage of a law prohibiting the screening of coal before weighing, where the wage payment is based on the quantity of coal mined. A new factory law in Illinois restricts the labor of women to eight hours a day or forty-eight hours a week, and prescribes that the number of required hours must be kept posted in every factory where women are employed. Another provision of this law enacts that no children under fourteen shall be employed in any kind of manufactory. California passed a "rest day" law requiring the setting apart of one day in seven for rest from all labor, but not specifying any particular day. This is in no sense a "Sunday law," and was not designed to secure religious observance, but solely to limit the week's work to six days. In New Hampshire a State labor bureau has just been organized, and in Ohio a State board of arbitration has been created similar in all respects to the boards in New York and New Jersey. Decisions by these boards are not binding on the parties to the controversy. As a measure of protection to the labor unions it is made a misdemeanor on the part of employers in California, Idaho, Indiana and Missouri to discharge their employees for joining such unions or to cause employees to enter into contracts not to join them as a condition of employment.

CORPORATION AND RAILWAY LEGISLATION.

The new "anti-trust" law of Illinois is intended to reach all corporations whose business partakes in the slightest degree of the nature of a combination to restrict competition or fix prices, with the single exception of firms dealing with farm products at first hand, and purchasers are released from liability for purchase money when goods are bought of a "trust." Every corporation in the State is required to report annually whether any business is held in or business done with a "trust" of any kind.

"In South Carolina and South Dakota railroad commissioners are hereafter to be elected by the people. Nebraska and Washington have obtained maximum freight rate laws, which would have been placed on the statute books two years earlier but for the interposition of the Governor's veto. The railroads are given virtually their own rates on most kinds of

freight, but increase of these is prohibited. North Dakota fixes maximum freight rates on coal mined in the States. Railroad 'wrecking' is made a felony in Georgia. This offense, on the part of corporation officers and stockholders, consists in any form of plotting for the depreciation of stock in market value.

"During the year three States have attempted to regulate traffic in railroad passenger tickets by legislation. In Minnesota and North Dakota all ticket agents must be authorized and licensed by the State government. Unused tickets are to be redeemed by the companies. The Texas ticket law seems to have resulted in failure already. It required merely that agents should have certificates from the companies. It is now charged that some of the companies have furnished brokers with their certificates, to the discomfiture of rival lines.

COUNTRY ROAD LEGISLATION.

"Attempts to enact and put in force more radical road legislation in the different States are becoming more frequent from year to year. In Massachusetts a State commission is charged with the collection of statistics concerning highways and the construction of a State system. Idaho is another State which has undertaken to build State roads, providing for their cost by the issue of bonds. In Oregon and Washington highways are maintained by the counties. Missouri has adopted a so-called 'local option' county road law, under which the county courts appoint the supervisors. New York also permits the supervisors of any county to adopt the county system if they see fit to do so. A county engineer is to be appointed in such a case. Indiana makes it binding on county officers to accept and keep in repair every mile of gravel road built by private enterprise. Owners of wagons with broad tires are to receive credit in New York and New Jersey on their road taxes. Oregon divides her share of the United States 'direct tax' refund pro rata among the counties according to area, to be used for roads and bridges.

CHANGES IN THE TAX SYSTEMS.

"The principal changes in the tax systems of the different States made during the year had to do with methods of assessing and taxing corporations and estates. Texas has provided for an annual franchise tax of ten dollars on each corporation. Alabama imposes State license fees on all corporations, doubling those to be paid by companies applying to the legislature for special charters. It is made one of the duties of the railroad commissioners in North Carolina to assess all the railroads in the State. In Alabama sleeping car companies are required to pay an annual privilege tax of five hundred dollars and one dollar for each mile of road on which the cars are operated in the State. The Territory of New Mexico requires sleeping and palace car companies to pay two and one-half per cent. on gross earnings, the proceeds of the

tax to be divided equally between the Territorial government and the counties through which the cars run. Texas imposes a State tax of one-fourth of one per cent. on the capital stock of such companies employed in the State."

Three States have enacted "collateral inheritance" tax laws during the year. California takes five per cent. of the value of all estates valued at more than \$500, the proceeds to go to the State's school fund. In Maine the rate is fixed at two and one-half per cent. In Ohio, all estates of less than \$10,000 are exempted, and the tax on all of greater value is three and one-half per cent. In Minnesota a constitutional amendment authorizing the taxation of inheritances is to be submitted to the people next year.

THE ECONOMIC HISTORY OF THE YEAR 1893.

QUITE appropriately the *Forum* for January presents as its financial article a review of the economic history of the United States during the year 1893. The writer, the well-known student of economics, Mr. David A. Wells, by way of introduction briefly sums up the experiences of the last twelve months by saying that "probably no other country has ever incurred in so short a time such an amount of industrial and financial disturbance and disaster, the effect of which, expressed in terms of money-loss, aggregates hundreds of millions of dollars."

BUSINESS FAILURES.

How almost appalling have been the losses caused by the recent financial panic is suggested by the following statements and statistics which we take from Mr. Wells' article. Between May 4 and October 3 deposits to the amount of \$378,000,000—\$299,000,000 by individuals and \$79,000,000 by banks and bankers—were withdrawn from the national banks alone, and if to this sum the withdrawals which occurred in like proportion from savings banks, private banks and trust companies be added, the aggregate would undoubtedly exceed \$500,000,000. To meet this drain the national banks were obliged to call in loans amounting to \$318,000,000 and the other banking institutions in this country pursued a similar policy. "This concurrent action," says Mr. Wells, "is the most remarkable feature of the recent remarkable economic experience under discussion. It probably finds no exact parallel in economic history. It greatly intensified adverse influences which before operated gradually; paralyzed the whole industrial system of the country by annihilating for the time being a great deal of its machinery of exchange, and making commercial credit well nigh impossible; and entailed losses of such magnitude that long years in the case of any other nation would have been necessary to effect even moderate recuperation. Between January 1 and October 31, 585 bank institutions suspended payment, with liabilities of \$169,000,000. Of these banks, the suspension of only 171 was temporary. During this same period over one billion, two hundred million dollars' worth of the railroad property of the country was placed in the hands of receivers." Mr. Wells es-

timates that the total number of failures for the year of 1893 will be found to have exceeded 16,000, as compared with 12,000 in 1892, the largest number ever before reported in one year, and that the aggregate of these contingent liabilities probably exceeded \$460,000,000, as compared with a maximum of about \$200,000,000 in any one year since 1857.

INDUSTRIAL STAGNATION.

Another most remarkable feature of the situation, as pointed out by Mr. Wells, was the extreme stagnation to trade and the loss contingent upon the same. "Rarely if ever before were so small stocks of almost every commodity which the American people have regarded as the essentials of good living carried by the smaller distributors, whose policy can be ascribed to a prompt recognition of the fact that these same people had suddenly and as if by preconcert ceased to purchase and consume at the rate they had been maintaining for many years, and that by the withdrawal of their funds from banks and other financial institutions all trade and credit was being subjected to great restrictions." It is given as the opinion of experts, for instance, that the consumption of sugar by the country decreased during the months of July and August 33 $\frac{1}{3}$ per cent. There was even a large decrease in the use of smoking and chewing tobacco, as evidenced by the fact that the internal revenue from these articles fell off in the three months, July-September nearly \$1,100,000.

"Finally, in order to make this summary complete there must be added the losses incurred by the owners of shops and factories who were obliged to suspend operations, and above all by the thousands of men and women, representing every form and grade of labor, who, by reason of widespread limitations of their usual opportunities for employment, were unable for considerable periods to earn wages. To state specifically in terms of money how great those losses have been in the aggregate, is not possible; but few who have made the matter a subject of investigation will doubt that a *thousand millions of dollars*, or more than one-third of the amount of the national debt at the close of the war, would be an under rather than an over estimate. But, be this as it may, it is at least certain that the aggregate of these losses, by whatever method measured or expressed, was very great; and, further, that their burden fell most grievously and disproportionately upon that portion of the population of the United States which was least able to bear it—namely, those who depend upon each day's earnings to meet each day's needs."

THE CAUSES PURELY LOCAL.

Mr. Wells then goes on to show that the disastrous economic experiences of the United States during the past year as respecting their origin and characteristic features were purely local, the immediate and principal cause being "a distrust of the very foundation upon which the whole country rests—namely, its currency."

He reminds us that in the Dominion of Canada there has been no panic, no unusual demand for

money, no stoppage of industries, no restriction upon trade nor any increased rate of interest, and that in Mexico the credit of the country was never higher than during the last year, nor its general industrial condition more promising. Even in the Argentine Republic trade during the past twelve months has been rapidly reviving and private credits have been largely sustained. He points out, furthermore, that while money at all the financial centres of the United States has commanded for months the highest rate of interest, and at times was almost unobtainable under any conditions, in the markets of England "money has gone a-begging for use at from two and one-half to three per cent. interest."

The cause was not only a purely local one, but, continues Mr. Wells, "it is also equally capable of demonstration that the cause of this same disturbance was mainly artificial and wholly unnecessary and unnatural; namely, as before pointed out, a distrust, on the part of the people of the United States, of the future of the money of their country, which distrust in turn was created by an artificial, unnecessary and unnatural national fiscal policy. This proposition finds curious illustration and proof in the fact that the large withdrawals of deposits in banks, before noticed, did not seem to have been influenced or occasioned by a suspicion of unsoundness or mismanagement on the part of the banks; but rather by an almost universal sentiment on the part of depositors that it was expedient for them to get their money as quickly as possible into gold or its representative, and then bring it more under their individual control by placing it in safe-deposit vaults, or in other secure hiding-places."

TEACH THE POPULACE POLITICAL ECONOMY.

The remedy for our present economic situation Mr. Wells finds "only in better popular education, obtained either through the slow school of experience, at which the nation, paying exorbitantly high tuition, has long been in attendance; or through the institution, by the agency of the presidents and professors in our colleges and the teachers in our higher schools, of more intelligent and less expensive educational methods. In other words, instruction in the fundamental and generally accepted principles of political economy should be advanced to a higher position than it now holds in our educational system; and their study, regarded as an essential for good citizenship, should be made imperative (attractive also, as it can be) on all students above a certain age and of fair mental capacity." He holds that no theological seminary is efficiently equipped unless it has among its instructors a person capable of teaching political economy.

Mr. Wells' definition of political economy will be interesting to many. He considers it to be not "the science of wealth," or "the science of exchanges," but rather "the history of the world's experience in endeavoring to better its material condition, and the making of correct deductions from such experience, with a view to present and future guidance in furtherance of the same purpose."

THE WILSON TARIFF BILL.

IN the *Forum*, Representative William L. Wilson explains the principles and methods of the new tariff bill which bears his name. He interprets the result of the presidential campaign of 1892 as meaning that the party in power is instructed to repeal the McKinley act and to reverse the principles in which all the tariff laws of the previous thirty years had been framed; and the new bill, he tells us, is the first step toward the fulfillment of this instruction.

Speaking for the members of the Ways and Means Committee who helped to form the bill, Mr. Wilson says that "they are unflinching believers in the simple truth that all taxes exacted from the taxpayer should be for public purposes alone, and that they accept with equal heartiness the correlative truth laid down in the oft-quoted decision of the Supreme Court that to lay with one hand the power of the government on the property of the citizens, and with the other to bestow it upon favored individuals, to aid private enterprises and to build up private fortunes, is none the less a robbery because it is done under the form of law and is called taxation. When the law compels me to contribute my just quota to the support of government it is taxation; when it compels me to contribute to the support of any private enterprise it is robbery. The first is a tariff for revenue; the second is a tariff for protection."

A MAKE-SHIFT.

Mr. Wilson does not pretend that the authors of the new bill have carried out to the letter the instructions of the majority of the voters at the last Presidential election, but asserts that they have aimed to make as near an approach as possible to these instructions; have reduced the tariff as much as was safe or expedient at the present time. He says: "No men will more frankly and readily admit that they have halted some distance on this side of the goal, and that they have not been able to purge our tariff system as thoroughly of its protective taint as they themselves expected even when they entered upon their task. Their defense is that they believe too strongly in the political and economic blessings of thorough revenue reform to imperil its permanent success by going further than they have gone in their first march. It is a great triumph to be able to move at all in the right direction. Responsibility for action is always a sobering influence. They have had to deal with an inveterate and vicious system that had stealthily and resistlessly fastened itself upon every branch and ramification of American industry, and to which trade and production for years had imperceptibly if inconveniently adapted itself. The 'obduracy of fixed habit,' no less than the irrational, but none the less real, dread of all change, were to be reckoned with. 'A legislator must do what he can when he cannot do what he would.' Stable freedom has come only to that great race that has known how to reform without destroying."

"The really great and beneficent reform of the bill is," says Mr. Wilson, "the release from taxation of

the great basic materials of modern industry," and the next important feature is "the general substitution of ad valorem duties for the specific duties of the existing law."

Mr. Gunton's Opinion of the Bill.

Mr. George Gunton, writing in the January number of his *Social Economist*, criticises severely the Wilson bill:

"1. From the point of view of general principles, the new bill is a complete failure. It is consistently neither a protective measure nor a revenue measure. It continues discriminating duties on imports but fails to give protection to home industries. It levies duties on non-competing products but fails to furnish adequate revenue for the government. The only semblance of principle in the bill appears in the subordination of industrial interests to political ends.

"2. It cannot possibly lessen the burden of taxation, since there is already a deficiency of seventy millions in the national revenues. Any reduction of taxes it makes on imports will involve an increased tax upon domestic products, and to the extent that it reduces the duties now paid by foreigners it must increase those paid by Americans. Besides increasing the general burden nearly a hundred millions, in order to cover the existing deficit it will by its free list transfer to American consumers nearly a hundred millions of duties that have heretofore been paid by foreign producers. Thus, instead of lessening the burden of taxation, it will greatly increase it.

"3. Nor will it tend to secure greater honesty and simplicity in the collection of taxes. On the contrary, all the changes of method it introduces are in the opposite direction. In substituting ad valorem for specific duties, it increases the most fraud producing element in all tariff taxation. It has always been a criticism on the custom house system of revenue collection that it furnishes great inducements to fraud and corruption in public service by making misrepresentation profitable.

"4. Since the object of the bill is to increase the revenue by larger importations, it cannot promote the industrial development of the country. It is too obvious to need arguing that unless there is a definite increase in the aggregate consumption increased importation must be accompanied by decreased home production. Now, there is nothing whatever in this bill that can even remotely increase domestic consumption. Displacement of domestic manufactures in our home market by foreign necessarily means the suspension to that extent of home industries and the discharge of home laborers, all of which in turn means the reduction of home consumption. Of the truth of this every manufacturing town in the country is an appalling illustration. Instead, therefore, of developing our national industries its effect will be to destroy many of them by the process of displacing home by foreign products."

Mr. Gunton says further: "Judged from the point of view of its economic influence upon society, the new tariff bill has not a single leg to stand upon.

It conforms to no accepted or projected economic principle. As we have seen, its influence will be to increase taxation, encourage dishonesty in business and the public service, check industrial development, depress wages, and lower the standard of living among the people. Moreover, the conviction that these will be the consequences of the bill is daily gaining acceptance everywhere outside of Administration circles.

"There has not been a question before the American people during the last quarter of a century in which the wage-workers had such a direct and deep interest as in the defeat of this bill. The disruption of industries and the consequent collapse of labor organizations is more important to wage-earners than any mere change of prices that could possibly result from this measure, even if it would accomplish twice as much in that direction as its most ardent advocates pretend. Every labor organization throughout the country should use its entire influence through monster meetings, petitions, municipal governments, State legislatures, Congressmen, philanthropic organizations and every other social avenue, to bombard Congress with public sentiment so fierce and unrelenting that it will not dare to make the Wilson bill a law."

THE INCOME TAX.

IN the *Annals of the American Academy* there is a timely article by Mr. Frederic C. Howe, who discusses the income tax as a source of federal revenue. Reviewing the workings of the tax of 1861 he finds that while it was unpopular and difficult to administer successfully, nevertheless, from a purely fiscal point of view, it proved most satisfactory. We are told that in 1865 it produced as much as was received from spirits, both malt and distilled, and tobacco, while in the year following it returned nearly forty per cent. more than these combined resources. In 1864 nearly fifteen per cent. of the receipts were derived from the income tax, in 1866 over twenty per cent. and in 1867 over twenty-four and one-half per cent.

But, on the whole, Mr. Howe is of opinion that the income tax should be employed only as a last resort, and doubts the advisability of the federal power ever imposing such a tax in times of peace. "Few taxes were more unpopular or odious to the people than the income tax. From its first imposition it was assailed as invading the sanctity of the most private affairs, as being inseparable from inquisitorial scrutiny into business relations, and an insufferable penetration into those affairs of the individual which were in a sense sacred, and which in the past had been exempted from the visits of the excise man. It was further alleged, with some truth, that a tax which offered such opportunities for evasion was a charge upon honesty and a premium upon false returns. In the large cities especially was the tax exposed to widespread evasion and fraud. In the hands of an honest and conscientious official the mode of assessment was vexatious in the extreme, while in the

hands of an incompetent one it was open to all sorts of collusion. In the former case it was grievous, annoying and unpopular; in the latter unjust, tempting to evasion and falsehood and destructive of the moral sense of the people, who came to view the oath lightly and to look with equanimity upon any attempt to defraud the revenue."

Mr. Howe does not think it necessary to impose a tax upon incomes for the purpose of meeting the contemplated deficiency in the revenue for the coming year. A deficiency to the extent of nearly one hundred million dollars could be met, he suggests, by increasing the tax on distilled and fermented spirits and tobacco. The receipt from these sources for the year 1893 was \$159,000,000. He estimates that \$250,000,000 could be derived therefrom without material loss in the quantity consumed.

An Income Tax on Corporations.

In the *North American Review*, Hon. William L. Wilson, Chairman of the Committee on Ways and Means, presents in a favorable light the income tax without, however, giving it his unqualified indorsement as a means of covering the growing deficit in our national revenues. Mr. Wilson regards the theory of the income tax a just one, but recognizes that its administration is necessarily accompanied by exasperating and demoralizing incidents, and that in a country of the large geographical dimensions of the United States it would be very difficult to put into smooth working order the necessary machinery for its thorough collection. He does not, however, consider that the income tax has had a fair trial in this country, that of 1861-1875 having been levied "too short a time and been too often changed to become a familiar and workable part of our fiscal system." Moreover, considering that the repeal of this tax was carried by a very narrow margin in both houses it could not have been especially unpopular. Senator Sherman was among those stoutly opposing the repeal, and in a speech made in the Senate May 18, 1870, he declared it the most just and equitable tax that is now running in the United States of America, without exception. Other prominent Republican representatives also gave it their indorsement.

In Mr. Wilson's judgment the income tax is not liable to the charge that it is class legislation. He does not in this article favor taxing the income of individuals, but would limit such a tax "to that class of our citizens who own and control a very large and increasing amount of the property of the country, who enjoy certain public franchises of a very substantial character, and who, therefore, have no right to object to some public scrutiny of their incomes." In other words, a tax upon the incomes or earnings of corporations. Such a tax, he holds, would produce a revenue sufficient to cover a large part of the gap now open between receipts and expenditures, and would not be a tax upon individual thrift, energy, or enterprise. "It would in the main fall upon the earnings of invested capital."

AN ATTACK UPON THE ADMINISTRATION'S BUSINESS POLICY.

IN his usual vigorous and trenchant manner ex-Speaker Reed deals, in the *North American Review*, with the subject, "Tariff and Business." He thus enters upon his attack against the policy of the present administration: "When at last the Sherman act was repealed and the cause of our condition, according to all standard Democratic newspapers, was removed, there were, owing to the delay caused by the party in power, few people left to rejoice in the success which had been so much heralded only a few months before. Even prior to the repeal, the conviction began quietly to steal over the people that the true cause of the stagnation in business, the true source of all our troubles, was the fact that in power and supreme control over the United States was a party which, however meritorious its individuals might be, as a party was utterly incapable of inventing a policy or even of carrying out a policy which has been boldly promised and broadly announced."

THE WILSON BILL.

His views on the Wilson tariff bill are given in the following paragraphs: "Now that the bill is before us, what is to be said of it? Clearly it is not a bill for revenue only, since it reduces the revenue of the country probably seventy-five millions of dollars, so far as the usual treasury calculations can furnish us any aid in determining what the loss will be. If there be any gain to be anticipated to be set off against this loss it must come from increased importations, which will just so much diminish American production and be so much taken away from American labor. The bill cannot claim the merit, if there be any, of free trade, except such as comes to it from having selected and cut off from protection many industries which were at least as deserving as those which are to survive. In its struggle to put raw materials on the free list, this bill, devised in the main by Southern men, has so stricken the undeveloped regions of this country that the South is more likely than any other part of us to pre-eminently suffer by their efforts. The time was when the West felt toward protection much as the South does now, but with Illinois as the third manufacturing State in the Union, the West beyond the Mississippi is looking forward to the day when the more direct benefits may reach them and develop their resources also. In like manner the wise business men of the South are looking forward to-day, or rather were looking forward last year.

NOT A FULFILLMENT OF THE PARTY PLATFORM.

"The bill cannot claim any merit as a fulfillment of the platform of the Democratic party since that platform denounced protection as robbery, and if protection be robbery, then this bill is robbery on a sliding scale.

"If the bill cannot claim that it carries out the principle of free trade, and cannot, by the wildest stretch of imagination, be deemed the fulfillment of solemn

pledges of the party in power, what is its merit? It cannot be that the men who made it will claim for it the advantages of protection. They could not do it. Too long have they reiterated the charge that 'protection is robbery, depriving people of their property under pretense of taxation.' 'Can taxation create anything?' they have been asking triumphantly in chorus for long years. If taxation cannot create anything, what are they trying to save by their sanction of reduced robbery? If the consumer has to pay the tax to the manufacturer equal to that added by the tariff to the price of imported goods, what difference is there in principle between that taxation which puts an unjust dollar into the pockets of the robber barons and that same kind of taxation when it puts an unjust half a dollar into the same pocket to jingle against the dollars of bygone days? Has the United States reached that point of national decrepitude when it must ransom itself by a surrender of one-half of an unjustifiable exaction?

"This bill has all the forms of a protection bill. It tries to adjust the duties to the nature of the production and to discriminate between different stages of manufacture. It surrenders all principle in form, but is likely to be as deadly as could be desired in practice."

HOW TO PREVENT A MONEY FAMINE.

"HOW to Prevent a Money Famine" is the subject discussed by Hon. James H. Eckels, Comptroller of the Currency, in the *North American Review*. He says:

"The question to which the friends of a sound money system should now address themselves is not how to temporarily defeat the desires of the Populists, the advocates of free coinage of silver, of government warehouses, and kindred plans, but how to permanently insure the country against the dangers which would flow from the crystallizing into law of their monetary and financial sophisms. Such result cannot be brought about by either scoffing at their leaders or scouting that which they propose. Neither will it do to underestimate the sources of strength of those who range themselves under the banner of the Populist and free-coinage parties. So long as they have the enthusiasm which springs from the belief of lessening the woes of the debt-burdened classes to urge them to effort, and the encouragement of the timorous and compromising in the ranks of those who oppose them, they will continue an active force in monetary agitation and an uncertain element in American politics, and, as such, warrant recognition and intelligent opposition.

NEEDED: A CAMPAIGN OF EDUCATION.

"That which now is most needed is a campaign of education on monetary and financial questions. The education to be given ought to be systematic and thorough. It ought not to embrace either abstruse theories or illusive deductions. The freer it is of technicalities the more complete will it be and the results accomplished more certain. It should be rid

of all ambiguity and devoid of that enigmatical mystery which so long has cloaked the utterances of many of our skilled practical financiers only to create 'confusion worse confounded' in the minds of the public on the operation of finance and the workings of our currency system."

Mr. Eckels lays down as follows the campaign upon which financial education ought to be conducted: "First, the American people must know that the essential requisite of our currency is not volume but soundness; and, second, they must cease looking to Congress in every season of financial distress for relief, but instead become more self-reliant, more self-helpful and learn to employ to a greater extent the means locally at hand."

CREDIT VERSUS CURRENCY.

"No matter how great or how small the volume," says Mr. Eckels, "there will always be sections of the country where, under the same conditions, money famine will prevail. Legislation is powerless to remedy this or to put an end to it, and the sooner this fact is realized, the sooner will the people of this section set about to create conditions which will bring to them at any and all seasons of the year such amounts of money as will best meet their needs." He quotes Gallatin's famous saying that "the man who says that he wants money could at all times obtain it if he had either credit or salable commodities," and adds that it is the failure to appreciate that it is want of credit on the part of the borrower and not a want of currency in the country which causes an appeal to Congress to do that through legislation which can only be accomplished through individual or local exertion.

In conclusion, Mr. Eckels says: "When the American people call into use, to the extent that the best business methods require, the aid which good banks can afford, Congress will be relieved from the recurring importunity to increase the volume of the circulating medium irrespective of its stability, the cry for more money will cease, each community will, in the greatest measure, contribute to relieving its own distresses, and the financial vagaries of inflationists no longer continue to plague our world of business and of politics."

GOVERNOR WAITE'S PROPOSAL.

IN the *North American Review*, Governor Waite of Colorado declares that the financial policy of the government since 1883, culminating in the repeal of the Sherman act, has deprived his State of about \$24,000,000 per annum. He comes forth with a proposal for remedying this loss to the business of the State caused by the closing of the silver mines. This proposal is that the State should enact that the silver dollar of the United States and of our sister republics in North and South America, containing not less than 371¼ grains fine silver, shall be a legal tender by tale, or at one hundred cents each, for all its private and public debts collectable within the State. "As a matter of constitutional law," says Governor Waite,

"there can be no doubt that the concurrent right of the national government to make legal tender does not in any way affect the right of a State to make gold and silver coins, domestic and foreign, a legal tender within its borders. In 1792 Congress enacted that 371¼ grains fine silver be the money unit of the United States or the American dollar. This power was given by the States to Congress in order that it might create a legal uniformity of value of money in all the States, and, such a money unit having been created, there is high authority that the trust given to Congress in this respect is executed and can neither be changed by Congress nor the States."

THE WORLD'S FAIR IN RETROSPECT.

THE entire number of the *Engineering Magazine* for January is made up of articles dealing with the World's Fair in retrospect, the first of which is contributed by Mr. Andrew Carnegie, who sets forth the value of the Fair from a national point of view. He considers that the chief good from such an exhibition arises from the gathering together of the people of the different sections. "The Fair was to the people of the United States what the State Fair is to the people of the State. Every citizen became not only prouder than ever of his country, of whose position and greatness the exhibition was the outward and visible symbol, but he became acquainted, for the first time perhaps, with his fellow countrymen of other States. The impression made by the people *en masse* was highly complimentary to the American. I never heard a foreigner give his impression who failed to extol the remarkable behavior of the crowd, its good manners, temperance, kindliness and total absence of rude, selfish pushing for advantage which is usual in corresponding gatherings abroad. The self-governing capacity of the people shone forth resplendently. The foreigner's verdict is that without official direction or supervision every individual governed himself and behaved like a gentleman." So much for universal education.

Mr. Carnegie thinks that at least once every twenty years the people should be induced to gather from all the States as they did at Chicago, and, if possible, each section of the Union should be favored by having this national reunion. He says: "In a federation so extensive as ours this drawing together of the people of the States is a work of great difficulty, and yet it is of infinite importance, for the masses of the people should not grow up without having in their midst living links who have met their fellow-citizens from other States and found them much like themselves and in harmony upon one point at least—their intense Americanism. Every plan should, therefore, be encouraged which draws the people of the different States together, and an exhibition like that just held at Chicago is by far the most efficacious of all modes."

The International Effects of the Fair.

Writing in the same magazine on the international effects of the fair, Mr. Edmund Mitchell says: "It

has frequently been contended that international exhibitions have done little permanent good to mankind—that they are really carnivals of pleasure, that industry does not profit by the lessons they profess to teach. The complete falsity of such an argument must have been borne home to the mind of every one who made anything like a conscientious study of the Chicago World's Fair. Let me give a specific instance of ideas being exchanged at these exhibitions; and in doing so I shall of set purpose select small things to show that even the most minute details do not escape the lynx-eyed visitors. At Philadelphia, in 1876, Switzerland was completely cut out by America in the department of watch manufacture, the machine-made article of the latter company eclipsing the hand-made product of the former. In Chicago, in 1893, we witnessed the Swiss artisans making watches by the aid of all the latest and most delicate American machinery, and in not a few instances beating the United States manufacturers with their own tools. Had not an invaluable lesson been learned by the Swiss in this case?

A STEP TOWARD THE BROTHERHOOD OF MANKIND.

"Not the least valuable result of the World's Fair," continues Mr. Mitchell, "was the spirit of fraternity diffused among men of many varieties. Sentiments of brotherhood seemed to be in the air. In this respect Chicago gained an undoubted advantage over Paris, Vienna and every other European centre of population. On the soil of America there is no field for international bickerings and jealousies. At Chicago, German and Frenchman, Englishman and Russian, Turk and Bulgarian, met together on every festive and ceremonial occasion, and came to know each other, to appreciate each other, and to regard each other as warm personal friends. More especially was this happy result brought about by the excursions from Chicago into the surrounding country proffered by the American people among many other hospitalities to their visitors from abroad. Notable among these was the trip to the wheat-fields of North Dakota organized by the Chicago, Milwaukee and St. Paul and the Great Northern Railway companies, on which occasion men of twenty-nine different nationalities, speaking fifteen different languages, fraternized together during a period of nine days, and became intimately acquainted—an incident which, I venture to think, is almost without parallel. The spirit of brotherhood engendered by this close association was shown at Gretna, a village on Canadian soil, where the Stars and Stripes of the United States and the Union Jack of Great Britain and Ireland were saluted, and the happily expressed sentiment, 'May the Old Glory of the New World always float side by side in amity with the Older Glory of the Old World,' was cheered to the echo by Americans and Englishmen, Frenchmen and Russians, Germans and Poles, Italians and Spaniards, Swedes and Norwegians, Austrians and Turks, representatives of every South American republic and colony, and men from far away Australia, the Orange Free State and Japan. It augurs well for the federation of mankind that

such a chord of friendliness should have been struck and echoed through so many countries of the world. A little leaven leaveneth the whole lump, and the scene at Gretna on August 28, 1893, is one that will live long as a kindly memory in every corner of the globe."

A SOUTH CAROLINIAN'S VIEW OF THE DISPENSARY LIQUOR LAW.

"TO-DAY" contains an article on "The Dispensary Liquor Law of South Carolina," by one who subscribes himself "A South Carolinian." Though opposed to the liquor law, he frankly concedes to it certain merits.

The writer first presents the claims for the law as set forth in a recent message by Governor Tillman:

"1. The element of personal profits is destroyed, thereby removing the incentive to increase the sales.

"2. Treating is stopped, as the bottles are not opened on the premises.

"3. It is sold only in the day time; this under a regulation of the board and not under the law. The concomitants of ice, sugar, lemons, etc., being removed, there is not the same inclination to drink remaining, and the closing of the saloons, especially at night, and the prohibition of its sale by the drink, destroy the enticements and seductions which have caused so many men and boys to be led astray and enter on the downward course.

"4. It is sold only for cash, and there is no longer 'chalking up' for daily drinks against pay day. The workingman buys his bottle of whisky Saturday night and carries the rest of his wages home.

"5. Gambling dens, pool rooms and lewd houses, which have hitherto been run almost invariably in connection with the saloons, which were thus a stimulus to vice, separated from the sale of liquor have had their patronage reduced to a minimum, and there must necessarily follow a decrease of crime.

"6. The local whisky rings, which have been the curse of every municipality in the State, and have always controlled municipal elections, have been torn up root and branch, and the influence of the bar-keeper as a political manipulator is absolutely destroyed. The police, removed from the control of these debauching elements, will enforce the law against evil doing with more vigor, and a higher tone and greater purity in all governmental affairs must result."

PERSONAL PROFIT IS ELIMINATED.

As to the first of Governor Tillman's claims the writer points out that while the element of personal profit is removed, it is the element of *personal* profit only. "The money goes into no one man's pocket, but behind the men who deal the liquor across the bar stands the State, reaping the benefits of the pernicious traffic just as the saloon-keeper did a year ago. In his message Governor Tillman avows one great advantage of the law to be 'the reduction of the general tax.' In other words, instead of the saloon-keeper reaping the profit, it goes into the pockets of the taxpayers, thus making every property

holder in the State, *nolens volens* the beneficiary of a successful whisky traffic, and constituting each one a *particeps criminis* to just as great an extent, morally, as was the bar-keeper of a year ago. While the demoralizing effect may not be the same on the individual beneficiary, the principle is absolutely unchanged, and morally the condition is as evil in one case as in the other. Not a taxpayer in South Carolina to-day can deny that he is a stockholder in a great retail liquor saloon, and as soon as the general taxes are reduced, as has been promised, he will then and there receive his dividend on his stock as directly as a mill owner receives his when the annual profits of his mill are distributed."

THE MOST OBJECTIONABLE FEATURE.

The second, third, fourth and fifth claims are approved by the writer, but the sixth "is the objectionable one alone sufficient to condemn utterly the whole law." "The municipal whisky rings have, as is claimed, been destroyed, but in their stead has been raised up a ring which finds its province not in the towns and cities alone, but throughout the entire State, throttling at one grasp both town and country, and with a power behind it which would enable it to perpetuate itself practically for all time. A corrupt administration with such a power in its hands could perpetuate itself and its iniquities, absolutely proof against everything that might tend to its overthrow, except popular revolution. And the history of politics in the United States shows that nothing is more probable than at some not distant day the power created by this law will be so used. We can see the results of such power in almost any large city in the country. Few of us have to go far from home in order to study their workings and test their strength, but how insignificant will these appear in comparison with an organization which is not only composed of men who happen to be in charge of the affairs of state, but which is, to all intents and purposes, the State itself, in its official, corporate and sovereign capacity. No measure more fraught with danger to the liberties of the people has ever been devised in the whole history of American legislation, and unless South Carolina gets rid of the law she has saddled upon herself, her future will be pregnant with innumerable possibilities of political tyranny and disaster."

THE STATE AS A SALOON KEEPER.

The writer concludes: "What kind of a saloon-keeper she will make remains to be seen. So far she has done fairly well, she has conducted her business so wisely that a rich profit has resulted, and she declares that another year she will take a half million of the dollars of her suffering women and children, and put them into her pocket; with the characteristic zeal of a liquor dealer of the old *régime*, she declares her intention of extending her business into every nook and corner of her territory, and not lacking in the modern commercial spirit, she pledges herself to crush all competition, and to keep the field clear for her own exclusive operations. And she has made some excellent resolutions which she has not

broken. She will not sell to boys, nor will she offer her patrons the pleasures of a club house; she does things in a strictly business way, and like an honest man, when night comes she shuts up her saloon and goes home. Any saloon-keeper in the world would be commended for such a course, and South Carolina is worthy of the same commendation, and we extend it most heartily. But all the same she is a saloon-keeper, and her rulers might split hairs and invent new names for the business from now until the crash of doom, but they cannot change that fact. If Governor Tillman and his friends wish to rid their State of this stigma, they can only do so by abandoning the traffic instantly."

"THE LIVING WAGE."

ECONOMIC opinion on this much vexed question is what the public specially needs to have; and they will turn with well-founded interest to Professor Cuninghame's article on the subject in the *Contemporary Review*. The writer, while deriding the idea that "economic laws" are moral precepts or practical imperatives, recognizes their worth as convenient hypotheses and as guides to what is likely.

The "standard of living" is the familiar economic conception which corresponds to the popular "living wage." The Professor, in pointing out that the standard varies with each social grade, does not shrink from defining it: "The worker in each class believes that by his work he ought to be able to support himself and start his children in the same social grade in which he was brought up. This is his standard of comfort, and a living wage is the wage which enables him to attain his object regularly and habitually. The ordinary rate of wage which the ordinary workman has earned in ordinary times may be taken as representing the standard of living of his class, and may be therefore called a living wage. There ought to be no insuperable difficulty in any one trade in calculating what this living wage has been within the last decade.

HOW IT MIGHT BE FIXED.

"Experience seems to show that the real practical difficulties of calculations of this sort can be met if the parties concerned really give their minds to it and honestly make the attempt. Such a board as that which is to meet in February could surely manage it for the coal trade. . . . If an agreement as to the rate of variation can be maintained, an agreement as to an invariable rate till a recognized date for reconsideration and readjustment might be carried out.

"The advocates of the living wage may fairly claim that they only seek to give effect to a principle which has high . . . economic authority, and is confirmed by the experience of practical men."

HOW IT WOULD WORK.

For the laborer the establishment of the principle would mean in times of bad trade an increase in the number of individuals unemployed, but that evil is preferable to the lowering of a whole class below the standard of decent living.

"The living wage would give no immunity from industrial distress, but it would tend to limit its duration; it would maintain the position of a class and cause the distress to fall on individuals, and it would open up possibilities of remedy which are not now available without pauperization."

It would also benefit the employer by discouraging speculative production and reckless competition, and by diminishing existing uncertainties as to the rate of wages. The Professor defends the principle on national as well as on economic grounds. The approaching exhaustion of England's coal fields would, he argues, be by it rendered gradual, through the gradual diminution of employment.

The Professor much prefers the principle of the living wage to that of profit-sharing. The latter he condemns as "unwise economically and unsound morally."

"The Minimum of Humane Living."

Under this strange title Mr. W. H. Mallock writes in the *Pall Mall Magazine*. This minimum is, he argues, "determined by the maximum which a man who pays no rent can extract by his own labor from the worst soil under cultivation." He illustrates this by facetious diagrams.

HOW MANY MAKE THEIR BREAD AND BUTTER?

MR. JUNIUS HENRI BROWNE writes in the January *Harper's* on what he calls "The Bread-and-Butter Question," and calls to mind that, pecuniarily considered, we are not nearly so prosperous a people as the general report would have it. He makes it out that, especially in the great cities, the bread-and-butter question is one always with the majority of us—even of us, the money-making folk of the world. Mr. Browne asserts that reports of our individual prosperity are always exaggerated, and that one hears of but a meagre proportion of the cases of total failure to solve the bread-and-butter question. This is especially true in great cities. He asks how many thousands of professional men there must be in New York who are unable to make the \$5,000 per year generally agreed to be necessary to support only decently the man with a family. All this bad state of things is not because we receive smaller salaries and incomes than of old years, for we undeniably receive greater ones, but because we need more things to make us comfortable, and because prices have risen in a majority of cases.

THIRTY YEARS AGO.

"Twenty-five or thirty years ago what is known as the bread-and-butter question came home to but a small proportion of those in whose breasts it is now a settled resident. Then the majority of the members of what might be termed the middle class, in a financial sense, working with their heads, not their hands, and moderately equipped for the secular battle, gave themselves small concern as to the acquisition of their living expenses. Now, though they may earn far more than they could then, they are prone to

be ceaselessly harried on the subject. Not only have prices steadily advanced, the needs of those members have increased and their tastes are more exacting. They want five things where they wanted one. What were luxuries have become necessities. They were contented on \$2,000 a year; they are discontented on \$4,000. What they would have considered a modest independence would not make them comfortable now.

AS IT IS NOW.

"Everything" has altered, not the manner and requirement of living merely, but the lives themselves. They no longer have the same feelings or opinions, or see with the same eyes. They feel, though they have so much more than they once had, the lack of what they want to-day far beyond the greater lack of years ago, which, being unexpected, they were barely sensible of. This may seem to be their fault, and to an extent it is; but it is more the fault of the time that has so begotten the growth and love of luxury as to make it, through familiarity, appear indispensable. At any rate, luxury has unconsciously entered—in cities notably—into the bread-and-butter question, which is more serious, more imperative, than in the days of simplicity and self denial. When we are satisfied with little, a diminution of that little is scarcely missed. When we are accustomed to excess, we think we cannot spare the slightest portion. The idea of material comfort is most variable and indefinite. In the rural regions of New England a small family attains what it considers such comfort by an expenditure of \$400 a year. In New York a family of the same size is frequently uncomfortable after disbursing fifteen times that amount. But in the real country and in the great town the question is vital alike, and the source of unremitting thought and great anxiety."

THE PROFESSIONS OVERCROWDED.

Mr. Browne goes into the favored occupations—the law, banking, etc.—in detail to show that they are overcrowded, and are far from offering a general average of comfortable remuneration. He naturally does not attempt to offer any direct remedy for this very deeply rooted ill of life, but he does draw from it a moral as to pretension and lack of courage to look facts in the face.

"It is debasing to be absorbed in the chase after dollars for dollars' sake; but it is more debasing still to pretend to have wealth that one has not, and to lead a course of interminable self-exploitation. The bread-and-butter question must long continue to be the essential question for the mass of us; but it should not be where possible ease of circumstance exists. We should be ashamed to give a false impression of ourselves in anything. If we can afford only beef and potatoes and beer, why invite our friends to a dinner of ten courses with wine? Most of us are poor for our needs or desires. Let us avow it, and the terrible bread-and-butter question will be shorn of many of its terrors. Simplicity and honesty will prove in time the antidote to its wide-spreading bane."

TRAMPS.

PROFESSOR JOHN J. MCCOOK presents in the *Charities Review* a social study of "Tramps." We learn from Mr. McCook's account that this name is not in general favor among tramps themselves. "Bum" is the generic term used by them. It is interesting to note that there exists an aristocracy among tramps, and a middle and a lower order, although, Mr. McCook adds, absolute agreement has not been made as to which is upper and which is lower crust. The order of "jumpers"—that is, train jumpers—put their family first and look upon the country or "pike bum," the city or "shovel bum," and the mission or "religious bum" with undisguised contempt. The accepted title for the railroad tramps in America is "ho-bo's," or as it is spelled by the most select of the nobility, "haut-beaux." Mr. McCook gives the following incidents concerning the career of one of the ho-bo's he has met:

THE CAREER OF A "HO-BO."

"He had 'done' thirty days each in Erie County, N. Y.; White Plains, N. Y.; Brooklyn, Conn.; thirteen days in San Francisco, Cal.; twenty days in Savannah, Ga.; ten days in Chicago; five days in the Tombs, New York City, and had been arrested in Syracuse, N. Y., and Richmond, Va.

"He had passed part of one winter in an almshouse—to 'get a new suit of clothes'—had been nine days in Charity Hospital, Blackwell's Island, for a finger bruise got in jumping a train; six weeks in a Philadelphia hospital for a secret disease—they have no aversion to such a disease when winter is coming on, he told me in passing, and several eminent medical specialists confirm his story; a whole winter in a poor-house hospital in the interior of New York for a toe lost while jumping a train; five months in a Boston hospital for an abscess on his neck, caused, as the doctors thought, by the jar of riding on trucks—he had only been six months on the road at that time, he explained apologetically! And he had also been to dispensaries now and then for medicine required by some trifling cold, though he generally carried stuff with him for this.

"Apart from the above he had 'never had a day's sickness in his life,' he said, and spoke with much enthusiasm of the vigor and physical strength of the fairly initiated ho-bo."

This aristocratic vagabond said that he had voted eight times in one single election in New York City, receiving therefor a total of sixteen dollars, which, of course, may or may not be true.

SOME STATISTICS.

It is estimated by Mr. McCook that there are about forty-six thousand tramps in the United States. This estimate is based on a statistical investigation of tramps living in Massachusetts, that State being the only one which attempts to collect the facts necessary for a calculation. Mr. McCook further estimates that fifty-seven per cent. of our American tramps have trades or professions, forty-one per cent. are un-

skilled laborers, one in twenty is under twenty years of age, three out of five are under thirty-five, seventy-five out of one hundred under forty and one in one hundred and eleven over seventy. He believes that industrial causes have little to do with vagabondage, holding that intemperance is chiefly responsible for it. Sixty-three per cent. of the tramps with whom he has communicated are confessedly intemperate. Mr. McCook says further that fifty-six per cent. of our tramps are of American nativity, that more than nine-tenths of them are unmarried and that a like proportion can read and write.

HOW TRAMPS SECURE FOOD.

How do they generally secure their food? "Twenty per cent. say they beg; nine per cent. more 'beg and work'; over two per cent. more 'beg and steal'; three per cent. live on their 'friends'; twenty-seven per cent. 'work' or 'work and want'; thirty-eight per cent say they pay for it. How for the most part this is done is left to the imagination. I am convinced that the life of a fraction, possibly the greater part of this company, consists in alternations of work and travel or debauchery. The work is suspended as soon as the means for the last named has been secured, and the 'sobering up' is commonly at public expense. Counting their house room at nothing, I am convinced that two hundred and forty dollars a year would be a moderate and two hundred dollars a very conservative estimate for the actual cost per head of our army of tramps. This would amount to about ten millions annually. This has to be paid for, of course, by somebody, and that somebody is the tax-payer."

Mr. McCook recommends uniform laws in all the States, committing drunkards and vagrants to places of detention where they must abstain from drink, must work, and must keep clean, and that for an indefinite period. He thinks that they might be made to nearly or quite support themselves in such establishments, and in that event we would save \$10,000,000 or more a year.

CRUSADE AGAINST ANARCHISM.

AS might have been expected, the bombs exploded at Barcelona and Paris have shaken literary nerves and provoked something like literary reprisals. Karl Blind sketches in the *Contemporary* "the rise and development of Anarchism." With no little animus he marks out Proudhon as the spiritual and Bakunin as the practical father of the present Anarchism.

"Out of Proudhonism there certainly came a spirit of wanton destructiveness, of devil-dare unconcernedness as to consequences, on which the Anarchist doctrine soon thrived and flourished. That erratic Bakunin declared that in order to bring about the abolition of State formations and governments which were to be superseded by small groups of independent workers, it would be necessary to 'unloose all the passions now called evil, and to destroy what is by the same class of speakers called public order.'" So originated the "propaganda by deed."

The London Colony.

The *New Review* opens with a double broadside against the Anarchists. "Z." divides them into "the ideal and the real," and would make the former, "such fanatics as Prince Krapotkin," responsible for Ravachol and Pallas. The worst specimens in London are foreigners. Frenchmen preponderate. Germans are "the most advanced;" Hungarians "the most truculent and unscrupulous." There are also a few Poles, Russians, Spaniards, and a number of Italians.

"These are the miscreants who are now aspiring to terrorize the world; the very dregs of the population, the riff-raff of rascaldom, professional thieves, bullies who batten upon the shameful earnings of the weaker sex, cut-throats when opportunity offers, depicable desperadoes already under the ban and always subjected to close surveillance."

"Z." cries for summary suppression of Anarchic propaganda and literature. He specially urges that Herr Most's "Scientific Revolutionary War," a guide to making and using the worst explosives, should be burnt wholesale, its mere possession deemed a felony.

DIPLOMACY OLD AND NEW.

THE December number of the *Revue des Deux Mondes* gives the place of honor to a couple of striking articles on "The Transformation of Diplomacy." It is unsigned but bears trace of a practiced hand. The slow changes by which Europe, rendered chaotic by the decay of the Roman empire and the invasion of the Caucasian hosts under Attila, has been molded into our modern states and kept in a relative equilibrium, are treated in a philosophical and also in a poetical spirit. The paper opens with a short description of diplomacy as understood during the last two hundred years. The French language reigned supreme in every Court where diplomatic interests were discussed. Diplomacy resembled in those days a mediæval drama, in which a fight begun with foils ended in bloodshed when the buttons dropped off.

ADOLPHE DE CIRCOURT, FRENCH DIPLOMAT.

The writer describes finely an old French diplomat dead within the last twenty years. He is not named, but to those who know France it is needless to name the Comte Adolphe de Circourt, sent by Lamartine to Berlin in 1848, and well acquainted with the best circles in England, as indeed in every country in Europe. Equally at ease in history and in politics, he saw the present in its true prospective with the past, and quitted the banqueting hall of Charles V. of Spain to cross over into the private apartments of M. de Bismarck. "Never shall I forget," says the writer of the article in the *Revue des Deux Mondes*, "his art of touching with a master hand on the highest questions; those rapid sketches, that respectful familiarity with the great historic figures of all ages, who seem to have been his familiar friends. One felt flattered to be introduced almost on an equal footing into such good company. Adolphe de Cir-

court survived the German war, and saw the irresistible rise of the great democracy which little by little is changing the old polite methods of the European game of chess. "Henceforth the learned play of the European balance of power will be profoundly disturbed. Another era opens: it is our own."

MODERN DIPLOMACY.

In the second and concluding article the writer attempts to deal with modern diplomacy. There are in Europe kings, governments and peoples; there are no longer courts. The elaborate procedure of other days has been put away among other theatrical properties in company with the peruke, powder and silk stockings. If you were to insert in a diplomatic dispatch expressions once universal, such as "the Court of St. James," "the Court of Vienna," you would have been thought to have fallen asleep a hundred years ago. Now diplomats write of "the Cabinet of London," "the Cabinet of Vienna." Even the word "courtier" is out of fashion and expresses a way of acting and a kind of character indicating anything but a good social position.

The receptions given at Compiègne, under the Second Empire, where the young Empress held the sceptre of a reigning beauty and model of fashion with the gracious manners and political passions of Marie Antoinette, were, our writer thinks, the last example of the attempt to revive or imitate the ancient court; and since it suffered dire eclipse in 1870, even the older sovereigns have reduced the number of their servitors, and may even be said to practice economy. The two most absolute of our European monarchs indulge in little or no amusement; they work from early morning till late at night, and live a strictly honorable domestic life.

The writer here pays a sincere and respectful compliment to the Queen of England, whose "incessant though hidden toil" and perfect accomplishment of her constitutional duties have given her an influence hardly to be expressed in words. "When this long reign shall be judged from across a lapse of years, it will be seen that the Victorian era brought Parliamentary institutions to a degree of perfection, increased the dignity of social manners, fortified that respect which should always be felt for the law, and allowed of the accomplishment of great evolutions without violence; in fine, it will be seen that the England of Victoria was infinitely more peaceful and happier if not more heroic than that of the Georges."

A CHANGE IN DIPLOMATIC METHODS.

When discussing the growth of the power of the people under the changes it had brought about in diplomatic methods, the writer observes that in diplomacy as in everything else it is better to be straightforward. A Richelieu, a Frederick, a Bonaparte, a Cavour, a Bismarck, do not need to hide their schemes, for the durable part of the work must repose on their power of discerning a great idea or defending a great cause.

The political thinker will find much on which to reflect in this remarkable article, which evidently proceeds from one who knows the subject of which

he treats, and who yet may claim a singularly impartial judgment.

UNIVERSITY EXTENSION IN GERMANY.

IN the December number of the *University Extension World* Mr. O. J. Thatcher gives a brief sketch of the Urania Gesellschaft of Berlin—a society which, while not technically known as a University Extension organization, is doing a great deal to promote education among the masses and awaken a widespread interest in natural science.

Mr. Thatcher writes: "The Urania Gesellschaft was established March 4, 1888, by a number of wealthy residents of Berlin, who not only loved nature but wished to cultivate in their fellow citizens a love for, and an appreciation of, the beauties, secrets and mysteries of the natural world about them. A site was at once secured from the government, and the buildings were completed and formally opened with appropriate ceremonies on July 1, 1889.

THE GENERAL PLAN OF THE GESELLSCHAFT.

"The general plan of the Gesellschaft is to equip for public use several laboratories, for astronomy, physics, biology, etc., with the best and most important apparatus. On the payment of a very small fee any one is admitted to these laboratories and may freely examine and use, or see used, any of the instruments.

"Every day at certain hours lectures are given on various topics chosen from the field of natural science. In these lectures the attempt is made to present a clear, succinct, popular, scientific statement of the subject in hand. Such subjects as the tides, the formation of mountains, volcanoes, clouds, the single planets, meteors, fixed stars and many others are thus treated, and generally the little hall is crowded with eager listeners. The Astronomical Observatory is supplied with an excellent telescope (the largest one in Prussia) and all the instruments necessary for the practical study of astronomy and the observation of the heavenly bodies.

"Connected with the Urania is a large staff of enthusiastic scientists, mostly young men, who carry on their own investigations, deliver public lectures and instruct classes in science. The classes are generally held in the evening, and are composed of men and women who have a desire for such knowledge, but who have not been able to acquire an education. The Gesellschaft also publishes one of the best scientific journals of Europe under the title *Himmel und Erde* (Heaven and Earth). It is popular in the best sense of the word, richly illustrated, and has among its editors and contributors nearly all the great scientists of Germany.

"Another unique feature is the Theatre of Science, a hall which seats several hundred people, and has a large stage adapted to the presentation of scenery illustrative of scientific subjects. The performance consists of a lecture on some subject from science, illustrated by the constantly shifting scenery on the stage. These lectures occur daily, and a wide range of topics is treated."

THE DECLINE OF URBAN IMMIGRATION.

ALL persons having to deal with the social problems of our great cities would do well to note the very significant statistics compiled by Mr. Edwin Cannan in his *National Review* article on "The Decline of Urban Immigration." His pages simply bristle with facts and comments of the most instructive order. Here are some compendious tables :

GAINS AND LOSSES BY MIGRATION.

	1851-60.	1861-70.	1871-80.	1881-90.

Thus, instead of an increasing rush to the towns of England there has been a drop of 450,000 during the last census-decade! Mr. Cannan concludes with the reflection: "The superior healthiness of the modern town enables it to increase its population very rapidly, simply by the excess of births over deaths, and it seems highly probable that in the future our great towns will be regarded as the cradle rather than the grave of population."

In the *Nouvelle Revue* a certain Commandant Z. sounds a note of alarm as regards the defenses of the coast of Corsica. He points out that this island is the only place of call for the French fleet between Algiers and Marseilles, and Toulon and Bizerta, and insists that Corsica, in case of war, would be the pivot on which much of the success or failure of the French navy would turn.

THE "REAL" DISCOVERER OF AMERICA.

Not Columbus, but Cousin!

"JEAN COUSIN, sea captain of Dieppe, discovered the River Amazon in 1488. Columbus discovered San Salvador in 1492, or four years later." With these plain statements Captain Gambier, of the Royal Navy, opens an indictment in the *Fortnightly* which, if finally substantiated, will completely destroy the unique fame of Columbus as explorer and man, and will turn the use of the names "Columbia," "Columbian," into a farce. For this is the damning count in the indictment, not that Cousin forestalled Columbus but that Columbus knew of Cousin's discovery, though the knowledge was carefully and by conspiracy suppressed, and on the strength of that knowledge got his commission and his ships from Isabella. The claims for Cousin as stated by Capt. Gambier are as follows:

NORMAN AND SPANIARD.

Cousin was trained under Toscanelli, who first suggested to Columbus the idea of going to the east by the west. In naval war with the English in 1487 Cousin so distinguished himself that the merchants of Dieppe—at that time the Portsmouth and Liverpool combined of France—gave him command of an armed ship to go out in search of discoveries. In January, 1488, he set sail with Vincent Pinçon, a Spaniard, second in command. "Cousin sailed west for two months, and eventually found himself in the mouth of a vast river, whose size clearly indicated that it drained a country of great size and no mere island. This river he called the Maragnon." He then sailed for the African coast, his ostensible destination from the first, for trading purposes. But Pinçon quarreled with natives and imperiled the African trade. This untoward result cast the wonder of the American discovery into the shade. The people of Dieppe sentenced Pinçon to perpetual banishment from France.

SINGULAR COINCIDENCES.

Pinçon then went to Genoa, and subsequently to his two brothers, Martin Alonzo and Martin, at Palos. At the same time Columbus suddenly gives up his idea of going with his brother-in-law to France, and goes to La Rabida, near Palos. The head of this monastery, ex-confessor of the Queen, and close friend of Fernandez, an intimate of the brothers Pinçon, "becomes suddenly converted" to the practicability of Columbus's scheme, writes the Queen to that effect, and introduces Columbus to Fernandez. Then the Queen suddenly resolves to help Columbus. Columbus then insists, as never before, on title and pay as a reward for his anticipated discoveries. Finally he gets all he wants and goes to Palos. The three Pinçons are at Palos, and ardently support him. The three Pinçons, including Vincent, the ex-Dieppe lieutenant, go off with Columbus.

POETIC JUSTICE.

After sailing 1,200 miles, at a council of captains called to consider turning back, the Pinçons resist the

suggestion vehemently, and clamor for Columbus to steer more south. On return to Spain after the historic "discovery," Vincent Pinçon hurries off to see the Queen, to try and get his word in before Columbus. "Having done his best to rob Cousin of the credit of the discovery by giving all his information to Columbus and his brothers *sub rosa*, he now tries to rob Columbus of his share of what glory is left, and distinctly lays claim to it for himself. . . . He declared that without him Columbus could never have found anything. . . . But the same state reasons that would have made Cousin's claim impossible crushed Pinçon's."

A CONSPIRACY OF SILENCE.

Spain, wanting the New World for herself, had reason enough to conceal its prior discovery by France; the Pope, hostile to France, indorsed the claims of Spain, and France was distracted by civil war. Cousin "went down in a sea fight."

"The only possible loophole of escape" which Capt. Gambier allows for those who claim the undivided honor of the discovery of America for Columbus is to prove that the Vincent Pinçon who sailed with Columbus is not the same man as Vincent Pinçon who sailed with Cousin.

Against this he recalls that "the brothers Pinçon, soon after their return with Columbus from his first voyage, equip and dispatch a fleet of four ships to this very identical river Maragnon (the Amazon), under the command of Vincent Pinçon. Clearly, therefore, they knew that this river existed, and how did they know it . . . unless the man called Pinçon commanding these ships had been there before?"

THE POPULATION OF HAWAII.

THE following paragraph relating to the area and population of the Hawaiian Islands appears in *The Gospel in All Lands*:

"Hawaii embraces several islands in the Pacific Ocean, 2,100 miles west of San Francisco and 3,440 miles east of Japan, the largest being Hawaii, Maui, Oahu, Kauai, Molokai, Lanai, Nihau and Kahoolawe. The total area of the islands is 6,640 square miles, with a population in 1890 of 89,990, less than one-half being native. The census of 1890 showed there were 34,436 natives, 6,186 half castes, 7,495 born in Hawaii of foreign parents, 15,301 Chinese, 12,360 Japanese, 8,602 Portuguese, 1,928 Americans, 1,344 British, 1,034 Germans, 227 Norwegians, 70 French, 588 Polynesians and 419 other foreigners. It is estimated that when Captain Cook discovered the islands in 1778 the population numbered 200,000, since which time the natives have rapidly decreased. The capital, Honolulu, is in the island of Oahu, and has about 21,000 inhabitants. The latest religious statistics reported 29,685 Protestants, 20,072 Roman Catholics, 3,576 Mormons, 72 Jews, 30,821 undesignated. In 1892 there were 168 schools and 10,712 pupils, of whom 5,353 were Hawaiian."

OLD AND NEW EPIDEMICS.

AS sub-title to "Studies in Hygiene" M. R. Proust discusses in the *Revue des Deux Mondes* the many old and new epidemics which have from time to time devastated the world. As is perhaps natural, the first contagious disease he attacks is the influenza, which he declares to have first come from St. Petersburg and Moscow, reaching rapidly Odessa, Stockholm, Varsovia—all towns in direct communication with the two great Russian cities. It has been conclusively proved, says M. Proust, that where civil communications are cut off, the influenza ceases. Thus the disease took more than a month to travel from Stockholm to Christiania, which are separated by mountains; but once *la grippe* had reached Berlin it extended in less than a week to Vienna, Paris, Amsterdam and London. On the vexed question as to whether influenza is catching in the ordinary sense of the word, M. Proust's evidence seems to be decisive, for he quotes the town of Frontignon, where the arrival of one person from Paris served to infect the town; and to cite a still more curious fact, it seems that out of the four hundred lighthouse keepers which inhabit the seventy-seven lighthouses placed on the coasts of Great Britain, only eight caught the epidemic, and those eight had each been exposed to a distinct contagion.

SMALLPOX.

Smallpox, declares M. Proust, seems to have been unknown among the Greeks and Romans, though in China and India there are traces of the dread disease 1,200 years before Christ. The Saracens brought smallpox to Europe in the sixth century, and Gregory of Tours wrote down the first known description of its symptoms. In the seventeenth century smallpox was more dreaded than the black death. All Louis XIV's direct descendants, with the exception of the child who, strangely enough, finally fell a victim when an aged king to the same disease, disappeared in a short space of time, carried off by this terrible *petite verole*. When the infection was brought to countries where the plague had been hitherto unknown, the result was terrible. In Mexico alone were carried off three and a half millions; and the Inquisition, Spanish invasion, alcohol and sword all together did not contribute to the destruction of the native population of North and South America as did the introduction of smallpox into the transatlantic continent.

MEASLES AND SCARLATINA.

Measles seems to have appeared in Europe about the same time as smallpox, but to the Arabs the troublesome and catching disorder was well known under the name of hasbah. Australia is the only part of the world where measles is unknown.

Scarlatina, observes M. Proust, is a distinctly European malady, and is especially affected by the English. In London alone each year between 2,000 and 6,000 people die of scarlatina, and he adds the incredible statement that only 100 deaths are attributed to the same cause.

The history of typhus is specially curious. The first description of this fever was written by Fracastor, and the first serious epidemic of it ravaged the army of Lautrec when encamping near Naples. In Europe, Ireland and Silesia are the birthplace and home of typhus, and wherever the Irish emigrant has gone there typhus has followed. To Silesia is due the prevalence of the disease in Eastern Prussia, Sweden and Denmark.

TYPHUS.

Typhus, it seems, is terribly catching, doctors and nurses falling more easily a victim in devotion to their patients than in any other infectious disease. In the Crimea out of 450 medical men 58 died of typhus. Typhus, said Professor Virchow, is the punishment which nations draw down on themselves by their ignorance and their indifference. M. Proust quotes largely from the curious memoirs of Marais, which describes vividly the terrible epidemic which fell upon Versailles in the summer of 1720, and of the heroic efforts made by the Archbishop, Monsignor de Belzunc, to combat the evil. The pest seems to have inspired more terror than any other disease. As late as 1878 in Russia the sick were left by both their friends and neighbors without food, without clothes, and without care, while the dead remained days before any one thought of burying them. During the last fifteen years the pest has come no nearer Europe than Bagdad, but the general opinion of the medical faculty seems to be that every care should be taken, for in many Indian provinces, in Tonkin, and in China, this disease seems indigenous to the soil.

YELLOW FEVER AND CHOLERA.

In the old days, remarks M. Proust, yellow fever was never supposed to leave certain warm latitudes; but although it must be admitted that a hot country seems specially productive of the disease, in 1861 a terrible epidemic of yellow fever broke out at St. Nazaire, and cases have been known both at Havre and in England. In Europe, the country most afflicted with yellow fever is Spain, and in certain towns one-fifth of the population disappeared through an outbreak of the malady.

From an exhaustive study of the causes which lead to outbreaks of cholera, M. Proust declares that there is no doubt that the disease follows certain determined routes, and he points out that the quicker the modes of communication between certain places the quicker the epidemic travels along, and he attributes the late prevalence of cholera in Europe partly to the Russian conquest of Turkestan. The epidemic of 1891 to 1892 took six months to travel from Afghanistan to the Caspian Sea, while the epidemics which took place at the beginning of the century took years following the same road.

The worst epidemic of cholera which has taken place this century occurred at Mecca. It is almost impossible to verify the lists of deaths; 40,000 are spoken of as the number, and few of the pilgrims journeying to the holy city returned home. M. Proust sums up his article by declaring that on all

the great Eastern railway lines should be established sanitary stations, where both preventive and curative measures could be applied by a thoroughly efficient staff of nurses and medical men.

HOW CHLOROFORM WAS DISCOVERED.

“SIR JAMES SIMPSON'S Introduction of Chloroform” is most graphically described in the *Century* by his daughter, Miss Eve Blantyre Simpson. The popular notion that men stumble by pure chance on great discoveries, that he that seeketh *not* findeth, is once more refuted. It is additionally interesting to be reminded that the long quest at last rewarded by the capture of this anæsthetic had its motive in the sensitive humanity of youth.

“When James Young Simpson was only a student in his teens, the agony of a woman under the knife, though in the skillful hands of Mr. Liston, horrified him in such measure that from beholding her torture (which was torture also to his sympathetic nature) he went to seek work in the courts of law rather than to suffer more in the school of medicine. He, however, never became a writer's clerk. The student had turned his flying footsteps from the Parliament House back to the study of the healing art, and from that hour he resolved, when he became enrolled in the ranks of medicine, to devote himself to mitigate in some manner the dreadful agonies which were endured within the grim walls of the Royal Infirmary.”

A SÉANCE OF DARING EXPERIMENTERS.

With strange prevision of the latest investigations he began in 1837 to look to mesmerism as affording a promise of what he sought. He pondered much Sir H. Davy's experiments with nitrous oxide gas, Faraday's and Goodman's observations, and finally Dr. Morton's (of Boston) discovery in 1846 of the anæsthetic effects of sulphuric ether. The hunt was now becoming very hot. Simpson and his assistants kept working night after night into the small hours of the morning. He pondered much over the sleeping draft in “Romeo and Juliet,” and was often heard repeating:

Not poppy, nor mandragora,
Nor all the drowsy syrups of the world,
Shall ever medicine thee to that sweet sleep.

“It was his custom every evening to have an anæsthetic *séance*. In company with Dr. George Keith and Dr. Mathews Duncan he there tried various compounds of a narcotic nature with a boldness not to be daunted by the thought that the experimenters might cross the boundary of unconsciousness never to return.” They tried all sorts of ethers, oils, gases and vapors. “An old friend from Bathgate” told Simpson of a new method of making chloric ether—by making first pure chloroform and then diluting it with alcohol. The substance chloroform had been “discovered at nearly the same time by Guthrie in America (1831), by Soubeiran in France (1831), and by Liebig in Germany (1832).” Its chemical composition was first ascertained by Professor Dumas. Simpson got the chloroform, but after seeing the

"heavy unvolatile-like liquid" he despaired of it, and kept it for days in the house without trying it.

ALL UNDER THE TABLE IN A TRICE.

At last, late in the night of November 4, 1847, "on searching for another object among some loose paper," his "hand chanced to fall upon" the bottle of chloroform. He decided to experiment. He poured some of the fluid into tumblers before Drs. Keith and Mathews Duncan and himself. "Before sitting down to supper we all inhaled the fluid, and were all 'under the mahogany' in a trice, to my wife's consternation and alarm." This is Simpson's own account of it written on December 3 following. Professor Miller (not himself present) thus described the results of this memorable inhalation: "Immediately an unwonted hilarity seized the party; they became bright-eyed, very happy and very loquacious, expatiating on the delicious aroma of the new fluid. The conversation was of unusual intelligence, and quite charmed the listeners. . . . But suddenly there was a talk of sounds being heard like those of a cotton-mill, louder and louder; a moment more, then all was quiet, and then a crash. On awaking, Dr. Simpson's first perception was mental. "This is far stronger and better than ether," said he to himself. His second was to note that he was prostrate on the floor. . . . Hearing a noise, he turned about, and saw Dr. Duncan beneath a chair, . . . quite unconscious, and snoring in a most determined and alarming manner. . . . And then his eyes overtook Dr. Keith's feet and legs making valorous efforts to overturn the supper table."

"IT WILL TURN THE WORLD UPSIDE DOWN."

An aunt of the writer, Miss Grindlay, who was present, and is now over eighty years of age, persists, as for the last twenty years, in this account:

"She says my father came into the room with his short, brisk step, and took out of his waistcoat pocket a little phial, and, holding it up, said, 'See this; it will turn the world upside down.' Helping himself to a tumbler off the sideboard, he poured in a few drops, inhaled it, and fell unconscious on the floor, to my mother's horror."

Dr. George Keith avers that he "began to inhale it a few minutes before the others." In support of Miss Grindlay's version is the general witness about Simpson that "he tried everything on himself first." But for Dr. Lyon Playfair's intervention, Simpson would once have inhaled a new liquid, which in a subsequent experiment with rabbits turned out to be poisonous. The various narratives by eye-witnesses form quite a model study in historical criticism.

AN interesting article in *Elsevier's Geïllustreerd Maandschrift* is that on "Croup and Diphtheria," by M. Buijsman. The article deals chiefly with the latter malady. The differences between the two diseases, says the writer, chiefly consists in the presence, in diphtheria, of a large number of bacteria in the mucus membrane and even in other parts of the body.

THE SERMON ON THE MOUNT, OR THE CREED?

Count Tolstol's Condemnation of the Churches.

"THE preaching of Christ and the practice of His Churches" is the title under which Count Lyof Tolstoi communicates to the *New Review* certain extracts from his forthcoming work, "The Kingdom of God Within Us." The Count complains that the Churchmen who have criticised his "What I Believe" have not answered the straight question, "Do they or do they not admit the teaching of the Sermon on the Mount and the commandment of non-resistance to evil as binding on a Christian?" Their only answers have been merely to assert that the use of force is enjoined on the Christian, or is necessary to prevent ruin to all good men, or to protect one's neighbors if not oneself, or does not, though forbidden, involve the rejection of Christianity; or that the question has been settled long ago.

DID CHRIST FOUND THE CHURCH?

Christ's simple teaching, says Tolstoi, was early misunderstood, obscured, and, therefore, felt to need external proofs. Hence a growing introduction of the miraculous and the final claim of the Church to infallibility. "Yet nowhere, nor in anything, except in the assertion of the Church, can we find that God or Christ founded anything like what churchmen understand by the Church. From . . . two passages in which the word church is used, in the signification merely of an assembly, has been deduced all that we now understand by the Church. But Christ could not have founded the Church—that is, what we now understand by that word. For nothing like the idea of the Church as we know it now, with its sacraments, miracles, and, above all, its claim to infallibility, is to be found either in Christ's words or in the ideas of the men of that time.

"There is but one strict and exact definition of what is a church . . . a church is a body of men who claim for themselves that they are in complete and sole possession of the truth."

The Churches have "never bound men into unity: they have always been one of the principal causes of division. They have never served as mediators between man and God. Every step forward along the path pointed out for us by Christ is a step toward their destruction." The Count speaks not of one Church, but of "the Churches of all denominations." He exclaims: "The Sermon on the Mount, or the Creed. One cannot believe in both. And Churchmen have chosen the latter." The principal reason why Christ's teaching has been misunderstood, and the source of all other mistaken ideas about it, is "the notion that Christianity is a doctrine which can be accepted or rejected without any change of life."

THE CHRISTIAN VERSUS THE SOCIAL THEORY.

The Christian theory of life is to the modern "social or heathen" theory what that was to the savage, seemingly impossible, supernatural, but actually practicable and rational. "There is in reality noth-

ing mysterious, mystic, or supernatural about the Christian doctrine. It is simply the theory of life which is appropriate to the present degree of material development, the present stage of growth of humanity and which must therefore inevitably be accepted.

"The time will come—it is already coming—when the Christian principles of equality and fraternity, community of property, non-resistance of evil by force, will appear just as natural and simple as the principles of family or social life seem to us now.

CONSCIENCE AND CONDUCT IN CONTRADICTION.

"We are guided in economical, political, and international questions by the principles which were appropriate to men of three or five thousand years ago, though they are directly opposed to our conscience and the conditions of life in which we are placed to-day.

"We all know and cannot help knowing that we are all sons of one Father, we are all brothers and are all subject to the same law of love. . . . Yet, at the same time, every one sees all round him the division of men into two castes—the one laboring, oppressed, poor and suffering; the other idle, oppressing, luxurious and profligate."

Every one sees—and perpetuates it, continues Tolstoi. Whence the misery of contradiction between conscience and conduct. The sufferings of the working classes are increased tenfold by the knowledge that they ought to be treated as brothers and are treated like slaves. "The man of the so-called educated classes lives in still more glaring inconsistency and suffering."

"He knows that all the habits in which he has been brought up, and which he could not give up without suffering, can only be satisfied through the exhausting, often fatal, toil of oppressed laborers."

"WE ARE ALL BROTHERS, BUT ———."

We are all brethren, but every morning I must have a cigar, a sweetmeat, an ice and such things, which my brothers and sisters have been wasting their health in manufacturing, and I enjoy these things and demand them. We are all brethren, yet I live by working in a bank, or mercantile house, or shop at making all goods dearest for my brethren. We are all brethren, but I live on a salary paid me for prosecuting, judging and condemning the thief or the prostitute whose existence the whole tenor of my life tends to bring about and whom I know ought not to be punished but reformed. We are all brethren, but I live on a salary I gain by collecting taxes from needy laborers to be spent on the luxuries of the rich and idle. We are all brethren, but I take a stipend for preaching a false Christian religion, which I do not myself believe in and which only serves to hinder men from understanding true Christianity. I take a stipend as priest or bishop for deceiving men in the matter of the greatest importance to them. We are all brethren, but I will not give the poor the benefit of my educational, medical or literary labors except for money. We are all brethren, yet I take a salary for being ready to commit murder, for teaching men

to murder, or making firearms, powders or fortifications.

"The whole life of the upper classes is a constant inconsistency," and consequently "their whole life and all their enjoyments are embittered by the stings of conscience or by terror."

"THE FUTURE OF CALVINISM."

THE place of honor in the *Presbyterian and Reformed Review* is assigned to a vigorous and glowing essay by Dr. Bavinck, of the Reformed Church of the Netherlands, on "The Future of Calvinism." He describes as the root principle of Calvinism the confession of the sovereignty of God—"not one special attribute of God, for instance, His love or justice, His holiness or equity, but God Himself as such in the unity of all His attributes, and the perfection of His entire being." After tracing historically how Calvinism fosters morals, political freedom, social progress, he roundly affirms that "the Dutch will either be Calvinistic or will cease to be a Christian nation." "Calvinism is sufficiently pliant and flexible to appreciate and appropriate what is good in our age," "wishes no cessation of progress, and promotes multiformity," and "even in the Papal Church it has recognized the *religio et ecclesia Christiana*." Rarely nowadays does one come across a eulogy on Calvinism so wide-viewed, cultured and sanguine as this.

SAYINGS OF JESUS NOT IN THE GOSPELS.

MR. W. LOCK reviews in the *Expositor* for January Resch's critical collection of the "Agrapha," or sayings of Jesus not found in the Gospels, but found with greater or less degree of evidence in other early Christian documents. A few of these ancient pearls may here be strung:

"He that is near Me is near the fire: he that is far from Me is far from the Kingdom.

"That which is weak shall be saved by that which is strong.

"My mystery is for Me and for those that are Mine.

"Beholding one working on the Sabbath, He said unto him, Man, if thou knowest what thou doest, blessed art thou; but if thou knowest not, accursed art thou, and a transgressor of the law.

"When the two shall be one, and the outside as the inside, and the male with the female, neither male nor female—these things if ye do, the kingdom of My Father shall come.

"In whatsoever state I find you, in that I will also judge you.

"Prove yourselves trustworthy money-changers."

Other ancient sayings, not directly, or not in Resch's judgment correctly, ascribed to Jesus, are:

"Thou hast seen thy brother, thou hast seen thy Lord.

"Never be joyful, save when you look upon your brother's countenance in love.

"He who wonders shall reign, and he who reigns shall find rest.

"Blessed are they that mourn for the loss of unbelievers.

"Blessed is he who also fasts that he may feed the poor.

"If the neighbor of an elect man sin, the elect sinned himself [ascribed to Matthias the Apostle]."

THE THEATRES OF OUR ANCESTORS.

IN the *Revue des Deux Mondes* of December 15 M. Jusserand, the well-known authority on Mediæval England, describes the theatre of our ancestors and how they went to the play. The great object of early English dramatists and actors was to make their audiences laugh; and gesture was thought highly of, both in places of amusement and in church; for the very preachers, we are told, essayed to express their thoughts more clearly by imitating the groans and cries of those martyrs whose deaths they were describing, or, more pleasant task, to emulate the expression of those dying holy deaths. The people, observes one historian, when going to church, thought they were going to the theatre; instead of thinking of their prayers, occupied themselves with looking at the antics of the preacher.

The Irish wake seems to have had many a predecessor in "Merrie England." Extraordinary scenes used to go on in the churchyards both before and after a body was laid to rest. The Bishop of Winchester had to issue an order forbidding "dishonest games in the cemeteries, especially on high days and holydays." Both in villages and cities there was a craze for pageants; a death, a wedding, a departure for the Holy Land, was made an excuse for bringing out the finest clothes and uniforms and organizing a procession, of which giants, dwarfs, gilded animals and flower-bedecked cars formed part. As all the world knows, the first plays ever enacted were miracle plays; they took place during four great Church feasts of the year, especially at Christmas and at Easter. In Chaucer's time these "mysteries" were immensely popular, and there is constant allusion to them in the "Canterbury Tales." For centuries every drama was composed from some incident in the Bible or in Church history, and each scene was laid either in Rome or in Palestine, with the exception of the Garden of Eden, for Adam and Eve, the serpent and the angel, were very popular *dramatis personæ*. It was during the fourteenth century that a fresh kind of play began to take the place of the religious drama; styled "moralities," these comedies were still supposed to have some good end in view, and, as befitted their title, each dialogue had a moral tucked away in the tail of it. Yet the miracle play did not cease to exist in Europe till much later. William Shakespeare was already fifteen years of age when the Archbishop of York forbade the further performance of the "mysteries," which had at one time made the town so famous; and Molière had already been dead three years when religious dramas were forbidden in France by order of the king, Louis XIV.

THE ACTOR AND HIS ROLE.

IN the series of articles on men's occupations which *Scribner's* is publishing Mr. John Drew writes in the January number of *The Actor*. He tells many funny and pathetic reminiscences of the knights of the board on the road and behind the footlights, and speaks most feelingly of the sensations which "the profession" endure in the process of mastering their parts:

THE REAL LIFE OF THE PLAYER.

"In the study and preparation of a part what a myriad of sensations and emotions the actor goes through; what elation and depression, what exaltation and despair he experiences between the inception of a rôle and its delivery to his public! at the first reading of the play and his trying to 'see himself' in the part he is cast for, or at the rereading of the part when he has it in manuscript form. The emotion is only different in degree, as the part may be a small one or a great one. After committing it to memory (the very smallest portion of the study of a part) comes the *real study* of it, the shaping and composing it, making himself, his personality and perhaps his peculiarities, if he have them, consonant with the rôle and fitting himself into the part so that he shall be what the author designed—now elaborating and then repressing and curtailing, accepting or rejecting mental suggestions, and making from an adumbration a perfect picture—in short, going through all the travail of *making* a part. For, with all credit to the author who gives him the character, it is the actor who makes it animate. *That* is the real life of the actor away from the footlights, where his emotions and sensibilities are brought into play.

HIS PART IS ALWAYS WITH HIM.

"When the part he has struggled and fought with, cajoled and anathematized by turns during the study of it, is presented to his public, it is then complete and a finished thing with the rest of the play. But what days and nights has he had before that *première*! From the beginning of the study of a part (and the feeling is more tense the more important that part may be) until the playing of it the actor and the character he is studying are never apart. It is always with him. It is his first thought on arising, it bathes with him, breakfasts with him, goes about with him during the day, obtrudes itself into the conversation when he is talking with friends, is most manifest when his real relaxation comes—between the end of his performance and retiring—and finally goes to bed with him! Nor is it laid then, for 'horrid dreams abuse the curtained sleeper.' I believe it is almost universal in the dreams of actors about stage affairs that the very wrong thing is always happening, and it generally takes the form of lack of completeness of raiment; some most important vestment is always missing when their 'call' comes for the stage. If it be a Roman tragedy the fleshings (the flesh-colored tights) are wanting. If it be an eighteenth century play the powdered wig is not to be found, or if a modern play a coat or waistcoat or some equally

necessary garment is undiscoverable; and during the agony of search awakening comes, and with it the relief and realization that it is but a dream. Psychologists must explain the cause of this phenomenon—we have never been able to determine it! But just so the actor dreams of his new part."

"PIN-WELLS AND RAG-BUSHES."

TO drop a pin into an ancient well and at the same moment to "wish a wish for something"—what man or woman not condemned in early life to close confinement amid city streets has not gone through this process, and even half-believed that by some mysterious influence of pin and well the wish would be fulfilled? Probably there are few who cannot recall some such fooling from the far background. But there are certainly much fewer who know anything of the world-wide kinship of primitive religion with which that simple act connected them. In the current number of *Folk Lore*, Mr. E. Sidney Hartland explores the subject. He thus sums up his investigations into the facts connected with "pin-wells and rag-bushes: "

CURIOUS SURVIVAL OF PRIMITIVE WORSHIP.

"We find widely spread in Europe the practice of throwing pins into sacred wells, or sticking pins or nails into sacred images or trees, or into the wall of a temple, or floor of a church, and—sometimes accompanying this, more usually alone—a practice of tying rags or leaving portions of clothing upon a sacred tree or bush, or a tree or bush overhanging, or adjacent to, a sacred well, or of depositing them in or about the well. The object of this rite is generally the attainment of some wish, or the granting of some prayer, as for a husband, or for recovery from sickness. In the Roman instance it was a solemn religious act to which (in historical times at least) no definite meaning seems to have been attached; and the last semblance of a religious character has vanished from the analogous performances at Angers and Vienna. In Asia we have the corresponding customs of writing the name on the walls of a temple, suspending some apparently trivial article upon the boughs of a sacred tree, flinging pellets of chewed paper or stones at sacred images and cairns, and attaching rags, writings and other things to the temples. On the Congo the practice is that of driving a nail into an idol, in the Breton manner. It cannot be doubted that the purpose and origin of all these customs are identical, and that an explanation of one will explain all."

AN INTERPRETATION.

After dismissing many plausible suggestions as inadequate, Mr. Hartland proceeds to give his own explanation: "I venture to submit, then, that the practices of throwing pins into wells, of tying rags on bushes and trees, of driving nails into trees and stocks, and the analogous practices throughout the Old World, are to be interpreted as acts of ceremonial union with the spirit identified with well, with tree, or stock. In course of time, as the real intention of the rite has been forgotten, it has been resorted to

(notably in Christian countries) chiefly for the cure of diseases, and the meaning has been overlaid by the idea of the transfer of the disease. This idea belongs to the same category as that of the union by means of the nail or the rag with divinity, but apparently to a somewhat later stratum of thought." So the crooked pin that falls to the bottom of the well is a hook that links the boy or girl watching it with the perennial and ubiquitous quest of humanity after unity with the Divine!

MATABELE IDEAS OF THE SPIRIT WORLD.

REV. D. CARNEGIE, who has just published a work entitled "Among the Matabeles," tells in the *Sunday at Home* some interesting facts about their faith and morals. "According to their moral standard, which is low and selfish in the extreme, they believe in right and wrong, in a future state and in rewards and punishments. It is often said by them that there are good and bad white men and good and bad black men. Their language contains many words expressive of right and wrong, good and evil, approval for doing good and punishment for wrongdoing. When a good man dies, according to their idea of goodness, all his relatives and friends come together to cry for him—that is, bewail his death. Every one, man and woman and child, come out of their huts, stamp up and down their yards, wailing and yelling at the pitch of their voice. It is a heart-rending sight, which once seen can never be forgotten.

THE STATE AFTER DEATH.

After death the spirit enters an ox, a snake, a buffalo or some other wild animal. Talking with the chief one day on this subject, he said that bad men had their abode in the spirit world right away in the forest in a lonely wilderness, far removed from all people, while those whom they thought good were called back by their wailing and singing relatives at the time of death, to live in and around their former dwelling.

"If a man is kicked or horned by an ox or a wild animal, it is the spirit of one of his relatives who had a grudge against him on earth, and now pays him back for some old score or other. In the royal circle a fixed number of pure black oxen are set apart as retaining the spirits of their ancestors, and on this account they are never slaughtered, the number being replenished when any old ones die."

Mr. Carnegie observes that sacrifices are offered to the spirits of deceased kindred, but for any one to pray to an idol of wood or stone is not known in the land.

AN anonymous article on the cannons used on French warships appears in the *Nouvelle Revue*. The writer is evidently in favor of small rather than large cannon, for they are less seen by the enemy, and if damaged can be more quickly replaced. The constant invention of new explosives makes the art of defense far more important than that of attack, but he points out that every new French warship built boasts of many improvements on those considered perfectly equipped a few years back.

THE ALTRURIAN IN CENTRAL PARK.

MR. HOWELLS makes his January report of the Altrurian through the *Cosmopolitan* as coming from that unusually edifying visitor after seeing our own Central Park.

A BIT OF ALTRURIA EVEN IN OUR MIDST.

Says Mr. "A. Homos," who is far more prone to say true things about us and our *mores* than complimentary ones :

"In the absence of the private interest here I get back again to the fair city and the yet fairer cities of our own Altruria, and I hope that if you cannot quite excuse my self-indulgence in placing myself near the park you will at least be able to account for it. You must remember the perpetual homesickness gnawing at my heart, and you must realize how doubly strange an Altrurian finds himself in any country of the plutocratic world ; and then I think you will understand why I spend, and even waste, so much of my time lingering in this lovely place. As I turn from my page and look out upon it I see the domes and spires of its foliage beginning to feel the autumn and taking on those wonderful sunset tints of the American year in its decline ; when I stray through its pleasant paths I feel the pathos of the tender October air ; but, better than these sensuous delights in everything of it and in it, I imagine a prophecy of the truer state which I believe America is destined yet to see established. It cannot be that the countless thousands who continually visit it and share equally in its beauty can all come away insensible of the meaning of it ; here and there some one must ask himself and then ask others why the whole of life should not be as generous and as just as this part of it ; why he should not have a country as palpably his own as the Central Park is, where his ownership excludes the ownership of no other."

WHY WE IMITATE EUROPEAN MANNERS.

The Altrurian might have been expected to take exception, in praising our park, to the jangling harness on the proudly stepping horses which draw the great landaus with their studiously *blasé* owners and carefully modeled flunkies. Not that our aping of the old country equipages is not conducted often with good taste.

"The bad taste is in the wish to imitate Europe at all, but with the abundance of money the imitation is simply inevitable. As I have told you before, and I cannot insist too much upon the fact, there is no American life for wealth ; there is no native formula for the expression of social superiority, because America, like Altruria, means equality if it means anything in the last analysis. But without economic equality there can be no social equality, and, finally, there can be no political equality, for money corrupts the franchise, the legislature and the judiciary here, just as it used to do with us in the old days before the evolution. Of all the American fatuities none seems to me more deplorable than the pretension that with their conditions it can ever be otherwise, or that simple manhood can assert itself successfully in the face

of such power as money wields over the very soul of man. At best the common man can only break from time to time into insolent defiance, pending his chance to make himself an uncommon man with money. In all this show here on the park driveways you get no effect so vivid as the effect of sterility in that liberty without equality which seems to satisfy the Americans. A man may come into the park with any sort of vehicle, so that it is not for the carriage of merchandise, and he is free to spoil what might be a fine effect with the intrusion of whatever squalor of turnout he will. He has as much right there as any one, but the right to be shabby in the presence of people who are fine is not one that we should envy him."

THE VANISHING MOOSE.

IN the January *Century* Madison Grant has a pleasant "big game" article on "The Vanishing Moose," in which he tells of the hegira of that forest monarch from the North Woods. While the Adirondacks were a favorite retreat of the great deer in the time of the Pathfinder, he is never seen there now, the last one having been killed on Racquette Lake in 1861. They have gone silently and sadly to the north, and advancing civilization still continues to hem them in closer and closer. From the interesting things Mr. Grant has to tell about our noblest game animal, we quote the following paragraphs :

A FIERCE WARRIOR.

"The battles between the bulls—the only occasion when their huge antlers come into use—are described as being simply terrific, and often result in the death of one or both of the combatants. The double fenders or brow-antlers do the most damage, although the whole horn, so massive and firmly supported by the stout neck, deals fearful blows. The shock between two of these animals can safely be left to the imagination, for a large bull usually weighs about 1,000 pounds, and they are sometimes killed weighing from 1,200 to 1,500 pounds, which is about the limit. Cases, however, apparently authentic, have been reported when 2,000 pounds have been claimed. The great difficulty is to find anywhere near their haunts scales which can weigh so huge an animal, for if gralloched and carted out, much of the original weight is lost.

"They begin their battles early in life, for a four-year-old bull, shot last autumn on the Ottawa, when skinned showed on one side a fresh wound with a shattered rib beneath it, and on the other, the scars of an old wound where another rib had been broken the year before. His latest combat had evidently been successful, for when shot he had two cows with him as proof of triumph. Whether in his maiden battle of the year before he had been victorious over his rival it would be interesting to know, for he was a brave brute, who met his death from pure love of a fight. Hearing the approach of hunters, and probably thinking the noise came from another bull, he turned back to defend his charge, freshly wounded as he was, and deliberately stalked up to within thirty yards of his enemy, only to fall with a bullet below his ear.

"Early in September, before they are mated, in a good moose country it is no uncommon thing to hear their challenging calls, which sound precisely like a man chopping, and their combats are of daily, or rather nightly, occurrence. Indian hunters say that when they hear in the twilight the breaking of the undergrowth and the crash of antlers in one of these mighty battles, they slip up close and shoot the cow as she stands placidly at one side watching the result with languid interest. When she falls the bulls fight on with redoubled fury, and so intent are they on the duel that both can be killed with ease. If, however, a bull is shot first, the survivors take to the bush at the report. As in the case of battles between deer or elk, the horns are said sometimes to become so interlocked that they cannot be pulled apart, and both animals perish miserably. From the structure of the horns, however, this must be a very rare event, but a pair of interlocked horns were found in Oxford County, Maine, about 1845."

HIS HORNED GLORY.

The moose's antlers vary with his condition, being smallest after a hard winter and most luxuriant when he is in prosperous quarters. "A large pair measures from three to four feet from tip to tip. Now and then a pair will exceed five feet. One killed in 1881 measured five feet six inches from the extreme points. Mr. Albert Bierstadt, the artist, is in possession of an immense pair of moose antlers, measuring five feet five inches at the widest point. The webbing is remarkably wide. A gentleman of Mattawa, Ontario, has a pair which measures five feet eleven inches from tip to tip. This seems to be the limit. An interesting theory has been advanced to account for the palmaria of the horns: that being placed below and behind the ears, they act as a sounding board and give the animal his great quickness of hearing.

"The height of the moose at the withers is a source of much dispute, and this variation largely grows out of the different ways of measuring one as he lies on the ground. An ordinary bull stands fully six feet, and a very large one seven feet at the shoulders. There are many authenticated cases where they ran as high as seven feet two inches and seven feet four inches. In October, 1880, George Ross killed in Muskoka a moose which, when carefully measured by several persons, stood eight feet two inches at the shoulders! His antlers alone weighed eighty-four pounds! This seems beyond the possible limits, but gigantic moose do occur, especially in this part of Canada. Indian legends abound in stories of moose of fabulous size. The Sioux Indians believed in a monstrous moose which could stride with ease through eight feet of snow, and which no single hunter dared attack. Alaska and Rupert's Land furnish material for similar tales. At all events, the moose is the largest quadruped on our continent, and with his strength and swiftness has only man to dread, as the bear lacks both the courage and agility necessary, and the wolf or panther would scarcely dare to attack any but a very young calf."

AN HISTORIC LAND MARK.

WHO has not read in the old school readers the legend of Starved Rock, that famous old landmark which stands guard on the Illinois River a few miles below the town of Ottawa? In the shadow of this rock the chiefs and warriors of various Indian tribes were wont to meet in council, and there in 1673 Pere Marquette and Joliet introduced Christianity among the Illinois tribes. Upon the rock as early as 1682 La Salle built the fort around which gathered the first colony in the Mississippi Valley.

A WATCH TOWER, COLD, GRIM, DEFIANT.

Its peculiar surroundings gave it a position unique and distinctive in the early Western explorations. Rev. Frank J. O'Reilly, writing in the *Catholic World*, gives the following description of the rock: "A natural fortress, like some impregnable castle overlooking the Rhine, sullen and perpendicular it rises from the water's edge. A deep chasm separates it from the neighboring cliffs on the east. The view from the valley, showing three sides of gray sandstone, suggests a watch tower, cold, grim, defiant. To-day its summit is covered by occasional tufts of grass, straggling wild flowers, growth of cedar, with just a hint of ivy creeping over the edges as if to preserve it from the blasts, which seemingly, however, have made no impression upon it. Stands it conscious of the distinction, one thinks, of being the most picturesque, the most romantic, and the most historic spot in the explorations of the mighty West."

THE LAST OF THE ILLINOIS.

The story of the bitter fight between the Ottawa and Illinois tribes in 1769, ending in the extermination of the Illinois by starvation on this rock, thus giving it its name, is described as follows by Mr. O'Reilly: "In a passionate moment, Kinneboo, chief of the Illinois Indians, stabbed Pontiac. The chief of the Ottawas was a man whose strong personality made him a leader, not merely among his own tribe but of all who yearned for a guiding force. History rightfully calls him the greatest of the North American Indians. Over his dead body vengeance was vowed. War, not of conquest but unto extermination, was declared. The Miamis, Kickapoos, Shawnees, Chippewas, and remnant tribes which had fought under Pontiac came forward to avenge his death. The villages of the Illinois were destroyed, their property carried off. La Vantum alone remained. Within it were gathered ten thousand souls, a fifth of whom being warriors. Throwing up fortifications on three sides, the river protecting them in the rear, the Illinois now made their last stand in defense of home. Thus passed the summer. The early autumn grew apace, when in the midst of festivities—the result of seeming security—the united enemy suddenly bore down upon them. A hand-to-hand conflict ensued; those who scaled the new-made fortifications fell within the breastworks. Seeing the fate of their companions in arms, the avengers of Pontiac retreated to Buffalo Rock. Repulsion served to madden them the

more; eagerly awaiting the dawn, they renewed the battle. For twelve hours furiously on went the contest. Night gathered to witness its continuance, till at length, interrupted by a blinding storm, the Illinois, quickly launching their canoes, crossed the river and ascended the rock where Tonti with his hundred and fifty followers had once put to flight two thousand Iroquois warriors. History, sad to relate, was not destined to repeat itself. True, like Schamyl on Ghunib's height, ninety years later, they looked serenely down upon the enemy. But what traitors or new found paths could not do, hunger and thirst wrought. Twelve days of siege sufficed to witness the twelve hundred souls who climbed the rock die of famine. Rather than yield they nursed hunger and thirst. Mindful of this steadfast deed, even if in savage warfare, thoughtful sentiment has journeyed to the scene and written clear and large the words: Starved Rock."

THE MEMORY OF MEN AND ANIMALS.

M. BLANCHARD recounts, in the *Nouvelle Revue* of December 15, some curious observations on the memory of both men and animals. He has noticed that not only domestic animals always develop a keen sense of time and place when to do so affects their own life or comfort, but that birds will recollect over years where they once built their nests and were in the habit of receiving food. Those birds which can be taught to talk and sing never forget the phrase they learned when young, but as they grow older it has been found almost impossible to make them repeat a new word or tune. Among the ancients, Mithridates was noted for his extraordinary command of languages, and it was said that he knew every soldier in his army by his name, and the same legend was current about Julius Cæsar. In more modern times Frederick the Great's librarian, a certain Lacroze, possessed the same faculty. On one occasion he recited before Leibnitz twelve verses in eleven different languages, and which he only heard repeated once. When he was asked where a given subject was treated, he would cite not only the book, but the page and even the line, and in addition to knowing every European language, Latin, Greek and Hebrew, to please Leibnitz he added Chinese to his other accomplishments. M. Blanchard points out that an extraordinary memory does not necessarily imply a great intellect. Cardinal Mezzofanti, who knew seventy-eight languages, and could learn a new dialect in about ten days, was in no way remarkable either as a churchman or as a man. But the greatest phenomenon of the kind ever known seems to have been a certain Verdet, who, born in Nîmes, 1824, came out first on the list of the pupils of L'Ecole Normale when only eighteen years of age. With him work was entirely a question of memory. He remembered, word for word, the most elaborate treatises on physics and chemistry, and that in two languages—French and German. A sense of memory may be awakened by touch, smell, sight, taste and hearing.

A THOUSAND MILES IN TWENTY HOURS.

IN the January *McClure's*, Mr. Cy Warman, locomotive engineer and poet, makes a graphic chapter indeed of his ride from New York to Chicago in the cab of an "Exposition Flyer" engine. He tells us that every slightest operation in the cab of one of the great "thunder birds" has its effect in making or marring the swift run on schedule time, and he knows at sight all the peculiarities of and individual virtues and weaknesses of the giant, life-like engine. It is pretty to see how clearly the old engineer looks on his charge as something human.

"We are now fifty minues out; the throttle is closed. A half mile ahead is the water trough. When the engine reaches it the fireman drops a spout, and in thirty seconds the big track trough is dry. When the tank is filled the throttle is opened, the fireman returns to his place at the furnace door, and in a few minutes we are sailing along the line as fast as before. The black smoke curling gracefully above the splendid train reminds me of what Meredith said of his sweetheart:

' Her flowing tresses blown behind
Her shoulders in the merry wind.'

"We have lost a minute or a minute and a half taking water, and now we are nearing a bad bridge—a bridge under repair, and over which the engineer has been instructed by a bulletin posted in the round house at New York to pass at ten miles an hour. We are three minutes late when again we get them swinging round the curves beyond the bridge."

The mighty train makes sometimes fifty-five, sixty, sixty-five, even seventy-five miles an hour, as successive engines and grades allow. Says the "Deadhead," as Mr. Warman terms himself, riding in the cab:

"If I am at all uneasy it is only when turning the slightly reversed curves where the way changes from a two to a four track road, or back. Plain curves are all well enough. But it does not seem quite right to shoot her into those kinks at a mile a minute. Yet after I have seen her take two or three of these, I rather enjoy it. She sways to the right, to the left; then, with a smart shake of her head when she finds the tangent, she speeds away like the wind."

WHAT AN ENGINEER DOES IN DANGER.

"We are making a mile a minute. What would the driver do if he saw before him a burning bridge, or the red lights of a standing train? His left hand is on the throttle; he would close it. Almost in the same second his right hand would grasp the sand lever, and with his left he would apply the brakes. With both hands, in about the third second, he would reverse the engine. Perhaps he has heard that old story that to reverse a locomotive is to increase her speed—that a bird will fly faster with folded wings: he may pretend to believe it; but he will reverse her just the same. If she has room she will stop. Even without the aid of the air brake she will stop the train, if the rail holds out. I ought to say that, the instant he reverses the engine, he will kick the cylin-

der cocks open—otherwise he may blow off a steam-chest or a cylinder head."

A SUGGESTION OR TWO.

Mr. Warman gives *en route* a very interesting account of the running organization of a railroad, and makes some suggestions which, he thinks, if carried out, would lessen the danger of catastrophe. Men should not be allowed to drink on or off duty, as far as the authorities can determine. "A man who was drunk last night is not fit to run a train or engine to-day. Men who never drink should be encouraged, and promoted ahead of those who do. I have always opposed the idea of promoting men strictly in accordance with the length of time they have served in any capacity. If all firemen knew that they would be promoted when they had fired a certain number of years, there would be nothing to strive for. They would be about as ambitious as a herd of steers who are to be kept until they are three years old, and then shipped."

Then Mr. Warman deprecates the practice of the more energetic engineers of working overtime. They are paid by the day, but the day is so many miles run.

"One young man, Hyatt by name, used to threaten to put himself into a receiver's hands when he made less than forty days a month. Fifty days was fair business, but sixty suited him better. He kept it up for three years, collapsed, and had to be hurried out of the country. I don't know that he ever wholly recovered. He was a fine fellow physically, sober and strong, or he would have collapsed sooner. I am afraid the older engineers are a little selfish."

ART AND THE SINGLE TAX.

IN the January *Arena* Mr. Hamlin Garland argues after the lights which we have learned to know him by in his paper on "The Land Question and its Relation to Art and Literature." How he brings these at first sight dissimilar elements into conjunction may be seen from the following paragraphs:

"I love the past of the stage, but I believe in its future still more. Two sublime ideas are already entering the drama—truth and sympathy, and already there are signs that the novel will have side by side with it an equally true and equally human play. The stage will yet be the exponent of its sister art, fiction. I want every artist and writer able to be true to himself without regard to what has been done. I want him *free*! And this is why I am deep in the great land reform called the single tax. I believe it will free art as well as labor—for freeing labor will free everything. I love the cause of labor because of the value of freedom to the laborer, but I love and fight for this freedom because it is the whole battle that frees art, literature and science. In the fate of the wage earner is the fate of all."

THE STANDARD OF ART AND THE STANDARD OF LIVING.

"I think every true artist, because he is a loyal citizen, looks upon the struggle of life here in America with pitying eyes. Art cannot rise out of the weltering smother of our daily tumult. Our socialist

brethren would say, Blot out your 'competitive system.' But it is the lack of competition as a matter of strict fact. It is the war of the man who is disinherited with the man to whom government has granted special privileges to tax his fellows. But we are all agreed—all reformers—that the unrest and toil and brutalizing struggle to win standing room are making art false and insecure, are crippling the dramatist and starving out the poet and novelist. We differ only in our plans of social redemption.

"If you would raise the standard of art in America you must raise the standard of living—that is my first proposition. The comfort of the common American must be secured. He must have leisure and he must have means to buy to his taste. It is a physiological law that the tired, hungry man cares nothing for beauty. What does a sick man care for Millet's 'Angelus,' or for the view from Mount Washington? A Japanese fire-screen would be as impressive. What are the charms of parks, of landscape gardening to the poor tramp, haggard with hunger and desperate with need?"

THE HOPE OF THE ARTIST AND THE LABORER.

"The solution of the whole problem lies in freeing labor by breaking down monopoly in mines, forests, building lots and farms and opening wide to labor a thousand natural opportunities to employ itself. With twice as many jobs as men labor will demand and get its proper share of its product. The laborer under the single tax would have no tax upon his industry, no tax upon his home. He could make his own contract then and his fear of poverty would be gone.

"His prosperity would instantly react upon all art and all lines of legitimate business. Wages would go up in every branch of trade, while trade would be placed on a healthy and safe basis of corresponding activity. As Mr. Herne has indicated in his remarks, there can be no overproduction as long as men have opportunity to satisfy their reasonable wants. When men have enough to eat they turn to art and literature. There is no overproduction of theatres; there are not too many actors. The whole trouble, I repeat, lies in the inability of the farmer, the mechanic, the doctor, the teacher, the millions of common Americans, to gratify their taste for the stage. Remove this disability, increase the wages of these men, and instantly art and literature would feel the effect of the reaction of the mind of the common man to buoyancy and hope."

THE FUTURE IS WITH THE WORKINGMAN.

"O the brave future! when the mouth of hunger shall be filled, and every child be flushed with warmth. In the future we all hope for there is the most beautiful drama and the most human fiction. Men and women of the drama, your art is not supported by the few, after all; it rests upon the support of the many. Its fate is bound up with that of the workingman. You too must become reformers. You too must stand for equal rights, with all that the fearless leaders of present-day thought have made that phrase mean."

THE MISSION OF ISRAEL.

THERE are some fine paragraphs in an unsigned article in the January *Harper's* on "The Mission of the Jews." The writer deals strongly with the marvelous contradictory elements in the fate of Israel—their spiritual insulation and immobility and their actual dispersion over the face of the earth—and sees two distinct missions which the chosen people have upon them.

THE VIRTUES OF THE CHOSEN PEOPLE.

The one is an individual mission to the world :

"Still, let him cling to the good that has come from the predominance of the spiritual over the sensuous elements in his life and teaching, especially in his opposition to the sensual vices, which (in spite of any individual instance which may be adduced to the contrary) he has kept up in all periods of his history. Let him hand on the torch of purity and temperance, which have been two of the chief causes of his wonderful survival during all this period of adversity, and of his great success in the walks of life, as well as the ultimate cause of much of the hatred and envy which are showered upon him. This spirituality, strengthened by a continuous persecution from without, has also caused him to turn his affections in an intensified form towards the inner life of his family ; and this piety and devotion of the members of a family to one another, which has clung to the Jew to whatever depths of degradation circumstances may have dragged him, is one of the features which, with the dissolution of his formal exclusiveness, he must ever keep alive, hand down, and be the means of diffusing among the community into which his racial life will dissolve itself.

"This is the mission of the Jews in so far as each Jew can act individually upon his surroundings. But there is a mission which, to use a paradoxical phrase, the Jews have collectively as a dispersed race. It is the vocation of the Jews to facilitate international humanitarianism ; and this they will do and are doing, not by any doctrinaire effort of individual theorists or preachers, but by their position of a dispersed people, which has, and is bound to have, influence."

THE UNION OF HELLENISM AND HEBRAISM.

"As far as outer conditions are concerned, the Jews are nearest to realizing the future ideal of man : the greatest scope of individual freedom with the most intense social feeling and organization. He has, on the one hand, the intense love of family, and, on the other, the history of his people presents to him the feeling of a dispersion over the earth. Joining the spirit of these two facts together, he can thus solve the problem which vexes many a thoughtful and conscientious citizen in our days—the difficulty of bringing into harmony the dictates of patriotism and the love of humanity. Now the fusing force which binds these two ideal factors together, which makes cosmopolitanism more and more a necessity, and which at the same time can direct the course of patriotism, is the Hellenic idea of culture and civilization. In making each home and each State the

most civilized and cultured, we necessarily, *de facto*, approach cosmopolitanism. This idea, whether the practical politician is conscious of it or not, is at present the highest touchstone—the ideal foundation of all our national and international policy."

THE SACRED TWELVE.

"THE patriarchal and apostolical number of twelve, as the proper and only admissible number for a jury trying cases according to the common law, has," says a writer in the *Green Bag*, "come down to us from remote antiquity. Coke thought that its origin was surrounded with abundance of mystery, and it seems clear that, as a 'legal number,' it is far older than the petty jury itself. Yet it was not always universal. In 1652 a Cornish custom to have juries of six was declared to be bad ; but evidence was given that such juries had been widely used in the county, and by a special statute of Henry VIII juries of six were allowed in Wales. The County Court jury of five is, of course, a very recent, and some think a very unfortunate, innovation, and the Court in which it sits is itself only fifty years old. But the jury of the grand assize consisted of sixteen men, which still finds a parallel in the jury of presentments of the Liberty of the Savoy. The modern grand jury, the coroner's jury, and the jury at lunacy and ecclesiastical inquisitions number anything between twelve and twenty-three, whereof twelve at least must agree on a verdict. So much for the law ; the practice is, at least according to common report, that where the jury consists of twelve only, one petty jurymen can get the plaintiff a verdict or acquit the prisoner, if only he is sufficiently obstinate, and if he have breakfasted with foresight and discretion."

THE MAIN POINTS IN AN ATHLETE.

SIR BENJAMIN WARD RICHARDSON furnishes the readers of *Longman's* with much sound advice concerning "the athletic life." He reckons the life to run from eighteen to thirty-six years of age, and strongly discountenances any attempt to extend these limits. He holds that all who are healthy can, under training, become athletes—women as well as men. The Greek school fully granted this of women ; but the Jewish teaching, which ruled later civilization, and "went against woman," discouraged the belief. He quotes from "a champion of the Thames"—a distinguished trainer—the four "essential characteristics of a sound athlete—precision, decision, presence of mind, endurance."

WHAT IS WILL?

He tells of a tight-rope expert who confessed that if anything would affect his presence of mind in the practice of his art, it would be the comments of the crowd, "and nothing so much as the cry of fear of a child."

This same tight-rope walker once rather bowled Sir Benjamin over by asking him, "What is will?" Ill

with lumbago, unable to stand or bend, he had "summoned up his will," forced himself to traverse the rope several times, once wheeling a barrow—according to engagement—only after his task to be carried back to bed "as stiff as a frozen frog," and he wanted the doctor "as a physiologist" to explain what will is. This and other facts led Sir Benjamin to put mental endurance before physical. He attributes Weston's wonderful success in his walking feats to "mental endurance," apart from which he was only "an ordinarily strong man of middle age."

ESSENTIALS IN TRAINING.

For training Sir Benjamin has four specifics: "Abstinence from hurtful things. Regular and good habits. Calmness of temper. Laudable ambition." He demands along with "all good trainers and all good competitors," as "absolutely necessary," abstinence from alcohol. He also forbids tobacco smoking. Gambling is "fatal to body as well as mind."

"Oatmeal porridge and eggs with toast make a good breakfast; a mutton chop or a beef steak, with a light quantity of vegetables and some fruit make an efficient dinner; and, avoiding tea, or exchanging that for a cup of milk, a dish of whole wheatmeal porridge for supper suffices. These, in my experience, form as good a diet rôle as can be devised for men in active athletic work." Three or four meals a day, four or three hours apart; seven hours' sleep; "early to bed and early to rise" are among the other things commended.

THE GREAT BELLS OF THE WORLD.

PROPOS of the great bell which will soon arrive in Paris from Russia, M. Bonnefont contributes to the *Nouvelle Revue* an interesting and curious history of the various great bells of the world. The Egyptians, we are told, invented the first bell, and it was only as late as 604 that they began to be used in the Roman basilicas, wherever they were quite small and insignificant in sound and weight. The largest bells in the world are in Russia: that of the Kremlin weighs half a million pounds. In France, Notre Dame can boast of one weighing thirty-five thousand pounds. The next most famous French bell is in the Cathedral at Rouen. Perhaps the most famous bell in Europe is that of Villeda, which is said to sound of itself when some misfortune threatens the kingdom of Spain. The first blessing of bells took place in 750. The best bells, observes M. Bonnefont, are composed of a mixture of copper and tin, and the hammer should weigh at least a twentieth part of the whole bell. The first chimes and peals came into being during the fifteenth century, and at once attained considerable popularity. Soon every town in Europe could boast of its peal of chimes, and the trade of bell-wringer was exceedingly profitable. In Turkey bells are held in less esteem; criminals who have been reprieved are obliged to wear a small bell suspended round their necks in order to warn passers-by what manner of men they are, and the same edict is in force as regards lepers.

WOMEN AND JEWELS IN SIAM.

THE *Leisure Hour* gives some interesting particulars about the present King of Siam—Chulalongkorn I. His palace is a walled city within a city. Inside the palace walls are never less than a thousand armed men, and since the troubles with France that number has been greatly increased. But to the innermost arcana of the palace no European man has ever penetrated.

In it are 4,000 women and one man. That man is the King. The jewels contained in this fairy palace are of fabulous worth. The first Queen possesses a huge safe, made by a London firm, filled with jewelry of untold value; the second Queen owns a scarcely inferior assortment, while the jewel repository of the King is said to occupy the entire space of the royal bed-chamber. Yet in spite of gems and *bijouterie*, the lot of woman in Siam is not a happy one. The poorer women "are the beasts of burden and the tillers of the soil, the hewers of wood and drawers of water. Their lazy husbands sleep while the wretched wives cultivate the paddy-fields." And as for the woman in the royal harem, her life is "a blank, which will end only with herself." "She does everything by rote, parrot-like. Her very children are taken from her at perhaps six years old, and the chances are much against her ever seeing them again. They are lost to her the same as she has been lost to her parents years ago."

YOUNG ENGLAND.

"YOUNG ENGLAND" begins a new volume with a new editor and some new features. The late Mr. Thomas Archer has been succeeded by Mr. Horace G. Groser, author of "Atlantis and Other Poems." Under the new *régime* all the qualities that have built up the reputation of the magazine are to be maintained, while something more definite and permanent in its results is also to be aimed at. The new editor addresses a spirited poem to English boys in the January number, in which he says:

Do you count it a little thing to be born with an English name—

To be heirs of a race that has climbed through a thousand years to fame?

* * * * *

Shall Duty be just the task that is under our eyes—no more?

Must we never straighten the back, and glance behind and before?

Is Duty the daily toil for one sole hearth and home,
Blind to all other claims and the lineage whence we come?
If Duty wait at the forge, or the loom, or the warehouse stool,

The larger thought will inspire each stroke of the pen or tool;

And the worker shall give his best, not alone for the wage it brings,

But lest the honor of England be lowered in little things—

By her craftsmen's niggard zeal or the greed of her merchant-kings.

SOME ARTICLES ABOUT FAMOUS MEN AND WOMEN.

HOW JULES VERNE LIVES AND WORKS.

THE "Conversation" which *McClure's* retails to us for the New Year month is with Jules Verne, who is "interlocuted" by R. H. Sherard. The latter makes a rather pathetic picture of M. Verne's attitude toward his contemporary world and his sad assertion that "I do not count in French literature." But though that is a cloud over his work and though his pecuniary rewards have been strangely small for so popular and so prolific a writer, the author of "Michael Strogoff" is not by any means an embittered old man.

JULES VERNE.

"Sixty-six, and but for his limp still hale and hearty, with much in his face that reminds one of Victor Hugo; like a fine old sea captain, ruddy of face and full of life. One eyelid slightly droops, but the gaze is firm and clear, and from his whole person emanates an aroma of goodness and kindness of heart which have ever been the characteristics of the man of whom Hector Malot, writing many years ago, said: 'He is the best of best fellows;' of the man whom the frigid and reserved Alexandre Dumas loves like a brother, and who has not and never has had, in spite of his brilliant success, a single real enemy. His health troubles him, unfortunately. Of late his eyes have weakened, so that at times he is unable to guide his pen, and there are days when gastralgia martyrizes him. But he is as valiant as ever. "'I have written sixty-six volumes,' he said, 'and if God grants me life, I shall finish eighty.'"

"Jules Verne lives on the Boulevard Longueville,

at Amiens, at the corner of the Rue Charles Dubois, in a fine, spacious house, which he rents.

THE HOME OF A NOVELIST.

"When one has rung at the little side entrance and, in response to a great peal, the door has been opened, one finds himself in a paved courtyard. Opposite are the kitchen and offices; to the left may be seen a pleasant garden, well stocked with trees; and to the right is the house, to which a row of broad steps extending the whole length of the façade leads up. A conservatory filled with flowers and palms forms the entrance room, and passing through this the visitor enters the drawing room. This is a richly furnished room, with marbles and bronzes, warm, rich hangings, and the most comfortable of easy chairs—the room of a man of means and leisure, but without any characteristic feature about it. It looks like a room which is little used, and this is the fact. Both Monsieur and Madame Verne are very simple people, who care nothing for show, and all for quiet and comfort. The adjoining large dining room is rarely used, except when dinner parties are given or a family *fête* is held, and the novelist and his wife take their simple meals in a little breakfast room which adjoins the kitchen. From the courtyard the visitor notices in the far corner of the house a lofty tower. The winding staircase which leads to the upper stories is in this tower, and at the very top of the staircase is M. Verne's private domain. A passage, carpeted with red stuff like the staircase, leads past maps and charts to a little corner room, which is furnished with a plain camp bedstead. Against a bay window stands a small table, on which manuscript paper very neatly cut may be seen. On the mantelpiece of the tiny fireplace stand two statuettes, one of Molière and the other of Shakespeare, and above them hangs a water-color painting representing a yacht steaming into the Bay of Naples. It is in this room that Verne works. Adjoining it is a large room with well-filled bookcases reaching from ceiling to carpet.

HOW TO WRITE EIGHTY NOVELS.

"Speaking about his methods of work, M. Verne said: 'I rise every morning before five—a little later, perhaps, in the winter—and at five am at my desk, remaining at work till eleven. I work very slowly and with the greatest care, writing and rewriting until each sentence takes the form that I desire. I have always at least ten novels in my head in advance, subjects and plots thought out, so that, you see, if I am spared, I shall have no difficulty in completing the eighty novels which I spoke of. But it is over my proofs that I spend most time. I am never satisfied with less than seven or eight proofs, and correct and correct again, until it may be safely said the last proof bears hardly any traces of the original manuscript. This means a great sacrifice of pocket, as well as of time, but I have always tried my best

for form and style, though people have never done me justice in this respect.'

"We sat together in the room of the Société Industrielle. On one side of M. Verne was a pile of proofs, 'the sixth set,' he said, and on the other a long manuscript, which I had looked at with interest, 'but which,' said the novelist, with his genial smile, 'is merely a report which I am addressing to the municipal council of Amiens, of which I am a member. I take great interest in the affairs of the town.'"

HOW RIDER HAGGARD WORKS.

MR. FRED DOLMAN contributes "An Interview with Mr. H. Rider Haggard" to the *Young Man*. The novelist, it appears, loves a country life. He found that his life in London "meant much dining out, bad digestion, late hours and very little work, besides confinement and scarcely any outdoor life." Saved as a youth from a clerkship in the Foreign Office by "official appointment in the Transvaal," he proposed on returning to England to turn

H. RIDER HAGGARD.

barrister. Until his "King Solomon's Mines" brought him fame and fortune, he merely thought of literary work as filling up his time while preparing for the Bar. He thus confided to the interviewer his method of work:

"You notice that I have two tables for writing. I

use both alternately, as I like to have a change of position. When I have written my novel on foolscap, I engage a type writer, and dictate it to him, making any necessary corrections as I go along. This plan saves me much trouble with the proofs.'

"You write very quickly, I believe?"

"Yes, at fever heat, as a rule. "She" was written in six weeks, and in point of sale is my most successful book, the number sold having now exceeded that of "King Solomon's Mines."

"Most of my work," Mr. Haggard continues, "is done in the winter, in the afternoon and evening. In the summer time I like to enjoy the country, and every morning the farm claims my attention. Each of my recent books has occupied me for about six months.'

"When I am at work on a book," Mr. Haggard tells me, "I generally write three or four thousand words a day, working, as I have said, in the afternoon and evening. When once I have started on a new book, I am in a state of unrest until it is finished."

Mr. Dolman gives this glimpse of the home life:

"Every morning before breakfast the whole household assembles in the hall for family prayers. Mrs. Haggard and her two little girls, the half-dozen servants and any visitors who may be staying in the house, take their seats in the high-backed chairs, while Mr. Haggard reads a chapter from the old family Bible which always stands on a large table, and afterwards offers a short prayer."

OLIVE SCHREINER AS FELLOW-TRAVELER.

"A VOYAGE with Olive Schreiner" from Cape Town to Portsmouth (England) is narrated by Rev. R. E. Welsh in the *Young Woman*. He remarks on the strange differences of development in the Schreiner family. The father was a missionary. The mother is now in a Roman Catholic convent. A sister, Mrs. Lewis, and Mr. Theodore Schreiner, Q.C., are "aggressive Christians and red-hot temperance advocates;" another brother is a Churchman and schoolmaster at Eastbourne. The authoress of "The African Farm" impressed Mr. Welsh as "the bravest of women and as bright as brave."

"Her features are clean-cut and strong, her figure below the average height, her eyes as deep as dark Derwentwater, and capable of storm as well as love. Her voice is buoyant and clear; her face as open as a child's, and as swift in its responsive expression of light and shade, yet marked by reserves of strength and will force. You find in her none of the marks of literary pedantry. . . . She meets you more than half-way in conversation. She draws you out to your best and truest, and is ready to join you whether upon the ground of woman's world, the pleasures of England, or the deep things of Buddha—but you must not rashly refer to her own writings, especially to her African Farm. Children most of all she loves."

HER RELIGIOUS VIEWS.

She cannot, it appears, write in London: "It is her beloved Karroo that is charged for her mind with

inspiration. . . . She can tell you how as a young girl she used to look on the very weeds and feel intensely that she was one with them, and that she and they were all interfused with the same universal soul.

OLIVE SCHREINER.

"She has a Buddha's pity and love for lone man—and many of Buddha's points of view. Her spirit, also, is largely Christian. I happen to know how deep is her veneration for the Son of Man, though she cannot accept the Church's terms about Him. . . . While I make no pretence to have had Miss Schreiner's secret mind disclosed to me, I venture to think that, since the day when the "African Farm" came from her indignant heart, she has softened both towards God and faith. Browning, I found to my delight, is her master-poet. . . . She is radiant with the outshining of unselfish love. During the voyage her heart was not with the first but with the third class passengers."

Mr. Welsh quotes from a "letter from one of her own blood:" "It is always sweet to me to turn from acrid, censorious strictures to Olive's life-long services of love, her Christ-like consolation of the poor and suffering. Human need of all kinds appeals at once to her deepest feeling, and, like our dear Lord, she is 'touched with compassion.'"

BRET HARTE'S FIRST BOOK.

A CHARACTERISTIC paper by Mr. Bret Harte in the *Idler* begins by declaring that his "first book" was not his own. "In priority of publication, the first book for which I became responsible, and which probably provoked more criticism than anything I have written since, was a small compilation of Californian poems indited by other hands."

A bookseller of San Francisco asked him to select and edit a volume of poems from those which had already appeared in local newspapers and magazines. The news having got abroad of the forthcoming "compilation of Californian verse," the unfortunate young editor was deluged with newspaper and, finally, manuscript "poetry."

"Some of the names appended to them astonished me. Grave, practical business men, sage financiers, fierce speculators and plodding traders, never before suspected of poetry, or even correct prose, were among the contributors." Even a judge handed over—pompously and patronizingly, of course—his metrical effusions. Appalled by the quantity and dismayed by the quality of the verse sent in, the selector at last succeeded in reducing the volume to the requisite bulk.

BRET HARTE.

The chief fun of the sketch is the reproduction of the first "criticisms of the press." Each newspaper whose pet poet had not been sufficiently honored in the selection "went for" the luckless editor in the most choice and direct Californian English. "Lop-eared Eastern apprentice;" "imported greenhorn;"

"complacent editorial jackass;" "serene ass," were a few of the flattering epithets showered upon him; and the "verse" was labelled variously "hog-wash," "flapdoodle mixture," "slumgullion," etc.

The results of the journalistic cannonade were highly satisfactory: "The book sold tremendously on account of this abuse, but I am afraid that the public was disappointed. . . . The editor, who was for two months the most abused man on the Pacific slope, within the year became the editor of its first successful magazine. Even the publisher prospered, and died respected."

The writer is careful to give this "grain of salt:" "Where I have been obliged to quote the criticisms from memory, I have, I believe, only softened their asperity."

"AMONG THE FJORDS WITH EDVARD GRIEG."

"**A**MONG the Fjords with Edvard Grieg" is the title of an interesting little contribution to the *Woman at Home* for January, by the Rev. W. A. Gray.

Traveling in Norway last summer, Mr. Gray had the good luck to see Ibsen and get a bow from him as he took his morning saunter along the principal street of Christiania; he sailed in the same boat with one of the most famous of Scandinavian pianists; he just missed meeting Jonas Lie; and at Laerdal, an uninviting village, he continued to keep a sharp lookout for celebrity or personal friend.

At last, a guest was seen to glide rapidly into the dining room at Herr Lindstrom's hotel, and take his seat at the supper table. The face was one to draw attention, though familiar enough in bust and photograph. But neither bust nor photograph can give any idea of the play of expression, the vivacity of gesture, the whole picturesqueness of air and demeanor that mark the personality of the great master of Scandinavian song, Edvard Grieg.

Mr. Gray found an opportunity to accost him, and off went the hat with a courteous Scandinavian sweep. The talk turned first upon Scotland, and Grieg, who speaks English fluently, asked Mr. Gray in what part of Scotland he lived.

"Not very far from the home of your forefathers," was the reply.

"Then (said Grieg) you live near Fraserburgh. Alexander Greig, my great-grandfather, who afterwards changed his name into Grieg, emigrated from Fraserburgh last century. I have various ties to Scotland. I have Scotch friends and my godmother was Scotch. I have known something of your Scotch writers, too, especially Carlyle. I am fond of reading Carlyle. And I admire Edinburgh. Edinburgh people are very kind. They have asked me repeatedly to visit them and to play, and I would do so willingly if it were not for the sea. Once, some years ago, I crossed from Bergen to Aberdeen. I shall never forget that night of horrors—never!

"I admire Scotch music greatly (continued Grieg), and I find a similarity between your Scotch melodies and our Norwegian ones, especially when the senti-

ment is grave, serious. . . . Every time I visit Jotunheim I pick up something fresh from the peasants and Saeter girls. But a great deal one hears defies transcription—the intervals are so peculiar. Take the scale of C minor; the fourth is often neither F nor F sharp, but something between them. It is all right as the peasants sing it, but let another try and it is different. These songs are by the peasants themselves. It is all that can be said. The authors are mostly nameless, the origin is largely unknown.

"There is no place like Jotunheim for the health, and especially for bracing the nerves (Grieg resumed next morning on the boat). Sometimes I don't sleep well there at first, owing to the rare air, but in time I get accustomed to it, and the sleep comes. I always enjoy Mentone; one has quiet there—quiet to do work."

Then the talk reverted to music. Mr. Gray explained to Grieg that he possessed the copy of a dirge by him in his own handwriting, and that the music had been repeatedly rendered before Scotch and English audiences, and never failed to produce a deep effect.

"Ah! (he said) you know 'Stille nu.' It was written in connection with the death of Welhaven, our national poet and was sung at the funeral of my father.

"Svensden is a great man. His music is Norsk, and some of it is grand, *magnifique*. Do you know his arrangement of the old air, 'Ifjor gjaett' e Gjeitinn' ('Last year I tended the goats')? The effect of it depends upon the time; it must be taken very slowly.

"Fourteen years ago, on my birthday, there was a family feast. I had at that time a cottage in Hardanger, and the guests gathered there, Ole Bull, then an old man, being one of them. The melody was a great favorite of his, and that afternoon we played it; he with his violin, which I accompanied on the piano, using Svensden's arrangement. How pleased the peasants were! They gathered from the fields and cottages, and took their stand near the house to listen."

Here a diversion occurred in the increasing grandeur of the scenery. Never surely was such wealth and variety of color brought together in a single bewitching scene. Grieg was enjoying it to the full. He moved rapidly from one point of view to another. Now he was at this side of the boat, now he was at that. Then he said: "I think this is the best of the fjords. Here you have Norway concentrated, all that is characteristic of its scenery brought together. German critics find fault with my music on the ground that I don't sufficiently follow up any one special idea. But those who want to understand my compositions must know Norway, and see pictures like the pictures we have here."

"Look, look," he added quickly, bending over the boat and pointing down to the water beneath. The wave had caught the reflection of a peculiarly brilliant bit of coloring, and rock, tree, grass, and blue sky went whirling and chasing each other, like the re-

volving tints of a kaleidoscope. The whistle sounded for Gudvangen, and Grieg, extending his gray hat at arm's length, bade Mr. Gray a friendly farewell, and soon became a retreating figure.

HANDEL.

UNIFORM with the special Mozart and Beethoven numbers, the *Musical Times* (London) this month brings out a Handel "Extra." Altogether it gives a very interesting account of the man and his genius, but it wants a bibliography of Handel's works and works relating to Handel.

THE MAN.

Mr. Joseph Bennett, writing of the man and his genius, confesses that of all the historic figures on the stage of English life during the reigns of the first two Georges, that of Handel has for him as much attraction as any. Among the gay and giddy throng of London society, Handel was one of those who excelled

HANDEL.

not only in talent, but in moral character. Yet he had the defects of his temperament, which was like a powder magazine, and exploded at the touch of a spark of annoyance. Like many men whom society accounts as bears, the composer had, however, a very tender and compassionate heart. Taking into account his worthy pride, his strong self-respect, his goodness of heart, pure life, high courage, and unfaltering perseverance, how small are his admitted imperfections!

Simplicity, directness, strength, are the elements of grandeur, and of musical grandeur Handel is the colossus. England blesses Handel, who, more than any other composer, has shown music's grandeur and far-reaching power to the popular eye. Referring to his feelings when he penned the "Hallelujah Chorus," he once remarked: "I did think I could

see all heaven before me, and the great God Himself."

BIRTHPLACE IN HALLE.

Handel's birthplace in Halle, as will be seen in the illustration, is a grand old house, possessing two tiers of garrets, therefore it is quite certain that the small tinkling of the boy's clavier-gebunden in the upper garret could not have been heard in any of the lower apartments occupied by the master of the house. The father desired a distinguished career in the profession of the law for his son, and therefore banished all musical instruments from the house; but the fond mother smuggled the tiny instrument into the upper garret. Handel's house in London stands on the south side of Brook street; it is now No. 25, but down to 1857 was No. 57.

AUTOGRAPHS AT BUCKINGHAM PALACE.

Sir Walter Parratt gives a brief account of the Handel MSS. in the Royal Music Library at Buckingham Palace. The collection, he says, contains many unique specimens, but it seems to be rather the result of accident and caprice than of method or design. It is complete in no department, and in musical literature it is very poor. The feature of the library is its collection of Handel's works. Of the volumes in the great composer's own hand there are between eighty and ninety, varying in size from the small quarto of the operas to the tall folio of "Israel in Egypt," all bound, as is fitting, in royal red morocco, and most beautifully tooled. The autographs show plenty of hasty erasures and corrections, from impulsive scratches of lines, never parallel, to rough smudges with apparently a hasty thumb, or even a brush with the whole arm. The "Messiah" has already been published in *fac-simile*, and it is to be hoped that at some early date other works may be given.

MSS. AT CAMBRIDGE.

Mr. A. H. Mann follows with a more detailed account of the Handel MSS. in the Fitzwilliam Museum at Cambridge. These comprise seven volumes in the handwriting of Handel, and several loose copies of his works made by his amanuensis, Smith. The Museum also contains two portraits of Handel. One shows him still a young man, and seated at an old-fashioned keyboard; he is also in full dress, with ruffles, and wears a crimson velvet cap instead of the usual wig. Another interesting original document, in the possession of Mr. W. H. Cummings, is Handel's will with the four codicils, the text reprinted in full. The various signatures to the codicils show how unsteady Handel's hand had grown between 1750 and 1759, and how much his sight must have been affected. The signature reproduced here is that of the second codicil, dated March 2, 1757.

HANDEL AND HIS LIBRETTIST.

One of the legacies in Handel's will is that of £200 to Dr. Morell, of Turnham Green, the author of several of the libretti set by Handel. One day Dr. Morell ventured to tell the composer that the music of a certain air did not exactly render the sense of

the words, whereupon Handel flew into a passion, and cried out with the anger of insulted pride: "Vat, you teach me music! De music, sir, ish good music. It is your vords ish bad. Hear de passage again" (repeating vehemently on the harpsichord.) "Dere; go you, make vords to dat music." Handel, we are further told, was irascible, but not vindictive—which, perhaps, accounts for the £200 legacy.

THE PERFORMER.

Handel's power as an organist and harpsichord player was only second to his strength as a composer. The mastery which he displayed over the largest instruments, his command of the pedals, his splendid execution, left him for many years of his life unrivaled. Even at the early age of twenty-one he found but one man in Italy worthy to be called his rival. This was Scarlatti; and when "the dear Saxon," as the Venetians named Handel, visited their city, much excitement was caused by the friendly competition between the two players. In the end, the Venetians awarded to Scarlatti the palm for playing the harpsichord, but decided that Handel was far his superior in organ playing.

This rivalry, happily, was thoroughly amicable; indeed, on the part of Scarlatti, it resulted in a genuine feeling of regard and admiration; he never spoke of Handel but with the greatest respect, and used to cross himself whenever he pronounced the Saxon's name.

GEORGE SAND'S RELIGIOUS FAITH.

MME. TH. BENTZON gives the readers of the *Century* a pleasing sketch of her acquaintance with George Sand, who was in many respects her literary patron.

In a letter to the writer, Mme. Sand thus confessed herself: "It is not well to pass too quickly from one belief to another. It has taken me thirty years to find again in philosophy the firm beliefs which I had formerly in dogmatic teachings, and I find myself much more religiously inclined than ever I was; but I have gone through the torture of fearful doubts. . . . But you must not suffer your soul to remain void of a faith, for talent is not developed in an empty soul. Talent may for a while agitate itself feverishly in such a soul, but it will perforce take its flight from it or die out. . . ."

"I thoroughly believe that on certain points we are thus far greatly in accord: God, a God who knows us, whom we can love, to whom we can pray, and who, while being all things, is also himself, and wishes to see us be ourselves. An active, honest, courageous and unselfish life; the duty of enlightening and of elevating our soul, which of course is immortal, and which will survive us with the consciousness of itself. No hell! Infinite mercy in the necessary law of progression. Expiatory punishments for the souls which have failed to recognize their own divinity; a more rapid progression toward God for those who have greatly striven after good. I do not think that I have so far given offence to anything essentially Christian."

GRIEG ON SCHUMANN.

THE January number of the *Century* has an excellent and sympathetic article on Schumann by Edvard Grieg, from which it is almost impossible to quote except in its entirety. Here, however, are one or two ideas:

"Schumann has never ostentatiously summoned any body of adherents. He has been a comet without a tail, but, for all that, one of the most remarkable comets in the firmament of art. Mendelssohn received, as it were, more than his due of admiration in advance; Schumann less than his due. Posterity had to balance their accounts. . . . In conjunction with Chopin and Liszt, Schumann dominates at this time the whole literature of the piano. In orchestral compositions Mendelssohn still maintains his position, while Schumann has taken a place at his side as his equal."

Grieg brings a grave charge against Wagner. In 1879 an article appeared in the *Bayreuther Blätter* on Schumann's music. It was signed "Joseph Rubinstein," but it is an open secret that the article was inspired by Wagner. In it Wagner treats with the greatest contempt the very greatest qualities of Schumann. Wagner, the artist, was as one-sided as he was great. Schumann was anything but one-sided. Mendelssohn's horizon, too, was too contracted to enable him to see Schumann as the man he was, and in his letters he does not once refer to Schumann or his art.

Grieg concludes: "Schumann, Mendelssohn and Wagner stand in a peculiar relation of reciprocity to each other. Each has either sought to be influenced by the other, or purposely sought to avoid being influenced. Each owes the other much, both positively and negatively. Whatever his imperfections, Schumann is yet one of the princes of art; like Luther, a real German spirit, in whom all the virtues and all the faults of the Germans are in the grandest way united, so that one may say that he personally represents the wonderful Germany."

ANNIE S. SWAN'S CAREER.

THE *Sunday Magazine* gives a sketch of Mrs. Burnett Smith, better known as Annie S. Swan, at home. The writer is much impressed by the sympathy that expresses itself in her face and voice. What strikes him "above everything is her frank simplicity and utter absence of affectation." Asked what first impelled her to a literary career: "'It was the gaining of a prize,' she replied. 'A prize of three guineas was offered by Messrs. Leng, of the *Dundee Advertiser*, for a short story. I succeeded in winning it, and this impelled me to go on writing. But I had always been fond of story writing.'

"My first book was an unfortunate affair. It was published through that wretched Charing Cross Publishing Company, as it was called. After that I wrote a number of books for young people, and sent them to various publishers. They were refused by several,

but were all accepted and published in the end. This is what I advise all young writers to do. It is better than sending stories to the magazines. My youngest sister, Maggie, began in the same way, and she is doing very well."

Her first great success was "Aldersyde," but "that was owing in great measure to Mr. Gladstone," who in an appreciative letter described it as "a real work of art." "Sheila" is her own favorite.

A NEW POET: MR. FRANCIS THOMPSON.

"A NEW poet"—not another of those "high-class mediocrities who during the past twenty years have blazed into immense circulation," but one of the prophets of verse—is announced to the world in the *Fortnightly* by Mr. Coventry Patmore. He predicts for Mr. Francis Thompson—thanks in great part to the "heroic" devotion to the interests of his muse shown by "a lady not inferior in genius to his own"—"a wide and immediate acknowledgment," and a place in "the permanent ranks of fame with Cowley and with Crashaw." Mr. Thompson, in offering for "concrete poetic passion" what is "mainly an intellectual ardor," is "a greater Crashaw."

"ONE OF THE VERY FEW GREAT ODES."

The masculine element shown in "profound thought and far-fetched splendor of imagery" predominates; the feminine feeling of taste is insufficiently present. New words from the Latin "Mr. Thompson's muse hatches by the dozen." But of all who have of late attempted the difficult and delicate and exacting metre of the "irregular ode," Mr. Thompson is, to the writer's thinking, "the only one who has in some large measure succeeded." "The 'Hound of Heaven' has so great and passionate and such a metre-creating motive, that we are carried over all obstructions of the rhythmical current, and are compelled to pronounce it, at the end, one of the very few 'great' odes of which the language can boast."

Other poems are such as "Laura might have been proud and Lucretia not ashamed to have had addressed to her."

A PIONEER OF A NEW HEAVEN AND EARTH.

After stating that "the main region of Mr. Thompson's poetry is the inexhaustible and hitherto almost unworked mine of Catholic philosophy," Mr. Patmore goes on to say: "Mr. Thompson places himself, by these poems, in the front rank of the pioneers in the movement which, if it be not checked, as in the history of the world it has once or twice been checked before, by premature formulation and by popular and profane perversion, must end in creating a 'new heaven and a new earth.'"

"Poetry of the very highest and most austere order is almost the only form in which the corollaries of the doctrine of the incarnation, to which the deepest minds are now awakening, can be safely approached.

"Mr. Thompson's poetry is 'spiritual' almost to a

fault. He is always, even in love, upon mountain heights of perception, where it is difficult for even disciplined mortality to breathe for long together."

THE PERSONALITY OF FRANCIS PARKMAN.

THE Rev. Julius H. Ward concludes an excellent article on Francis Parkman in *McClure's Magazine* by these interesting statements of the indomitable historian's personal habits:

"His greatest difficulty was to gain sleep. The sensitiveness of his brain to excitement was excessive, and he never worked except in the morning. The afternoon was given to exercise, and in the evening he quietly rested and hoped for a good night's sleep. The least excitement induced wakefulness, and it was rarely the case that he could sleep enough to restore his strength. He delighted in rowing and in walking. When he could bear it he rode horseback, and as a young man he always asked for the hardest horses to ride. He suffered from water on the knee, and because of this and frequent attacks of rheumatism he was obliged to use crutches or a cane in walking. In religious belief, treating reverently always the faiths of others, he felt for himself that the unknown was greater than the known in the deeper things of life.

CHARACTERISTICS.

"In person he was of medium height, and in his later years he inclined to fullness of habit. He had the shoulders and arms of an athlete, and his ruddy face and twinkling eyes gave the assurance of robust health. His features were delicate, his face was always clean shaven, and in conversation his features were lighted up by an expression just breaking into a smile that lent a special interest to what he said. His eyes were restless and full of fire. His head was large and well set upon his shoulders, and there was in his bearing a dignity and refinement which gave special distinction to the man. His presence brought what was best with it, and his spirit was that of one who could do immensely more than he allowed himself to. He spoke of his life as one of 'repressed activity;' and his bearing was that of a man who held himself in check. He was always modest and reticent about himself, and the prefaces to his different volumes were almost the limit which he allowed himself in speaking even to intimate friends about his work. He hated falsehoods and shams, and could denounce them in the plainest of English. Had his health allowed him to go to any extent beyond his historical work he would gladly have become a publicist, and engaged in the discussion of public questions on which he had something to say; but when his work was done he had no strength left for tasks like this. At threescore-and-ten he had earned the right to rest, and his health was so delicate that this was all that he could do. His life was unique in its purpose and results. It was entirely devoted to the realization of a single great conception, and every available moment of good time was put into that. His work was great, but his life was greater."

LORD WOLSELEY ON NAPOLEON.

“BY far the greatest of all great men,” though “a bad judge of character,” is the estimate which Lord Wolseley gives of his hero, in an article in the *Pall Mall Magazine* on “The Decline and Fall of Napoleon.” He begins by predicating of the Corsican an unquestioned falling off in his brain power towards the end of his career.

THE SECRET OF NAPOLEON'S DECAY.

“Upon several occasions during his later years he was subject to periodic attacks of a mysterious malady. Its nature has been variously described; but it was so much his interest and that of those around him to conceal the facts and disguise the

LORD WOLSELEY.

symptoms, that the world is still ignorant of what the disease really was. . . . It usually followed upon periods of enormous mental and physical exertion, and generally during great exposure. It may, perhaps, be best defined as a sudden attack of lethargy or physical and moral prostration, sometimes accompanied by acute bodily pain. Its effects, as known to lookers-on, were that at some critical moment of a battle his wonderful power of quick and correct de-

cision seemed to desert him; so much so, that for the time being he almost abandoned the reins to chance.

“The most abstemious of young officers had become in 1812 the pampered ruler of a court Oriental in its luxury, and had already, at the age of forty-four, impaired his general health by indulgence in its dissipations.”

The writer proposes to show how on three critical occasions this seizure affected his destiny. The general scheme of the grand army “was worked out with a splendor of conception and a mastery of detail which, I think, stands unrivaled in the history of the world.” Yet in all his plans he had none to meet the accident of non-success. At Borodino “nothing could be more perfectly conceived, or in design better elaborated, than Napoleon’s plan of attack; but from a variety of causes the execution was poor and unsuccessful. One of those causes was an overwhelming attack of his mysterious malady at the most critical period of the battle.”

“THE DECREE FROM ABOVE.”

Lord Wolseley thus expresses himself on Napoleon’s mission: “The invasion of Russia ended in disastrous failure. Those who like may attribute this fact to mere ill-luck on Napoleon’s part; but to me it seems truer to say that he was no longer the leader he had been in his early campaigns, and that his great work was done. He had destroyed the rotten remains of systems which had lingered on in Europe from the middle ages. Though as Emperor he may have sought to revive some of them, what he had done in the plenitude of his power rendered hopeless any attempt to restore them except artificially, and even then with the certainty that they must soon disappear altogether. But it was time that his own despotism should pass away. It pressed too heavily upon the civilized world, and it was essential for human interests that Europe should once more breathe freely. The decree from above had gone forth against him.”

SHELLEY IN SOME NEW LIGHTS.

MR. WILLIAM GRAHAM brings his “Chats with Jane Clermont”—who was an intimate friend of both Byron and Shelley—to a conclusion in the *Nineteenth Century* for this month. The conversations, which are full of interest to all students of the two poets, took place shortly before the old lady’s death in 1879.

“A VERY GOOD BUSINESS MAN.”

Speaking of Shelley’s bequest of £12,000 to her, she remarked: “Shelley was a very good business man. It is, of course, the fashion to consider him as a being quite too ethereal to care for mundane matters; in point of fact a kind of inspired idiot. But that is entirely a mistake. No one could be more practical than Shelley, if he liked. He had a most logical mind, and was, perhaps, the first classical scholar in Europe of his time. . . .

“‘I can imagine Shelley,’ I said, ‘almost like a pretty girl himself.’

"She replied indignantly: 'Not at all; there was no lack of manliness about Shelley. He was utterly without any sense of fear; always in the open air, yachting, or taking strong physical exertion. He was the finest walker of any man of the Byron-Shelley clique, and could tire out almost any of the others.' . . .

DID HE SMOKE?

"I once asked Madame Clermont whether Byron or Shelley smoked.

"'Shelley,' she said, 'never did. Byron at one time, when I first knew him, was a great smoker, but afterwards abandoned the habit almost altogether. On rare occasions, however, he would renew it, and when he did it was usually to excess.'"

BYRON AND SHELLEY'S ESTIMATE OF WOMEN.

Madame Clermont thus contrasted the attitude of the two poets: "'Byron and Shelley were as far asunder as can be imagined in their estimate of women. Byron considered them as men's inferiors; he held an absolutely Oriental view of women. He was fond of saying that he did not think they had any right at the table with men, and ought to be shut up in seraglios, as they are in the East.' . . .

"'Shelley had an irresistible attraction for all women, his nature was so pure and noble; the tone of his poetry whenever a woman is mentioned is of an almost unearthly purity. Instead of holding with Byron that woman is inferior to man, he looked up to woman as something higher and nobler.'"

THE KEEPER OF THE SECRETS OF LONDON.

SIR GEORGE LEWIS is the subject of Mr. Harry How's "illustrated interview" in the *Strand*. The sketch makes more than usually good reading. Sir George is thus described: "A kindly, genial man, whose very appearance wins your immediate confidence. He is of medium height, strongly built, with white hair and whiskers. He is deliberate in every action and every word. . . . He has the most wonderfully penetrating eyes I have ever seen. Penetrating! He never takes them off you. I have seen Sir George take in the beauties of a Burne-Jones with one eye, and with the other look at you!"

LOVE OF ART AND HOME.

Mr. How saw him at his cottage at Walton-on-Thames, at his house in Portland place and in his private room at his business abode in Ely place.

"His house is the home of a man of true artistic instincts. Art with Sir George runs in a very delightful channel. He will have the work of our most eminent artists, and their brushes are employed to chronicle the features of the children of the great lawyer. .

. . . So I found it in all the rooms of the house—pictures of his wife and his children are given the place of honor everywhere."

Lady Lewis, it appears, "is a most enthusiastic collector of first editions, and has volumes that would positively make a Quaritch envious." "It is probable that no professional man has received so many gifts from his clients as Sir George Lewis." His drawing room is rich with them. He has a cellar full of them.

THE AWFUL "CONFIDENCES OF LONDON SOCIETY."

Ely place, Holborn, "is a very old bit of London, and is governed by a separate act of Parliament. It is the only place in the metropolis where the old-time custom of crying out the hours of the night by the porter is still kept up."

"While driving down, Sir George said: 'One branch of my profession is that which never becomes public—that is, the secrets of London. I have not kept a diary for over twenty years. When I found that my business was becoming so confidential I determined that I would never chronicle another thing—so when I die the confidences of London society die with me. . . . Let me tell you (and Sir George spoke very calmly, without a tinge of egotism in his tone) that no novel was ever written, no play ever produced, that has or could contain such incidents and situations as at the present moment are securely locked up in the archives of memory which no man will ever discover.'"

SIR GEORGE LEWIS

PARNELL'S ONLY CONFIDANT.

When Mr. Parnell, till then an entire stranger, sought his help in the matter of the commission :

"I told Parnell that I would give him my assistance on one condition—that he would give me his word of honor that he would come to me, at all times, when I wanted him. He gave me his word and faithfully kept it. . . . In my early associations with him he one night followed me to Ashley Cottage. After a long conversation, . . . noticing his anxiety and wishing to gain his confidence, I put out my hand and said to him, 'I should like you to give me your entire confidence—you may trust me as you would your brother.' We shook hands earnestly, but . . . it was not until after many months that I felt sure of his complete trust. I think he trusted me when he would nobody else, and at one time I was the only person who could communicate with him."

HIS FIRST CASE.

George Lewis was born on April 21, 1833, and is the son of James Graham Lewis, the founder of the firm. His first school was at Edmonton.

"I remained at Edmonton till I was thirteen or fourteen, when I went to University College, Gower street, until I was seventeen and a half, when I was brought here and articled to my father. I served my five years and was admitted as a solicitor in Hilary, 1856.

"What was your first case, Sir George?" I asked.

"It occurred during the absence of my father. I was about nineteen at the time. A hansom drove up here and a woman rushed into the office in a terrible state of mind. She told me that her son was in custody at Westminster police court on a charge of robbing a till in a public house. I rushed away with her in the cab, fought the case and won it, though I will admit to you that whilst I was questioning the witnesses I didn't know whether I was on my head or my heels. The mother was a very big, muscular woman, and waited for me outside. I was made very happy by the words which accompanied her little-too-enthusiastic smack on the back: "Well done, young 'un!" But her enthusiasm hurt."

SOME OF HIS OPINIONS.

Sir George confessed himself in favor of a Criminal Court of Appeal. He would allow divorce to any woman whose husband was sentenced to three years' imprisonment or had deserted her for three years.

"He spoke magnificently of the Salvation Army in its work in aiding wrong-doers to a respectable level again, and said: 'I know of no organization that dips so low and rescues so many out of the deepest destitution.'"

"I consider that the greatest advocate off the Bench in my day is Sir Charles Russell. By common consent he is admitted by the profession to be the strongest advocate within legal memory."

Sir George "assures you he does not know what it is to have a night's rest disturbed." "He never rode

a horse in his life," and "his only vice," is a good cigar.

THE DUCHESS OF YORK.

MADemoiselle BELLOC contributes to *The Woman at Home* a pleasing little sketch of the Duchess of York. Despite the innumerable articles which have appeared on the subject, she contrives to tell much that is new, and to tell all with freshness.

"It is probably little known," says Mademoiselle Belloc, "that through her father as well as through her mother the Duchess is descended from an English king. Thus while she can claim George III as a great-grandfather, the Duke of Teck is the direct descendant of George II, through the latter's daughter, Anne, Princess of Orange." Of her childhood, Princess May is credited with the unflattering estimate: "I was very naughty, very happy, and very uninteresting."

AS PRIVATE SECRETARY.

Thousands of young women engaged as amanuenses doubtless feel pleasure in knowing that the lady who is possibly to become their Queen has once served in their capacity. Part of her morning's work was to take down from dictation the Duchess of Teck's letters, business and philanthropic: "Even this autumn the Duchess of York returned to the White Lodge for a week or ten days in order to help her mother to sort and arrange the thousands of parcels sent in by the Needlework Guild for distribution. An eyewitness once described how she had seen both ladies standing hour after hour sorting out great piles of calico shirts and unbleached linen underwear."

But this heiress to monarchy has been disciplined under a matriarchate stricter than most girls have to submit to: "Like the Princess of Wales, the Duchess of Teck has strict views on the education of young girls. Till her marriage the Duchess of York never read a novel which had not already been glanced at by her mother, and till the weeks she spent with the Queen, shortly before her engagement to the Duke of Clarence was announced, the Princess had never paid a visit unaccompanied by either father or mother."

SINCE THE MARRIAGE.

The duties of the new royal pair are neither slight nor few. "To one accustomed to a simple country life and the constant companionship of so powerful and remarkable a woman as the Duchess of Teck, the perpetual round of official and public work of all kinds cannot but be exceptionally trying.

"Since their marriage it is significant that neither the Duke nor Duchess has ever failed to keep an appointment, and the Princess May's early methodical habits must now stand her in good stead. . . . She writes to her mother every morning and is in constant communication with her three brothers, to whom she is tenderly attached; and, even as a married woman, she is faithful to a plan begun many years ago, of mapping out each month a course of useful reading.

"When at Sandringham the Duke and Duchess of

York lead a busy but quiet life. The Duchess takes great interest in her garden, having inherited her father's love of flowers; her favorite blossoms are lilies of the valley."

Speculating on future influences in the way of setting the fashion in ladies' dress, Mlle. Belloc remarks that "the Duchess does not share the love of bright coloring evinced by many members of the royal family."

THE LATE PROFESSOR TYNDALL.

Professor Huxley's Tribute to His Old Comrade.

A DEEP personal interest attaches to the article on Professor Tyndall with which Professor Huxley opens the *Nineteenth Century*. They were the great twin brethren of belligerent evolutionism. Every one is aware of their scientific and polemical prowess; but, of the warm and genial brotherhood subsisting between them, we have here glimpses not generally attainable before. The terms in which the survivor speaks of his friend have about them much of the charm of self-revelation. They set the writer before the public in a tenderer light than they have usually seen about him. "On my own account," he says, "I have desired to utter a few parting words of affection for the man of pure and high aims, whom I am the better for having known; for the friend, whose sympathy and support were sure."

HIS CHARACTER.

Accustomed to classifying men, he found it hard to get his new friend into any of his pigeon holes. His character might be described thus: "Impulsive vehemence was associated with a singular power of self-control and a deep-seated reserve, not easily penetrated. Free-handed generosity lay side by side with much tenacity of insistence on any right, small or great; intense self-respect and a somewhat stern independence, with a sympathetic geniality of manner, especially towards children, with whom Tyndall was always a great favorite. Flights of imaginative rhetoric, which amused (and sometimes amazed) more phlegmatic people, proceeded from a singularly clear and hard-headed reasoner, overscrupulous, if that may be, about keeping within the strictest limits of logical demonstration, and sincere to the core. A bright and even playful companion, Tyndall had little of that quick appreciation of the humorous side of things in general, and of one's self in particular, which is as oil to the waves of life."

But this "string of epigrammatic antitheses" seems inadequate to those to whom "the powerful faculties and the high purposes of the mind revealed themselves. And to those who knew him best the impression made by even these great qualities might well be less vivid than that left by the warmth of a tenderly affectionate nature."

THEIR RELATION TO CARLYLE.

When they first met both Tyndall and Huxley had long been "zealous students" of Carlyle's works. Tyndall's appreciation was even more enthusiastic

than Huxley's. To the former Carlyle was a "great teacher;" the latter regarded him as a "great tonic."

TYNDALL'S SINCERITY AND VERACITY.

"Tyndall was not merely theoretically, but practically, above all things sincere; the necessity of doing at all hazards that which he judged, rightly or wrongly, to be just and proper, was the dominant note of his character. . . . Of the controversies in which he became involved, some of the most troublesome were undertaken on behalf of other people who, as he conceived, had been treated with injustice. The same instinct of veracity ran through all Tyndall's scientific work. That which he knew he knew thoroughly, had turned over on all sides, and probed through and through. . . . And in dealing with physical problems I really think that he, in a manner, saw the atoms and molecules, and felt their pushes and pulls.

"This quality of active veracity, the striving after knowledge as apart from hearsay, lay at the root of Tyndall's very remarkable powers of exposition and of his wealth of experimental illustration."

"CONSUMED HIS OWN SMOKE."

Speaking of the brilliant addresses given at the Royal Institution, Dr. Huxley observes: "I used to suffer rather badly from 'lecture-fever' myself; but I never met with any one to whom an impending discourse was the occasion of so much mental and physical disturbance as it was to Tyndall. . . . From the first, Tyndall suffered from sleeplessness, with the nervous irritability which is frequently cause and consequence of that distressing malady. It is not uncommon for this state of nervous system to find a vent in fits of ill-temper; but, looking back over all the long years of our close intercourse, I cannot call to mind any serious manifestations of that sort in my friend. Tyndall 'consumed his own smoke' better than most people."

Another Estimate of Tyndall's Work.

Mr. P. Chalmers Mitchell contributes to the *New Review* a somewhat coldly-critical estimate of Professor Tyndall. "Tyndall's actual scientific work has left little impression upon science. . . . He had all the instincts of the intelligent amateur joined with intellectual vigor and a herculean capacity for work. . . . His business was to cater for the public and to bring to their notice the newest scientific goods from France and Germany." The secret of his gigantic reputation was the admirable diligence, training and keenness at his work, his "wonderful gift of golden speech;" "an impatient dogmatism," unable to regard his opponents as other than willfully wrong—from his isolated upbringing "he learned to regard himself as one of the elect in a mass of heathens;" he was the popular exponent of the Darwinian theory; and his Belfast address gave him the unrivaled advertisement of the opposition of the churches. Metaphysically, he was not a materialist, but rather a sensationalist, but he tried to combine with it the "biological view."

THE PERIODICALS REVIEWED.

THE FORUM.

WE have reviewed in another department the two political articles by the Hon. David A. Wells and the Hon. William L. Wilson.

THE DECLINE OF THE AMERICAN PULPIT.

In this era of Biblical criticism it is refreshing to read Rev. G. Monroe Royce's article on the "Decline of the American Pulpit." He asserts that the pulpit does not exert the influence in this country it once did, and for the reason, he holds, that it has become in great part materialistic in its tone and feeling. In his opinion the utterances from the public on labor troubles and other social questions have gone a great way towards weakening the influence of the clergy, due in a measure to the crude expressions of preachers who have not always taken the trouble to know a thing before they pronounce judgment upon it, and he doubts if it is ever wise for the preacher to bring into his pulpit the "topics of the hour," be they financial, political or social. He declares that the importance given in this country and in our pulpits to the utterances of such men as Tyndall, Spencer, Huxley and Harrison upon religious matters is "worse than absurd; it is mournful," and he adds that "while we all know that these gentlemen are authorities in their own chosen fields of research, they are certainly not authorities in religious matters, and that their names and their work should be so frequently mentioned in our pulpits is simply scandalous." He tells us that they receive no such attention in England, and that during his sojourn there he never heard the slightest reference made to them by any English clergyman in his public ministrations. The keynote of his article is that "vision—spiritual vision—is what the pulpit needs."

THE EAST VERSUS THE WEST AND SOUTH.

Mr. Lindley M. Keasbey, who writes from Boulder, Col., warns the East that its attitude on the silver question is forcing upon the country a new sectionalism. "While the East continues to argue the same old abstract question of finance and is aimlessly endeavoring to explain to the Western people the error of their ways, the Western people in turn," says Mr. Keasbey, "are quietly bringing the South to their ways of thinking under the very nose of the East. . . . For months past the emissaries of the West have been hard at work among the plantations of the South, drumming up recruits for the cause of silver. Much the same arguments are now being used in the Southern States as were successful before in converting the ranchmen of the plains. Knowing that the Southern planters had still their heavy debt to pay, contracted during the period of reconstruction, and being convinced that they, too, had been obliged to sell their crops during the last twenty years in a constantly falling market, the Westerners, with their scheme for cheap and plentiful money, are once again employing that all-powerful lever of personal interest to shift the Southern States to their side. To win and to hold the South to their cause, these clever politicians have furthermore added a free trade plank to their original silver platform. Instead of fighting for free coinage alone, the West now offers to broaden the campaign and to enter into a struggle with the South against the Northeast for "Free Silver and Free Trade among Free Americans."

Mr. Keasbey asserts that the South holds the key to the entire situation and that upon her outward alliance may depend the final victory.

THE GROWTH IN PERIODICAL LITERATURE.

Mr. Ainsworth R. Spofford, Librarian of Congress, writes on the subject "Directions and Volume of Our Literary Activity." He notes a strong drift towards new methods of reaching the public mind—through periodicals rather than through books. A few years ago periodicals devoted mainly to literature were few. Authors relied almost wholly on the book publishing market for their wares and the modern "literary syndicates" were unknown. The recent increase of periodicals devoted wholly or mainly to literature has been phenomenal, as will appear from the following extract we select from Mr. Spofford's article: "In 1883 there were published in the United States 428 reviews, magazines and other periodicals of this class; in 1893 there are no less than 1,051. Still greater has been the increase of periodicals devoted to science, invention, transportation and the technical arts, this class numbering 146 ten years ago, while now there are 611 covering the same field or new fields under those general heads. Of law periodicals the growth has been from 43 in 1883 to 60 in 1893. Medical and hygienic science exhibit an increase from 121 to 201 in the last decade. There have been many new periodicals started to meet the wants of special workers, as for example, authors, actors, typewriters, stenographers, engineers, electricians, telegraphers, photographers, jewelers, lumbermen, ironworkers, cabinetmakers, and even bicyclists, all of whom have their special journals. So wide and copious has become the information diffused by periodicals, that it is held by many that books on the related subjects have chances of far less sales than formerly."

The literary activity of the times, as shown by the entries for copyright at Washington, would appear to be on the increase, since the publications registered for 1893 exceeded by some 3,000 those of the corresponding period of 1892.

THE RESULTS OF THE NEW COPYRIGHT LAW.

Mr. George Haven Putnam sets forth some of the results of the copyright law of March, 1891, the most important of which are naturally found in the literary relations between the United States and Great Britain. While the sales in England of authorized editions of average American books have increased less rapidly than was hoped, he finds that there has been a steady growth in these sales, and confidently predicts that the near future will witness a more rapid development. The English authors have not gained by the copyright law so much as they had expected, but, nevertheless, there appears to have been a substantial advance in the sale of English books in the United States. Besides English authors have to-day the satisfaction of placing their books before their American readers with a correct and complete text. Mr. Putnam also notes a considerable increase in the number of international undertakings, works or series, the contributions to which are written by the best authorities on special subjects, the writers for which are secured from this country, from England, or from the Continent, wherever the best men happen to be.

THE WORK OF THE NEW YORK CHILDREN'S AID SOCIETY.

Under the title "A Christmas Reminder of the Noblest Work in the World," Mr. Jacob A. Riis sets forth as an example the good work that has been accomplished by the Children's Aid Society of New York. This society was founded forty years ago. Its inspiration was the late Charles Loring Brace. The distinctive method employed

by the society has been to remove from the slums of the city the little homeless vagrants and place them in farm houses where, surrounded by healthful influences, they might grow up honest, self-supporting men and women without expense to the public. The results show that of eighty thousand children so transplanted in the forty years of the society's existence scarcely four per cent. have turned out bad. The society at present has four day schools in the worst tenement house districts of New York, thirteen night schools, five boys' lodging houses, one lodging house for homeless girls, a farm school in Westchester County, a children's summer home and a cottage for crippled girls at Bath Beach, a health home at Coney Island and a sick children's mission with headquarters in an East Side lodging house. The schools have sheltered over one hundred thousand children since the first one was opened in Roosevelt Street Church.

THE NORTH AMERICAN REVIEW.

THE articles, "Income Tax on Corporations," by Hon. William L. Wilson; "Are the Silver States Ruined?" by Governor Waite; "How to Prevent a Money Famine," by Comptroller Eckles, and "Tariff and Business," by ex-Speaker Reed, have received extensive notice in the preceding department.

REPUBLICANISM IN BRAZIL.

Salvador De Mendonca, the Brazilian minister at Washington, who reviews at length the rise of republicanism in Brazil, points out that the republic's chief danger would be in looking backward. He says: "The revolution has given to Brazil republican institutions which must be defended at all hazards, leaving whatever defects they may have to be remedied by wisdom after the safety of those institutions has been assured. Were the republic as bad as its worst enemies state it, he asserts, it would still be preferable to any monarchy that could be set up on its ruins, and he is equally positive that restoration is now impossible in Brazil.

IN DEFENSE OF THE ADMINISTRATION'S HAWAIIAN POLICY.

Mr. Frederic R. Coudert sifts the evidence that has been presented in the Hawaiian case, deciding that the administration is justified in the policy it has pursued with reference to the islands. He charges Mr. Stevens with having been altogether too hasty in recognizing the provisional government. This is the part which, in Mr. Coudert's opinion, Mr. Stevens played in the overthrow of the monarchy: "The truth seems to be that he had arranged matters with the insurrectionists; that he had given them his promise; that the soldiers had been landed; that the moral forces at his command were used, and the physical held ready for action, and when, under these combined influences, the government resigned, he appeared for the first time formally to recognize an administration of his own creation."

OUR FAST CRUISERS NOT FAST ENOUGH.

Discussing the question, "Is the Value of Our Fast Cruisers Overestimated," Rear-Admiral Daniel Ammen, U. S. N., asserts that there would be little chance of their capturing, for instance, a British merchant vessel on the high sea. "Half a dozen six-pounders put on the stern of a vessel endeavoring to escape, directing their fire particularly at the smokestacks of her pursuer, would probably riddle and tear them to pieces by carrying away whole sheets on the farther side, at a distance of more than three thousand yards, and otherwise inflict great damage to even the typical fast cruiser." While the modern battle ship would have little success in overhauling merchant vessels of foreign countries, Mr. Ammen

thinks that we could turn them to good use in supplementing our distinctly battle ships in protecting the coast.

GRAND OPERA IN AMERICA.

Under the title, "Wagner's Influence on Present-Day Composers," Anton Seidl takes occasion to discuss the subject of the establishment of Grand Opera in the United States. He declares that not until opera has become a permanent institution in this country, as it has, for instance, in Germany, can we expect American composers to achieve much in this field, for, under the conditions in which they are now working they receive practically no encouragement whatever to make such artistic endeavor. "The labor of writing an opera is enormous; the reward should be proportionate; but as far as this country is concerned they are so meagre that they may as well be left out of the account as not. This is a disheartening fact, but we might as well face the truth." Seidl, however, believes that the conditions will soon be changed, and that the time is approaching when American composers will receive an incentive to put forth their best efforts. As a preparation for writing librettos nothing, he thinks, could be finer than the study of Wagner's operas, representing as they do the perfect blending of drama and music.

THE ARENA.

"THE True Education and the False," by William Ordway Partridge, occupies the position of honor in the current number. "Education means a leading or drawing out of every human faculty," nothing more nor less. The school which falls short in any branch, music, mathematics, physical training tending toward this end fails of its object. The creative faculties are those which suffer most in this age and need the tenderest care. Unfold the child's whole nature, develop its æsthetic side, draw him through the intricacies of the subjects distasteful to him by the reward that comes with those he likes. There should be no blank walls in the school rooms, manual labor should be introduced, idle hours filled with what is wholesome for mind and body. In the end they will fill themselves with the results of the true education. Our willingness and endeavors to substitute the true for the false are the steps toward the accomplishment of this end.

"A National Problem," by C. H. Lugrin, deals with a special phase of the land question—one of the results of the rapid growth of our territory and the abundance of fertile soil available for settlement, the enormous indebtedness (\$10,000,000,000 or more) which we have incurred on the faith of the country's development. The interest on that debt must be paid by exports or in bullion. Our exports consist largely of the produce of the soil, and since we are fast approaching the point where home production and consumption will be equal, exportation must cease. The balance between debit and credit, long maintained by foreign investments, is liable further to be disturbed by a probable falling off in them brought about by various causes. Consequently, we must either default or ship abroad enormously increased amounts of gold yearly. The policy recommended for the solution of the problem is, 1, opening new markets for our products by a close bimetallic and free-trade union of American nations; 2, by a return to the idea that our people should be producers, not wage-earners.

Stinson Jarvis concludes his "Ascent of Life" and Hensoldt gives us the first installment of what promises to be a most interesting paper on mysticism, "Among the Adepts of Serinagur." We have reviewed in another department Hamlin Garland's paper on the land question in its relation to art and literature.

THE NEW REVIEW.

THE *New Review* this month enters another epoch of its progressive career. Mr. Wm. Heineman replaces Messrs Longman as its publisher. Mr. Archibald Grove remains its editor. The number and size of its pages have been increased, but not the price. It has adopted illustrations as an "integral part" of a "serious review," and a short story "to be selected entirely on its merits." Mr. Grove is a bold man to promise that "every MS., by whomsoever sent in, will be carefully considered." May he survive the inundation! Perhaps for this concession to fiction he is anxious to make amends by insisting repeatedly on the "serious" character of his review. He uses the word four times in his prefatory announcement. He notes as a curious fact that while other kinds of periodicals have moved with the times, the review "has, up to the present, budged only in the slightest degree from the severe position it occupied when periodical literature appealed merely to a very small class of people."

The new number makes a very favorable impression. Count Tolstoi's contrast of "The preaching of Christ and the practice of His Churches," Mr. P. C. Mitchell's surgical analysis of Professor Tyndall's greatness, Mr. E. H. Bailey's inquiry "Is our Life-boat System Effectual?" and the two anonymous articles on the Anarchists receive notice elsewhere.

PHOENICIAN SARCOPHAGI AT CONSTANTINOPLE.

Professor Max Müller seems bent on sending people to Constantinople. He once more expatiates on its attractions, and assures timid travelers of its protection by law and police. His special topic is "The New Museum and the Zidon Sarcophagi." The latter—twenty-one in number—were discovered in 1887, in the first instance accidentally, by Hamdy Bey, "the one real lover of ancient art" whom Turkey has produced. The dates of several are placed in the fifth century B.C. One, of black marble, bears two inscriptions—the first in hieroglyphics, stating it was occupied originally by an Egyptian general, Penephtah; the second in Phœnician, naming King Tabinith of Sidon as the last occupant. Another, of white marble, is called Alexander's, but most incorrectly so. There are many fine specimens of Egyptian, Lycian and Greek sculpture.

DISESTABLISHMENT IN ENGLAND.

Mr. Augustine Birrell recalls the change that has passed over the Established Church since the days of Dean Stanley and his friendly attitude to Nonconformists. Now, "the broad school of theologians is as dead as the Manchester school of politicians." Of the Evangelical party "there is but a remnant left," and that remnant in a very bad state of health. "The system of belief called Sacramentarianism is the prevailing and rapidly extending faith and practice of the clergy." "To be snubbed here and damned hereafter is the fate of the Dissenter." Those who object to this class of teaching are entitled, "without being called names," to agitate for the severance of the State from such a Church.

FRENCH AND ENGLISH PLAYWRIGHTS.

The recent quarrel of M. Sardou with Mr. Bancroft leads Mr. William Archer to write, with excellent candor, on "French Plays and English Money." He thus concisely puts the history of the relations between the British public and the French playwright: "Thirty years ago we stole his plays; fifteen years ago we paid extravagant prices for them; to-day we will scarcely accept them as a gift." The general demand for French plays in Eng-

land has enormously declined of late years because of their growth in subtle, and often objectionable, psychological analysis, and because English playwrights have vastly improved.

MR. WALTER CRANE AND THE CHICAGO ANARCHISTS.

Mr. Walter Crane chats pleasantly of impressions received during his recent trip to America. He finds that "the race for riches seems more all-absorbing" there than in the old country, and that the interest in social questions is not so keen. He tells how, after accepting an invitation to dinner at "a well-known Boston club," he took public part in keeping the anniversary of the death of the Chicago Anarchists, whose conviction he believed to be unjust. As a result, he "was asked to forego the dinner." At Wellesley College he dined with "300 young ladies who waited on themselves."

THE CONTEMPORARY REVIEW.

THE *Contemporary* starts the new year with an exceptionally valuable number. Professor Cunningham's discussion of "The Living Wage," Mr. A. Russel Wallace's Scheme for reforming the House of Lords, and Mr. Haweis' brilliant paper on the Mormons have been noticed elsewhere.

"LITERATURE AND LUCRE."

The Literary Conferences at Chicago are sympathetically described by Mr. Walter Besant, who deplôres the indisposition of literary folk to common action, and is specially roused by the superstition that a literary man is degraded if he considers the commercial value of his work. In producing it he is certainly an artist, but when it is produced he is rightly a merchant. "The patent facts of the case—viz., the great wealth acquired by successful publishers, the large number of existing firms, the continual addition of new firms, the magnitude of the figures when they are accessible—all prove beyond a doubt that literary property is now a very considerable item in the national wealth."

It is only just to ask what proportion of profit should be reserved by the author and conceded to the publisher. The Society of Authors demands, "1, Right of audit; 2, no secret profits; 3, the contract to make it clear what proportion of profits is assigned to either party."

Mr. Besant exults in the unprecedented audience open to the English man of letters—the whole English-speaking world being before him—and in the generally sound literature it demands.

HOW TO REVIVE FARMING.

Mr. Harold E. Moore criticises many current remedies for agricultural depression, and thinks that for the revival of farming in England "the practical course to be recommended at the present time appears to be that large farmers, by the use of improved machinery, more hand labor and high tillage, should raise increased crops, and that these crops should be of a nature best calculated to maintain dairy stock. Then those possessing only small capital with a knowledge of landed work, and willing to return to, or remain in, the country for a maintenance, should be assisted to gain their desire by local co-operative effort."

OLD AGE PENSIONS FOR TEACHERS.

Mr. W. A. Hunter, in a paper packed with most suggestive facts and figures, propounds a scheme for the superannuation of elementary teachers in England. He would exact from all teachers compulsory contribution of so much per cent. on all salaries up to a given maximum. School boards and school managers might be induced to

pay one-half of the necessary contribution. "Such a national scheme might be governed by a board, on which the teachers and the Education Department might be represented. The government would collect the premiums by deducting them from the education grant, and might assume responsibility for an investment of the fund."

OTHER ARTICLES.

Mr. Emerson Bainbridge tells from the coal owners' standpoint the oft-told tale of the strike of 1893. He points to competition from other coal districts at home and abroad in justification of the owners' action, and remarks that the Board of Conciliation agreed on in November if agreed to in July would have saved all this loss. Mr. Augustus Birrell writes of the Wolfe Tone—"a true humorist as well as a great rebel," and Dr. Geffcken paints the future of maritime warfare in gloomy colors so far as England is concerned.

THE NATIONAL REVIEW.

THE *National Review* for January contains several excellent and striking articles, of wide variety of interest. Mr. Cannan's proof of "The Decline of Urban Immigration" is reviewed in another department.

PLEA FOR PEOPLE'S BANKS IN ENGLAND.

Mr. T. Mackay puts his case for people's banks into a nutshell when he says: "It is proved by our Scotch banking system that a desert can be converted into a fruitful land by a judicious extension of credit to a comparatively humble class, and that German peasants can be rescued from the hands of the money lender by co-operative banking. It will be conceded that, *if possible*, similar facilities for advancing his position in life should be given to the artisan and to the agricultural laborer. . . . It is to be hoped that this matter will attract the attention of the Friendly Society and Co-operative leaders. They are, of all men, the most competent to lay the foundation of a new departure in the cause of thrift."

"HOW WE LOST THE UNITED STATES OF AFRICA."

This is the title of a very clever skit by Mr. F. E. Garrett on current criticisms of the Matabele war. It is supposed to describe what is to take place some years hence, when trouble with the natives is brewing in "the new gold-fields north of the Zambesi;" but the veil is very transparent which covers Mr. Flyte, whose editor has let him "run labor" in the *Courier*, Mgugu, the drunken African chief, the great monopoly and the necessary man. As a result of the tremendous popular agitation which Flyte beats up through the *Courier*, South African patience gives out: "At the convention from the three republics and the two colonies, which assembled forthwith, the Dutch king-maker's nomination of the necessary man as President of the United States was accepted with acclamation. The necessary man was not over-happy, for all the poetry that his practical head contained had centered through hard-working years in the world-wide empire. . . . But he set to work with characteristic promptness."

OTHER ARTICLES.

Lord Ashbourne, in a eulogistic retrospect of "W. H. Smith as a Colleague," mentions a singular prophecy of the old worthy uttered in 1889: "England is going to be governed by three classes of men—by roughs, by men of business and by those aristocrats who have heads on their shoulders and can use them."

Signed reviews of recent fiction by Lady Frances Balfour, the Hon. Mrs. Alf. Lyttleton, Miss Margaret Ten-

nant and Lady Constance Lytton mark a welcome tendency in English life. Mrs. Crawford narrates incidents in her autumn tour through North Italy. Mr. Harry L. Stephen takes occasion from a notice of the Featherstone report to review the older riots at Peterloo, Bristol and Newport.

THE FORTNIGHTLY REVIEW.

THE *Fortnightly Review* for January is an admirable number, full of information and suggestion, with every article touching a completely different side of life. Four of the most striking articles—"The Ireland of Tomorrow" according to "X," Captain Gambier's startling denial to Columbus of "The True Discovery of America," Mr. Coventry Patmore's appreciation of "Mr. Francis Thompson, a New Poet," and E. B. Lannin's "Triple Alliance in Danger"—find notice elsewhere.

THE CHEMISTS THAT LIVE UNDER SEA.

A highly instructive and interesting account of "The Chemical Action of Marine Organisms" is given by Professor Judd. All the known elements must be contained in solution in the sea, into which the Thames carries 2,000 tons of dissolved material every day, and all rivers together at the same rate would sweep a daily mass of 20,000,000 tons. The chemist is unable to detect the proportion or even the presence of the rarer elements. Yet these are taken up, secreted, or deposited by organisms vegetal or animal in the sea. Certain seaweeds contain a large quantity of iodine, of which analysis detects in sea water "the merest traces." Carbonate of lime, silica, phosphate of lime, salts of iron, though present in sea water in very minute quantity, are found in plenty in sea plants and animals. "All the observations that have been made in recent years upon the deposits of the ocean floor point to one conclusion—namely, that where materials have once passed into a state of solution in the waters of the sea they can only be separated from it in the open ocean by the wonderful action of living organisms."

A HINT FOR MILLOWNERS' DAUGHTERS.

Miss Bulley's paper on the Lady Assistant Commissioner's report on "The Employment of Women" is crammed full of facts and suggestions. "The conclusion to be drawn from the evidence is that wages of men and women correspond on the whole to their respective positions in the ranks of labor, and that the lower wages of women are due in nine cases out of ten to their inferior skill." In Lancashire men and women weavers are paid alike. The report disposes of the charge of "starvation wages." The majority of women earn less than 12s. a week. Shop assistants complain more of their lot than any other class. Many barmaids are total abstainers. Lancashire and Cheshire factories are sanitarily so defective as to foster immorality. Miss Bulley suggests that if wives and daughters of manufacturers were as familiar with factories and workers as their husbands and fathers, a great improvement would result.

IS LEPROSY CONTAGIOUS?

Dr. Thin strongly dissents from the report of the Leprosy Commission in India in its finding that the disease is rarely propagated by contagion. He adduces much evidence on the other side. He explains that leprosy is a parasitic disease. "A very minute vegetable organism inhabits the tissues of every leper, and by its slow and inevitable growth produces all the changes that eventually lead to the destruction of its host." This organism is found only in the human body, never in the lower animals. It enters through any break in the skin of a re-

ceptive subject. It is not hereditary. It has most rapidly disappeared where methods of isolation have been carried out. Such methods, at whatever cost, should be applied in India.

OTHER ARTICLES.

Mr. J. D. Bouchier discourses sympathetically on the career of Prince Alexander of Battenberg. Mr. L. B. Bowring reviews with eulogy Colonel Malleson's "History of the French in India," and vindication of Dupleix's greatness. "Creston" bewails the degradation of football from a sport to a trade. In the North of England it is nothing but the vastest and shoddiest of money-making concerns; £200 or £250 a year has often been given to an efficient player. He strenuously objects to the importation of mercenaries from distant parts to play a nominally local game.

THE NINETEENTH CENTURY.

THE chief attraction of the January number is Professor Huxley's beautiful tribute to his deceased comrade, which is as valuable for what it reveals of the writer as for what it tells us of Tyndall. After this unique and memorable contribution, a review of which will be found in the preceding department, we cannot complain that the rest of the articles, though as a rule bright and entertaining, are scarcely up to the average of eminence maintained by this review.

PARSEE ORIGIN OF THE CATHOLIC CREED.

Rev. Dr. L. H. Mills, "speaking from an orthodox point of view" on "Zoroaster and the Bible," calls attention to "the now undoubted and long since suspected fact that it pleased the Divine power to reveal some of the most important articles of our Catholic creed first to the Zoroastrians, and through their literature to the Jews and ourselves."

He traces resemblances or anticipations of Catholic doctrine in the Zoroastrian ideas of "the Seven Spirits of God," of the Creator, Sovereign, the kingdom of God, Satan, the fall, the virgin birth, the temptation, and pre-eminently of immortality and resurrection. He derives "Pharisee" from Farsee, Parsee, Persian.

"A NEW ERA IN CANALS."

The Manchester Ship Canal is described (with chart) by Lord Egerton of Tatton with a profusion of statistics and calculations. He quotes the saying of Voisin Bey, that "the difficulties of carrying out a canal through a highly populous and manufacturing district were much greater than those encountered in making the Suez Canal through a desert," and predicts that if the Manchester enterprise succeeds, "it will be the commencement of a new era in canals. All the large commercial centres will demand an improved system of canals for the transit of heavy goods. Sheffield and Birmingham will be among the first. . . . The whole subject might worthily occupy the attention of a royal commission."

HOW BEST TO EXPLOIT AFRICA.

Recognizing that "Europe has, for good or ill, taken possession of Africa in the name of Mrs. Grundy, Civilization and Company," but that when "divested of all philanthropic shams, the real mission of Europe in Africa is to turn that continent to profitable account for the benefit, not of the natives, but of their taskmasters," Mr. Arthur Silva White argues that the work can best be done by the agency of chartered companies, and that so long as they observe the stipulations of the charter they should have a free hand. If the companies are suppressed, foreign rivals will take their place.

SCRIBNER'S.

WE have quoted elsewhere from John Drew's article on "The Actor."

TURKISH HANDWRITING.

In the course of Mr. Marion Crawford's paper on "Constantinople," which city, by the way, is one of his pet localities, he tells of the peculiar attention which the Mussulmans have bestowed upon the art of beautiful handwriting. Indeed, one sect make it as profound a study as our artists do painting in the West. Mr. Crawford says:

"Beautiful calligraphy affords as much artistic delight as we could find in the pictures of the greatest masters. The European may in time familiarize himself with the Arabic character—which is a sort of shorthand—so as to read it as readily as the Latin or the Gothic. But he can never, I believe, learn to distinguish the artistic values therein which correspond to our ideas of drawing, color, light and shade. A Turk the other day pointed out to me a text from the Koran which hung upon his wall written in plain black upon a white ground. 'That writing,' he said, 'gives me as much æsthetic pleasure as you could find in any Titian.' Such specimens of caligraphic skill are often richly framed and preserved under glass, but some of the most beautiful of them all are found in the glazed tiles used in ornamenting the mosques and tombs. Some of these inscriptions are positively priceless in the eyes of the Turks, and they are rapidly becoming so in the eyes of the European collector, who, however, finds it almost impossible to obtain the smallest specimen of them.

THE PRINCE OF PORTRAIT PAINTERS.

A capital art article is Frederick Keppel's on Sir Joshua Reynolds, "the prince of portrait painters," as Ruskin calls him. We all know the personal Sir Joshua as the founder of the famous Literary Club, for the good company he kept, and as the quiet old bachelor comrade of Dr. Johnson, Edmund Burke, Boswell, Garrick and Goldsmith. Of his work Mr. Keppel says:

"Sir Joshua's zeal for improvement was insatiable. He never began a picture without resolving that he would make it a better one than he had ever painted before. One result of this ambition was that, in general, the quality of his work became better and better to the end of his life. But in one particular he certainly exercised a 'zeal, but not according to knowledge'; for having inherited from his father a taste for making experiments in chemistry, he applied it to the composition of his colors—sometimes with disastrous results. Thus I remember that twenty-five years ago his large Holy Family, in the British National Gallery, was in fairly good condition; but on revisiting it yearly it was easy to see that the cracks on its surface were growing more apparent, and that the picture was going to destruction. The last time I saw it it was worse than ever—and recently the picture has been removed from the walls altogether. On the other hand, the beautiful portrait of Lady Cockburn and her three children (painted in 1773 and recently acquired by the National Gallery) is now as fresh and glowing as it could have been when it first left the painter's easel."

ARE LITERARY FOLKS UNMUSICAL?

The editorial writer of the "Point of View" comments on the fact that the foremost literary men have, as a class, ever been unappreciative of or even averse to the sweet charms of music. He finds this out in the course of praising a New York literary club which gave up an entire meeting to the task of being entertained by a num-

ber of musicians. This writer points out that the brothers Goncourt confessed a dislike of it to Gautier, who in turn honestly declared that he hated it, that Balzac execrated it, that Hugo could not suffer it and that Lamartine held it in horror. To be sure there is to be put over and against these and others Milton and George Eliot, but still the "Point of View" writer thinks that literary folks are very lacking in the sense of sweet sounds and that they miss a great deal thereby.

THE CENTURY.

WE have quoted in another department from Miss E. B. Simpson's account of her father's discovery of chloroform, from Edward Green's article on Robert Schumann, Madame Blanc's paper on George Sand, and from Madison Grant's on the "Vanishing Moose."

LANG VS. HOWELLS.

In Mr. Brander Matthews' sketch of Andrew Lang he leaves no hope of a final reconciliation between the literary champions of Old and New England, Mr. Lang and Mr. Howells, a state of affairs which will not be received in America with any great degree of despair, since the mere state of war declared must be of more or less pleasant intent to our literary feelings. Mr. Matthews thinks:

"The ocean that surges between Mr. Howells and Mr. Lang is unfordable, and there is no hope of a bridge. There is no common standing-ground anywhere for those who hold fiction to be primarily an amusement and those who believe that it ought to be chiefly a criticism of life, as Matthew Arnold said all literature should be. The romanticist considers fiction as an art, and as an art only; while the extreme realist is inclined to look on it almost as a branch of science. Kindly as Mr. Lang may be in his reception of a realistic book, now and then, he stands firmly on the platform of the extreme romanticists. 'Find forgetfulness of trouble, and taste the anodyne of dreams—that is what we desire' of a novel, he declares in his cordial essay on Dumas."

MILITARY SUPERVISION OF OUR FORESTS.

An editorial writer in this number is not satisfied with pointing in horror to the rapid depletion of our forest domain, but goes on to make certain concrete suggestions for the final and elaborate work of saving the remnants. His schedule of reform would be as follows:

"First of all, instead of waiting for the proposal of separate forest reserves, the Administration should lose no time in considering what lands are left that may properly and profitably be so included. The great scenery should all be reserved for the people, and not left to fall into the hands of individuals. Any one who has observed how the Ohio and Mississippi valleys have suffered from forest denudation will not think this proposition premature. The next consideration should be how to guard and cultivate what shall thus be reserved. In a recent conversation of half a dozen persons who have given much attention to the subject, it was unanimously taken for granted that, in some way or other, effective control would be likely to be reached only through military supervision. This conviction is confirmed by the admirable management of the Yellowstone and Yosemite National Parks, which are in charge of officers of the army and patrolled by United States soldiers—in contrast to the conduct of the smaller Yosemite reservation by Boards of State Commissioners, which has not only been for years and is now a local scandal, but has awakened the official protest of no fewer than three special agents of the Land Office, as shown by Secretary Noble's report of December 29, 1892, to the Senate."

THE COSMOPOLITAN.

THE January *Cosmopolitan* is a pleasantly varied number. Mr. Howells' opening Altrurian letter, which deals with Central Park and its economic and social significance, we notice in another department.

MR. BOK TO YOUNG BUSINESS MEN.

Mr. Edward W. Bok, the enterprising young editor of the *Ladies' Home Journal*, gives a quantity of good advice on the subject of the "Young Man in Business," upon which, as surely one of the most successful young business men, he should speak with authority. Mr. Bok is optimistic as to the possibilities to any and all of our young men if they will only be a little more restlessly ambitious. He thinks the greatest danger to success is the disposition to be satisfied with doing a day's work. That is a good enough thing to do, says Mr. Bok, but it is not if a fellow wants to get on in the world. He thinks that every man should want to do more than a day's work; that he must be alert and he must show his employer that he knows more about the business than the employer himself. Mr. Bok says the hard-hearted boss is always willing or anxious to pay his helpers well. "Every employer would rather pay a man \$5,000 a year than \$500, for what is to the young man's interest is far greater to the interests of his employer. A five hundred dollar clerkship is worth just that amount and nothing more to an employer. A five thousand-dollar man is worth five times that amount to a business." Among other more concrete pointers Mr. Bok gives, he insists that a man cannot drink whisky and be in business, nor can he be "in society" and be in business, since plenty of sleep is one of the absolute requisites to success.

LONG DISTANCE RIDING IN AMERICA.

Captain Charles King, the novelist, tells, while on the subject of long distance riding, of some famous exploits in that line. Naturally most of these took place in the course of our Indian wars, which called particularly for frequent cavalry dashes. In one case, in military array and with all the accoutrements, Captain King and his comrades covered eighty-five miles in thirty-one hours without any mishap. On another occasion he tells of a column of cavalymen going one hundred and sixty miles over mountain trails between the noon of October 2 and dawn of October 5. Of course in cases of individual rides, much better time has been made. For instance, Lieutenant Rose's ride with dispatches one hundred and fifty miles over desert and mountain was made in twenty-four hours and an actual riding time of twenty-two and one-half hours, and this without any preparation or training of man or beast. Then there was Lieutenant Darlington, who, starting at sunrise on an August morning, covered fifty-five miles of the roughest country in the Northwest by noon, and by sunrise had come one hundred miles from his starting point with a mid-day change of mount. These and other instances which Captain King adduces, show that while we have not talked about it so much in the papers we are not far behind the achievements, so much published, of the officers of the German and Austrian armies last year.

ENGLISH AND AMERICAN HUMOR.

Miss Agnes Repplier is charming, as usual, in her paper on "Humor: English and American." She decides, and we believe that she can prove, that Americans have a keener sense of humor than have Englishmen, and she at least suggests that our humorists are more humorous than the English ones. "Whatever may be the case," says she,

"it is undoubtedly true that we treat Mr. Stockton with greater deference than England treats Mr. Anstey. We have illustrated articles about him in our magazines, and incidents of his early infancy are gravely narrated as likely to interest the whole reading public. Now, Mr. Anstey might have passed his infancy in an egg, for all the English magazines have to tell us on the subject. His books are bought, and read, and laughed over, and laid aside, and when there is a bitter cadence in his mirth, people are disappointed and displeased. England has always expected her jesters to wear the cap and bells. She would have nothing but foolish fun from Hood, sacrificing his finer instincts and his better parts on the shrine of her own ruthless desires and yielding him scant return for the lifelong vassalage she exacted. It is fitting that an English humorist should have recently written the most somber, the most heart-breaking, the most beautiful and consoling of tragic stories. Du Maurier has taught to England the lesson she needed to learn."

HARPER'S.

FROM the January *Harper's* we have selected the article on the "Mission of the Jews," by an unknown writer, "The West and East Ends of London," by Richard Harding Davis, and the "Bread and Butter Question," by Junius H. Browne, to review at greater length. The literary feature of this number is the first installment of Mr. George Du Maurier's new novel which he calls "Trilby," and which he profusely illustrates with his own pen drawings. Mr. Du Maurier is more than ever like his hero and master Thackeray in the style and the subjects which he chooses.

NAPOLEON AT TOULON.

There is an original paper by Germain Bapst on "Captain Napoleon Bonaparte at Toulon." Napoleon was then just twenty-four years of age, and in his difficulty to have a rather stupid superior adopt the plans which evidently were the only effective ones to defend the city, we find that even genius such as his does not have the first steps of its path entirely smooth. The writer gives this picture of Napoleon at that time:

"He was a short, well-proportioned man, with extremely thin dark hair, who wore a long cocked hat, not *en bataille*, or frontwise, as represented in the picture, but lengthwise (*i. e.*, one corner forward and the other behind, and, what was most peculiar, it had two black ribbons which, while the tips floated in the wind, were adjusted in a knot so as to hold the two rims of the corners together. His coat was blue, with velvet facings; his trousers were broad, and buttoned on each side of the leg from waist to ankle, a kind of garment then called a *charivari* or a *sur-culotte*; he had on small boots with yellow leather tops, and was covered all over with the dust of the road along which he had been walking; for he had just arrived from Avignon, whither he had escorted a convoy of ammunition, and was on his way to Nice."

THE MIDLAND MONTHLY.

THE first number of the *Midland Monthly* comes dated from Des Moines, Iowa. It is to be devoted especially to the literature produced by the writers of the Central States of the Union, and to subjects particularly affecting those sections. Naturally, Mr. Hamlin Garland's name is in its table of contents. Octave Thanet is another of its contributors, and it aims in general to fill a domestic want for good literature rather than to take to itself aught in the nature of an heroic mission.

M'CLURE'S MAGAZINE.

FROM the capital January number of *McClure's* we have selected three articles for more extended review: "A Thousand Miles in Twenty Hours," by Cy Warman; "Jules Verne at Home," by R. H. Sherard, and "Francis Parkman," by Rev. Julius H. Ward.

THE AIR SHIP AGAIN.

Much the best of the various "aerial navigation" literature which has appeared in the magazines during the past two years, is the account of the Maxim air ship by H. J. W. Dam. This gentleman invaded Mr. Maxim's comfortable quarters and extensive workshop near London, and describes to us in detail the actual ship which the inventor has now built. The most charming attitude of the new machine from the point of view of the prospective passenger is that, according to Mr. Maxim, it cannot fall with a velocity greater than a three foot drop would give, no matter from what elevation it starts, since after plunging that short distance the buoyant force about equals the force of gravity. Mr. Maxim speaks confidently of an eventual air voyage of three or four thousand miles. However, "The first machines are certain to be used for military purposes, whatever their cost or whatever the expense of running them, and the nation which first employs them will have every other at its mercy. I shall be quite content with my results when I can go a distance of twenty miles and back. That will suffice for all present purposes."

WHITTIER'S LACK OF AMBITION.

From the glimpses of the innermost life of Whittier given by his letters to Charlotte Fiske Bates, published in this number, he seems to have been curiously devoid of what we call ambition. This friend of the poet says:

"I have heard Mr. Whittier, true and great poet as he was, say that he never felt fully satisfied with anything that he wrote. He had, too, little or no concern as to posthumous fame; and, indeed, in mature life, at least, hardly any regard for present renown, in itself considered."

And Mr. Whittier himself tells her in a letter which refers to the desire for fame: "I had it strongest when I had no hope of it; and what I have attained has its drawbacks in the uncomfortableness of notoriety, in the necessity of keeping up to the standard of one's reputation, and, most of all, in the feeling that you don't really deserve what you get—that, unwittingly, you pass for more than you are worth."

ATLANTIC MONTHLY.

ONE notes that the *Atlantic* maintains its custom of presenting on a large proportion of its pages the story-telling work of the well-defined group of representative American woman novelists. In this number appear the first chapters of a new novel by Margaret Deland, a story by Sarah Orne Jewett, one by Mary Hartwell Catherwood and other chapters of Charles Egbert Craddock's story, "His Vanished Star."

THE UNIVERSITY AND LIFEWORK.

Professor N. S. Shaler talks, in a rather ponderous article, on "The Transmission of Learning through the University." Professor Shaler is optimistic in his views in discussing the work which has been accomplished towards fitting the university system to the public needs—in Harvard College through the Lawrence Scientific School and in other universities through like institutions. Then, too, he points to the elective systems of the Univer-

sity of Virginia and Harvard, which have enabled the student to combine his work of culture with the preparation for a calling. "It seems," says Professor Shaler, "certain that we shall enter in the next century on a college system which will lead men toward, rather than away from, the paths of professional duties." He thinks that there is no loss in the quality of culture of the best kind in this elective system, and he regards as an ideal academy the group of professional schools around an ordinary college—"the seat of what has been termed pure culture."

COLERIDGE ON PITT.

There are some striking sentences in "Ten Letters from Coleridge to Southey." We find Coleridge saying of Pitt: "He is a stupid, insipid charlatan, that Pitt. Indeed, except Fox, I, you, or anybody might learn to speak better than any man in the House."

This is *à propos* of reporting Pitt's speech for the *Morning Post*, on whose staff Coleridge was. Then we find him busy with Duns Scotus—

"And in order to wake him out of his present lethargy, I am burning Locke, Hume and Hobbes under his nose. They stink worse than feather or asafetida. Poor Joseph!"

—and chuckling over the "stupid, haughty fool," the librarian of the Durham Cathedral library, who imagines that Leibnitz is a species of animalculæ—"live nits!"

THE SOUTHERN MAGAZINE.

THIS monthly has with some reason chosen as its holiday month January instead of December, which is the Christmas date of all the better known magazines, and which brings out the Christmas number of *Harper's*, for instance, considerably over a month before Christmas. The *Southern Magazine* has one of the most tasteful of the holiday number covers in green and white and gilt, and it is a most creditably illustrated monthly, vying with the great New York magazines in the quality and excellence of half-tone illustrations. As its name would indicate, its list of subjects and of writers pertain especially to Southern things and men.

The more serious paper of this number is on "The South in the Intellectual Development of the United States." Mr. William Baird, who contributes this, takes exception to Mr. Lodge's recent statement in the *Century* as to the small share which the South might claim in the distribution of ability throughout the United States, which alleged phenomenon Mr. Lodge naturally attributes to slavery principles, notwithstanding the fact that the Massachusetts senator is backed up by Appleton's *Encyclopædia* and the *Britannica*. Mr. Baird examines his statement concerning Southern genius in detail and

brings many noble names to support his side of the case. He thinks that when the South has named Washington, Jefferson, Henry, Jackson, Pope and Lee, it is already well on to proving its claim.

Harriet C. Cooper is loud in her condemnation of having commencements, especially in girls' schools. She contends that the exercises of those time-honored institutions are only for show and to please the audience, and that the best schools do not show up best, and she thinks that the excitement and attention of the preparation for these grand finals of the school year are largely to blame for the harm which comes to the health of school girls. If educational conservatism will not allow anything better, she begs that commencements be brought down to one day.

THE CHAUTAUQUAN.

"UNIVERSITY SETTLEMENTS," by S. A. Barnett, is given an added interest from the fact that the author has been identified with the movement from its very inception and knows whereof he speaks. He says, "settlements have been started as a protest against philanthropic machinery;" they must be self-supporting; they must be hide-bound to no creed or cult, have no object to gain; they must labor for the community, not for any class. Every man should take his part, however small, in the work, and "he is the best resident who makes the truest friend." Bishop Vincent wanders back into the conventional, well-trodden paths "In Italy," through Pisa, Milan, Florence and Rome. Professor Mall, of Johns Hopkins, in a brief notice of the many sciences which form the composite of the great science of life, gives an answer to the question, "What is Biology?"

Professor Boyesen tells the story of his fellow countrymen, the latter-day Norsemen's trip across the Atlantic, in his "Voyage of the Viking." The article is illustrated by views of the famous little vessel. There is nothing so characteristic of a man as his will in the general run, and for proof of the assertion the reader is invited to turn his attention to Dr. Biddle's article on "Wills of Some Rich and Famous People." Reading between the lines, the whole character of the man is unfolded.

THE ARCHITECTURAL RECORD.

THE classic design of this able class quarterly is printed in the Christmas number in striking tints of orange and cream; and in the text pages of the magazine there are numerous colored pictures of subjects which pertain to this field. Indeed, it makes one of the most elaborate attempts at color printing that we have noticed in the magazines for a long time. *The Record* has its usual carefully selected array of articles on technical phases.

THE FRENCH REVIEWS.

THE REVUE DES DEUX MONDES.

THE December *Revue des Deux Mondes* contains two important articles, "The Transformations of Diplomacy," by an anonymous writer, and a lengthy account of "The Rise of Old and New Epidemics," by M. A. Proust, of the French Medical Academy, both of which are noticed elsewhere.

PEOPLE'S BANKS IN ITALY.

The most interesting passage in M. Paul Leroy-Beaulieu's third article on "Co-operation" refers to the Ital-

ian credit banks, founded by the people, "thanks to the ancient spirit of association among Italians." In Germany similar institutions are more under the control and advice of the richer financial classes; in Italy they appear to have sprung partly from the savings banks, which enjoy great liberty of investment. The foundation of the first "popular bank," in 1866, was due to M. Luzzati, and was laid at Milan. It began with a very modest capital, the sum of \$150; the shares being \$10 each, the payment spread over several months. This bank now occupies a large building, and employs at least 130 paid functiona-

ries, 100 clerks, and has more than 17,000 members. It pays a high dividend, like the numerous other banks founded on the same model.

THE LIFE OF FRENCH MINERS.

In addition to the concluding article on "The Transformations of Diplomacy," and M. Jusserand's curious account of "The Mediæval English Theatre and Drama," noticed elsewhere, the most notable contribution to the second number of the *Revue des Deux Mondes* deals with the strike of the miners in the north of France. From the description given by M. de Calonne, it does not appear that the French miner is any better off than his English brother. But he entirely denies the truth of Zola's terrible picture in "Germinal"—that is to say, as regards the character and morals of the men. "The working miner," he observes, "is as a rule a worthy kind of man, very courageous, a very good husband and father. His home, where often some ten or twelve children may be found, is clean and comfortable, and the wife manages to look and dress well on the large wages earned by 'her man.'" The miners' families eat meat every day, in agreeable contrast to the peasantry, who can barely afford meat more than once a week; though beer is often taken, coffee remains the French miner's favorite beverage. During the last fifty years the French miner's wage has more than quadrupled, and according to this writer they should have remained content; for he points out that the late strike, so far from being beneficial, was very injurious to the workers' cause.

THE NOUVELLE REVUE.

M. Richard contributes a pleasant account of a journey in Thessaly, the largest district of ancient Greece; his description of Rigas, the great Greek patriot who lived during the eighteenth century, being specially interesting. Even to this day both Rigas' speeches and the verses he composed on the subject of Greek independence are sung and recited in the mountains by the peasantry. This patriot saw the beginning of the present century, and had at one time a long correspondence with the young Bonaparte. He died as have died so many men of his type; arrested at Trieste by the Austrians, he was given over to the Turks, who were ordered to drown him in the Danube, but while making a desperate attempt to escape he was shot down, crying as he staggered back; "Come on, and see how die the Palikares," adding, "I have sown the seed; my countrymen will soon reap the harvest!"

The same number contains a short sketch of Søren Kierkegaard, the Danish moralist and author. This remarkable man was born at Copenhagen in 1813. He and his brother (late Bishop of Aalborg) were the sons of a peasant who had made his fortune in the wool trade, and then retired to Copenhagen, where he led a quiet, austere life, bringing up his two sons according to his own theories, and entertaining the few friends he still saw with his views on morality and religion. During the whole of Kierkegaard's life he remained strongly influenced by his father's ways of thought, and many of his writings, treating of religion and morality, might easily be delivered as sermons, and this, although he was extremely severe on the faults, not to say vices, of the Danish clergy, whose conduct and life he stingingly contrasts with that of their master, Jesus Christ. Not only the clergy but the whole of the Danish society of his day feared the writer of these powerful diatribes, and for a time at least he enjoyed no credit in his own country. Søren Kierkegaard lost his father at the age of twenty-seven. He had no: at that time written anything, but he was known and respected as a severe Doctor of Divinity, and great was the

surprise of his friends to hear of his engagement to a charming though somewhat commonplace young girl. The whole history of their strange betrothal is told in the most remarkable of his works, "Guilty or Not Guilty," an extraordinary psychical study, and which contains all the author's theories on marriage, theories which he repeated in many of his other works. His own romance ended sadly, and he lived and died a bachelor, spending his last days in a hospital, and this although he had once declared that marriage was and would always remain the most perfect state.

The second number of the *Nouvelle Revue* is exceptionally strong, and can boast of a number of excellent articles; yet we cannot but notice that Madame Adam gives more and more prominence to political and military subjects both as regards ancient and modern history.

The *Revue* opens with what promises to be a curious and valuable addition to Napoleonic history—namely, R. A. Gagnière's "Pius VII and Napoleon II," the manuscript of which the author left by will to the editress of the publication in which it now makes its first appearance. A striking and hitherto unpublished account of the seizing of the Vatican and arrest of the Pope is quoted. The delicate negotiations had been intrusted by Napoleon to General Radet, and the latter accomplished the mission so well that in spite of the formal protests uttered by Pius VII, in less than an hour and a half the Pope and his faithful companion, Cardinal Pacca, were being driven rapidly out of Rome, their united funds amounting to the modest sum of sixteen pence, which caused the Pope to remark that in future he would have the right to say that he had once traveled as a simple pilgrim. Cardinal Pacca, of whom a vivid portrait is drawn, was soon separated from his master and imprisoned in the Fenestrella fortress, where he spent four terrible years, till after Napoleon's forced reconciliation with Pius VII at Fontainebleau he had reluctantly to give an order for his release. Strange, indeed, is the description of the fatal journey through southern France. Even at Tarascon, a Huguenot centre, Catholics as well as Protestants, nobles and peasants, all turned out to do honor to the old man who was being brought as a prisoner in their midst, and at last, after a long journey, accomplished in a litter along the mountain road made by the Romans round the Corniche, the Pope and his small retinue arrived at Savona on August 17, 1809, where he remained during the next two years, Napoleon I having decreed that Pius VII was to spend the following two years there.

M. Hugues le Roux describes a journey he made last summer to Norway, and he seems to have been most struck when in the land of the fiords by the Japanese aspect of both country and buildings. As regards Christianity, Bergen and other Norwegian towns, he, as a Frenchman, was impressed by their newness. Trondhjem, he observes, has been burnt to the ground fifteen times in three hundred years; and soon these cities of the north will boast of palaces of stone and marble, for wood as building material is being made illegal, owing to the terrible fear of fire. M. le Roux kept a diary each day of his voyage, writing his notes on steamer, railway, and even horseback, and thus his descriptions of Norway and Norwegians are more vivid than most books of travel.

An anonymous article deals with the Christianity of Pierre Loti, the well-known novelist. In the latter's lately published story, "Matelot," he concludes the volume with a religious hymn which has been much noticed, and in this article his critic attempts to prove his hovering on the brink of belief, which he had apparently abandoned, in a future life.

THE NEW BOOKS.

RECENT AMERICAN PUBLICATIONS.

HISTORY, BIOGRAPHY AND ECONOMICS.

A History of Chile. By Anson Uriel Hancock. Octavo, pp. 471. Chicago: Charles H. Sergel & Co. \$2.50.

Charles H. Sergel & Co., of Chicago, are at present issuing a series of volumes treating of the history, government and national peculiarities of the Latin-American Republics. In this series the second volume is devoted to Chile, and is written by Anson Uriel Hancock. There have been recently a number of books giving in English a more or less full account of certain periods and episodes in Chilean history, but Mr. Hancock's work, though it dwells at length upon recent occurrences and doubtless has its *raison d'être* in the newly awakened interest in South American affairs, covers the whole story from the Spanish invasions to the present time. Its parts are devoted respectively to "The Colonial Period," "The Revolutionary Period," "The Era of Constitution Making," "The War with Peru and Bolivia," "Balmaceda and the Civil War of '91," and "Chile of To-day." This outline reveals an important attempt, and Mr. Hancock has apparently succeeded in making the attempt result in an important book. It is a serious and needed contribution to our knowledge of a sister republic. Besides the text there is valuable material in maps, illustrations, bibliography and the appended constitution of Chile.

History of England and the British Empire from B.C. 55 to A.D. 1892. By Edgar Sanderson, M.A. Octavo, pp. 1133. New York: Frederick Warne & Co. \$3.

Though adapted for certain classes of general readers Mr. Sanderson's outline of British history is designed mainly for students in schools and colleges. The narrative, clearly and simply written, begins with the time of Julius Caesar, though the author has not dwelt to any extent upon the Celtic or Anglo-Saxon period; "Book Four" the "Coming of the Normans," beginning on page 69. Mr. Sanderson brings the record down to 1892, and throughout has aimed at a comprehensive treatment of progress not only in constitutional history and British dominion, but in art, science, literature, commerce and discovery as well. The people have not been considered as a mere background for the actions of sovereigns. In so extended a volume it is impossible that all slight inaccuracies should be excluded; in American history, for instance, Mr. Sanderson gives June 18 as the date of the battle of Bunker Hill, and his "nearly 4000 soldiers" as an estimate of the army which Burgoyne surrendered to Gates is perhaps an underestimate. The typography of the book is clear, the binding substantial, the index, table of contents and chronology, genealogical tables, maps and marginal topics seem reliable and serviceable.

Russia and Turkey in the Nineteenth Century. By Elizabeth Wormeley Latimer. 12mo, pp. 413. Chicago: A. C. McClurg & Co. \$2.50.

In "Russia and Turkey in the Nineteenth Century" the author has followed the same general method as in her previously issued "France in the Nineteenth Century," the kind reception of which gave a stimulus to the preparation of the new volume. The reader will find in these pages a carefully made, thorough-going account of the main events in the military history of the two countries, and of the characters and vicissitudes of their sovereigns. The portions devoted to constitutional struggles and to the progress or situation of the masses of the people are comparatively small. The history is furnished with something more than a score of portraits.

The Story of Japan. By David Murray, Ph.D., LL.D. 12mo, pp. 441. New York: G. P. Putnam's Sons. \$1.50.

The last issued volume of the extended "Story of the Nations Series" is from the pen of Dr. David Murray, whose preparation for writing of Japan included not only careful study of Japanese history, but a residence of several years among the Japanese people. His account begins with the period of myths and legends and continues to the establishment of constitutional government in 1889. The important part which our Commodore Perry played in the opening of Japan to modern influence and the many close relations since

that time between Japan and America naturally make this volume one of the most interesting and timely of its series. The maps, illustrations and other supplementary matter are well prepared.

Historic Green Bay. 1634-1840. By Ella H. Neville, Sarah G. Martin and Deborah B. Maryin. 12mo, pp. 285. Green Bay, Wis.: Published by the Authors. \$1.25.

Green Bay is historically one of the most interesting towns of the Northwest, and it is fortunate that a careful and adequate account of the life which centred there from 1634 to the organization of Wisconsin as a Territory has now been written. This sketch is an entertaining one, well illustrated, and the fact that the introductory note by Mr. Reuben Gold Thwaites is a commending one and a sufficient guarantee for the reliability of the volume. Mr. Thwaites also revised the MS. and prepared the valuable index.

Leonidas Polk, Bishop and General. By William M. Polk, M.D., LL.D. In two vols., 12mo, pp. 359-442. New York: Longmans, Green & Co. \$4.

A recent contribution to the accumulating volumes which record the parts played by the military leaders of each side in the Civil War is a memoir by Dr. W. M. Polk of his father, Leonidas Polk. The author's interest attaches largely to the personality of Bishop Polk, but the second volume is a military history of considerable general importance, and the peculiar position of Polk as ecclesiastic and general has a marked dramatic value. The subject of widest bearing in the first volume is the labor of Bishop Polk in the founding of the University of the South (at Sewanee, Tennessee). The portraits, maps, index, various appendices, etc., are carefully prepared, and Mr. Polk has written in a dignified, attractive style, drawing very largely upon his father's private and official correspondence for the narrative.

The Romance of an Empress. Catherine II of Russia. Translated from the French of R. Waliszewski. 12mo, pp. 466. New York: D. Appleton & Co. \$2.

Catherine II of Russia is one of the most fascinating and brilliant woman who had a part to play in the affairs of Europe in the eighteenth century. Mr. Waliszewski's account of her as duchess and as empress is based upon a research of official and private documents, which discovered much new material. The translation of his work has historical value, while at the same time it dwells with most zeal upon the personal and romantic elements in Catherine's career. It apparently deserves a place beside the numerous recent issues which have portrayed for us the brilliant French women of the last and earlier centuries. The frontispiece is an attractive portrait of the empress.

The Spanish Pioneers. By Charles F. Lummis. 12mo, pp. 292. Chicago: A. C. McClurg & Co. \$1.50.

Mr. Lummis is a worker in the field of the Spanish occupation of America, following the general method and spirit of the historical scholar, Mr. A. F. Bandelier. Mr. Lummis has already written several books in reference to people and events in the Spanish Southwest of the United States. The heroes whom he introduces in his last issued work are many of them unfamiliar to our young people; the author believes that the school histories do not generally present a fair and accurate account of these men. The stories of Vaca, Coronado, of the less strange Pizarro, etc., are instructive and entertaining, and the text is aided by a number of good illustrations. With such books as this in hand, young readers ought not to find history "dry."

Authors and Their Public in Ancient Times. By George Haven Putnam. 12mo, pp. 326. New York: G. P. Putnam's Sons. \$1.50.

Mr. George Haven Putnam's prominent part in the recent enactment of the "International Copyright Law" and in

the discussions of many years which preceded this most important legislation is well known. Mr. Putnam is not only interested from a practical and ethical standpoint in the subject of literary property, but he is a careful student of its history. In "Authors and Their Public in Ancient Times" he presents a study of the gradual evolution of definite business relations between the producers and consumers of literature, in ancient Greece and Rome, with some attention to even earlier data. This volume, which is intended as an introduction to a forthcoming one treating of the same subject down to our day, will be of interest and value to almost any reader seriously concerned with the history of books.

The Diary of Samuel Pepys, M.A., F.R.S. Edited by Henry B. Wheatley, F.S.A. Vol. III. 12mo, pp. 371. New York: Macmillan & Co. \$1.50.

The third volume of Mr. Wheatley's new edition of the famous diary of Pepys contains the record for the year 1663. The illustrations are a portrait of Pepys from Sir Peter Lely's painting and a portrait of Sir Samuel Moreland. The volumes of this edition have the substantial and pleasant appearance which befits them as belonging to Bohn's "Historical Library."

The Cincinnati Southern Railway: A Study in Municipal Activity. By J. H. Hollander. Paper, 8vo, pp. 116. Baltimore: Johns Hopkins Press. \$1.

Among recent issues belonging to the "Johns Hopkins University Studies in Historical and Political Science" is a monograph by Mr. J. H. Hollander, a Fellow of the University, upon "The Cincinnati Southern Railway." This railroad was completed from Cincinnati to Chattanooga early in the year 1880, after considerable legislation and litigation. The municipality of Cincinnati constructed and controlled the line and the economic importance of Mr. Hollander's paper rests in the light this enterprise throws upon the general problem of the province of city government, its relation to the action of State legislation, the effect upon municipal finance of undertaking so large a task as the building of an extended railroad and questions of a similar nature. The author of this study believes that the history of the "Cincinnati Southern Railway" affords forcible illustration of the danger to which, with the marked variety and quick change of modern industrial life, a local body may by a . . . [rigid legislative] limitation be exposed."

The City Government of Philadelphia. A Study in Municipal Administration. With an Introduction by Edmund J. James, Ph.D. Octavo, pp. 300. Philadelphia: Wharton School of Finance and Economy. \$1.50.

The chapters of this volume devoted to the Quaker City are the results of investigation by the thirty young men composing the class of 1893 in the "Wharton School of Finance and Economy." The whole field of the work done by the city government of Philadelphia is carefully covered, though with necessary brevity, and the book might well serve not only as in itself an interesting study of existing methods in municipal administration, but as a stimulus to other schools to prepare, in similar manner, a résumé of the actual working of the great city which happens to be nearest at hand.

PHILOSOPHY AND SCIENCE.

The Civilization of Christendom, and Other Studies. By Bernard Bosanquet. 12mo, pp. 383. New York: Macmillan & Co. \$1.50.

The object of "The Ethical Library," edited by Mr. J. H. Muirhead, in which the newly issued collection of studies by Mr. Bernard Bosanquet finds its place, is not a systematic presentation of morals as science. The aim is rather to examine in the light of modern method and result "questions of the inner and outer life that have been too much the monopoly of the theologian," and to deal with these problems "from the point of view and in the spirit of the student of philosophy." Mr. Bosanquet is one of the more prominent English leaders in what is known as the Ethical Culture movement, whose ablest exponent in our land is Professor Felix Adler. It is but fair to say that the individual beliefs and theories of the thinkers in this movement are not of a uniform nature, though there is a large basis of common ground. The author of these studies has advanced beyond the standpoint of Agnosticism, deeming it wise that we should not even deny a knowledge of an extra-human world, because it does not concern us closely enough to merit a denial; "for us the Unknowable is and must be nothing, and . . . our business lies with the life and with the good that we know and with what can be made of them." In

this spirit, which finds reality in the life of men and women upon the earth, and with a strong sense of historic inheritance and a firm belief in the "solidarity" of our race, Mr. Bosanquet writes his calm and clearly written chapters upon "The Future of Religious Observance," "The Civilization of Christendom," "Right and Wrong in Feeling," "Individualism and Socialism," and other kindred topics.

The Psychic Factors of Civilization. By Lester F. Ward. Octavo, pp. 390. Boston: Ginn & Co. \$2.

Mr. Ward's elaborate and systematic treatise is based upon an expansion of certain ideas which he advanced in "Dynamic Sociology," a work published some ten years ago. In his introduction the author gives us this bit of analysis, which will serve to indicate more or less distinctly the scope of the book's purpose: "1. The phenomena of subjective psychology, viz., the feelings, taken collectively, properly called the soul of man, constitute the dynamic element of society, or the social forces; 2. The initial, original or primary characteristic of objective psychology, viz., the intellect proper or intuitive faculty, constitutes the directive element of society, and only means by which the social forces can be controlled." Mr. Ward's aim, therefore, is simply to build up a true science of sociology upon the ground work of an accurate psychology; and he holds the belief that the true solution of the problems of modern social organization is found only in "the day light of science," a subversion of the reign of the individual and the inauguration of a form of government which in his concluding chapter the author denominates "Sociocracy."

A History of Philosophy. By Dr. W. Windelband. Octavo, pp. 672. New York: Macmillan & Co. \$5.

This good-sized volume takes its place among the solid and important philosophical works which Macmillan & Co. publish. It is an authorized translation, by Dr. James H. Tufts, of the University of Chicago, of a German work designed as a serious text book, with the definite aim of treating the formation and development of philosophical problems and conceptions, minimizing the literary, biographical elements. Greek and Hellenistic-Roman thought is treated at length, and some seventy-five pages are given to mediæval philosophy. The period from the "humanists" to the present time occupies the last three hundred pages, or about half the work. The translator believes that Professor Windelband's history "awakens an interest that is greater in proportion to the reader's acquaintance with other works on the subject."

Primer of Philosophy. By Dr. Paul Carus. 12mo, pp. 238. Chicago: The Open Court Publishing Co. \$1.

Dr. Carus' preface informs us that he here "means by Primer a presentation of the subject in the plainest and most lucid form in which he could print it." The author believes that a new era of influence is opening up for philosophy in which its results shall be based upon experience—which in the widest generalization is science. Dr. Carus' style is clear; he has kept as free as possible from antiquated technical terms, and has explained those employed. His aim in this volume is in the main "a critical reconciliation of the rival philosophies of the type of Kantian Apriorism and John Stuart Mill's Empiricism."

Genetic Philosophy. By David Jayne Hill. 12mo, pp. 395. New York: Macmillan & Co. \$1.75.

The essays of Mr. Hill's volume are clear-cut and able discussions in a philosophic method, and upon the basis of modern biological and physical science, of the genesis of matter, life, consciousness, feeling, thought, art, morality, etc. The book is as a literary as well as a philosophical value and in itself illustrates the "genetic method," which "consists in referring every fact to its place in the series to which it belongs."

A Theory of Development and Heredity. By Henry B. Orr, Ph.D. 12mo, pp. 264. New York: Macmillan & Co. \$1.50.

Certain scientists of our day are attacking the old-time view of hereditary influence as an important factor in molding the individual. Doctor Orr, who is professor in Tulane University (New Orleans), does not so interpret the facts which recent biological investigation has accumulated. Throughout his chapters upon "Limits of Natural Selection," "Action of the Nervous System," "Origin of Variation," etc., etc., a belief in the potency of both heredity and environment manifests itself. His theory, not revolutionary, but based upon the broadest generalizations of natural science, explains heredity by the psychical properties of living matter and finds no place for any chance force among the agencies of development, which is a series of necessary causal connections.

Romance of the Insect World. By L. N. Badenoeh. 12mo, pp. 359. New York: Macmillan & Co. \$1.25.

The matter and spirit of this little volume are thoroughly scientific, though it is well fitted to be a popular book upon the interesting branch of natural history of which it treats. The author's data are drawn both from personal observation and from the recorded observation of others. There are chapters upon "The Metamorphoses of Insects," "Food of Insects," "Hermit Homes," "Social Homes," and "Protection as Derived from Color." A glossary explains the necessary technical terms and more than fifty illustrations accompany the text. The book is of British origin.

Search Lights and Guide Lines; or, Man and Nature, What They Are, What They Were, and What They Will Be. By Edgar Greenleaf Bradford. 16mo, pp. 103. New York: Fowler & Wells Co. 50 cents.

Mr. Bradford's observations are of a semi-philosophical nature, clearly written, and give us glimpses of life from the standpoint of a student and believer in phrenological science.

RELIGION, THEOLOGY AND BIBLICAL CRITICISM.

Jesus and Modern Life. By M. J. Savage. With an introduction by Prof. C. H. Toy. 12mo, pp. 230. Boston: George H. Ellis. \$1.

Mr. Savage's present volume is a contribution to the critical discussion of the essentials of Christianity and the true position in religious thought of its Founder. In more detail, the preface defines a three-fold purpose: To find "the actual beliefs and teachings of Jesus;" to place this teaching in its relation to the preceding thought of the world and specially to that of the Jewish people, and to determine how much of Christian doctrine "is vital to-day, and how it bears on the problems, religious and other, with which we must deal." Mr. Savage's own view, as shown in these sermons and as revealed in his frequent writings, is that of reverent but advanced Unitarianism. In his introduction Professor Crawford H. Toy, one of the foremost students of historical elements in religion, assures us that the author is "in the spirit and the general results of his critical analysis of the gospel narratives . . . at one with the best modern authorities."

The New Bible and Its New Uses. By Joseph Henry Crooker. 16mo, pp. 286. Boston: George S. Ellis.

We remember hearing a sermon some few years ago by the Rev. T. K. Beecher upon the theme of a precious gift conveyed in an earthen vessel. The preacher conceived of the Bible as such a vessel, imperfect in itself and yet vastly important because of its contents. This view of the Bible is that which prevails in Mr. Crooker's pages. The author does not sympathize with the worship of a book, and he devotes a large portion of his space to an examination of errors in the Bible and to a statement of the fields of thought and knowledge in which it can no longer be considered authoritative. He believes, however, that the new uses of the Scriptures compensate for the loss of the old, and that the Bible "will live as long as humanity lives," as a religious classic and "an aid to our own spirit to make more audible and persuasive the voice of the living God, in whom we, as well as Isaiah and Paul, live, move and have our being."

The New Testament and Its Writers. Being an Introduction to the Books of the New Testament. By Rev. J. A. McClymont, B.D. Octavo, pp. 288. New York; Anson D. F. Randolph & Co. \$1.75.

The Rev. J. A. McClymont is a clergyman of the Church of Scotland, and it is as such that he examines "The New Testament and Its Writers" in a volume which aims to be of service to ministers and other readers of the Bible. He notices each book separately, treating of such points as its authorship, date of composition, general character and the like. An appendix gives a brief summary of the literature of the Fathers of the Church, and a map locates most of the places mentioned in the text. There are also notes upon English versions of the New Testament, the canon, textual criticism, etc., *fac-similes* of portions of ancient codices and a photograph of an ancient Syriac palimpsest.

The Old Testament and Its Contents. By James Robertson, D.D. 16mo, pp. 162. New York: Anson D. F. Randolph & Co. 30 cents.

In somewhat the same manner as obtains in the volume just noticed, Professor James Robertson, D.D., of the University of Glasgow, analyzes the books of the Old Testament.

The manual is designed as a species of textbook and finds place in the "Gould and Bible Class Series" edited by two divines of the Church of Scotland.

Supernatural Revelation: An Essay Concerning the Basis of the Christian Faith. By C. M. Mead, D.D. 12mo, pp. 484. New York: Anson D. F. Randolph & Co. \$1.75.

There comes to our desk a second edition of a series of theological lectures delivered before the students of Princeton by Dr. C. M. Mead, who holds the professorship of Christian theology in Hartford Theological Seminary (Connecticut). Professor Mead seems somewhat impatient of the so-called "higher criticism," and his view of miracles, inspiration and kindred questions would probably appear conservative to many present-day thinkers. His chapters are those of an earnest and scholarly student, who is a firm believer in the fact and authority of a revealed religion.

The Christian View of God and the World, as Centering in the Incarnation. By James Orr, D.D. Octavo, pp. 537. New York: Anson D. F. Randolph & Co.

Dr. Orr is the incumbent of the chair of church history in an Edinburgh college, under the auspices of the United Presbyterian denomination. The general purpose of his lectures is to define the Christian view of the world—"Weltanschauung" in the German terminology—which, according to the author, "stands in marked contrast with theories wrought out from a purely philosophical or scientific standpoint," and is also not entirely consonant with our prevalent modern conceptions of sin, incarnation, immortality, heaven, hell, etc. The lectures have a technically theological and philosophical basis, as abundant notes testify, but are themselves written in a rather easy though systematic style.

Natural Theology: The Gifford Lectures, Delivered before the University of Edinburgh in 1893. By Prof. G. G. Stokes. 12mo, pp. 280. New York: Macmillan & Co. \$1.50.

The general position of Professor Stokes in these lectures, which were delivered last year before the University of Edinburgh, may be determined by a sentence occurring in the last chapter: "Any divorce between natural theology and revealed religion is, in my opinion, to be deprecated." Professor Stokes discusses the idea of "design" in some of its numerous applications, chemical, physical and physiological, the theory of evolution, the Christian doctrine of revelation, the primary condition of man, immortality and kindred topics, treating all in a candid spirit and in a clear, incisive style.

Heart-Beats. By P. C. Mozoomdar. 12mo, pp. 330. Boston: George H. Ellis. \$1.50.

Mr. S. J. Barrows, in his biographical sketch of some length prefixed to this series of "Heart-Beats," affirms that the volume is "the most remarkable devotional book since that of Thomas à Kempis." Whether that statement be too strong or not, the high position of Mozoomdar among present religious thinkers and the great interest awakened by his recent visits to the United States guarantee a wide reading for this selection of his meditations. The style is as vigorous and sensitive as the thought is profound and spiritual, and both are under bondage to a genuine experience. The volume contains a portrait of Mr. Mozoomdar.

Seven Great Teachers of Religion. A Series of Sermon-Lectures. By Jenkin Lloyd Jones. Paper, 12mo. Chicago: Unity Publishing Co. 10 cents each.

In each of these admirably clear pamphlets Mr. Jones considers the biography of a great religious leader and the system of religious truth which he founded or the aspects of the religious life which he seems to particularly emphasize. The search in these pages is not for scholarly knowledge, but for a wider revelation of the spiritual life and a stimulus to noble morality. The leaders whom Mr. Jones has chosen are "Moses, the Hebrew Law Giver;" "Zoroaster, the Prophet of Industry;" "Confucius, the Prophet of Politics;" "Buddha, the Light of Asia;" "Socrates, the Prophet of Reason;" "Jesus, the Founder of Christianity," and "Mohammed, the Prophet of Arabia."

The Aim of Life: Plain Talks to Young Men and Women. By Philip Stafford Moxom. 12mo, pp. 300. Boston: Roberts Brothers. \$1.

Mr. Moxom, who is a Baptist clergyman of Boston, has brought together a series of addresses to young people upon "Character," "Habit," "True Aristocracy," "Ethics of Amusements," and other kindred topics. The chapters are marked

by a high moral purpose and a direct, vigorous utterance. The "Aim of Life" is a very helpful book to place in the hands of any young man or woman.

Sabbath Hours. Thoughts by Liebman Adler. 12mo, pp. 350. Philadelphia: Jewish Publication Society of America.

"Sabbath Hours" contains fifty-four sermons preached by the late Rabbi Liebman Adler to his Jewish congregation in Chicago. They are calm and conservative, Hebrew to the core, but though based upon Pentateuchal texts are pervaded by a good deal of the modern spirit, and are applicable in their essential meaning to the modern religious needs of Gentile as well as Jew. In style they are eminently clear and direct. A portrait and a brief biographical sketch of the rabbi accompany the sermons. The book is issued by the "Jewish Publication Society of America," which apparently has an important future.

The First Communion: Before, At, After. By Henry M. Booth, D.D. Paper, 12mo, pp. 94. New York: Anson D. F. Randolph & Co. 40 cents.

Dr. Booth is a Presbyterian clergyman, and in "The First Communion" he interprets in simple language the meaning of that rite and gives suggestions as to the methods by which one can reap from it the highest spiritual advantage.

Theosophy or Christianity, Which? A Contrast. By Rev. I. M. Haldeman. 12mo, pp. 52. New York: Croscup Publishing Company. 50 cents.

The Rev. I. M. Haldeman is pastor of the First Baptist Church of New York City. He has issued in the form of a booklet a sermon in which he draws a contrast between his conception of Theosophy and his conception of Christianity. The former he considers "one of the masterpieces of satanic wisdom in these latter days."

The Trial of Dr. Briggs Before the General Assembly. A Calm Review of the Case by a Stranger. 12mo, pp. 196. New York: Anson D. F. Randolph & Co. 50 cents.

Upon opening the pages of this "Calm Review of the Case" of Dr. Briggs we find that the "Stranger" writing it is a Presbyterian clergyman who disagrees with the action of the General Assembly at Washington, and finds the view of the prosecuted Professor in entire accord with the doctrines of orthodox Presbyterianism. Heresy apparently appears to the author to be a pretty serious crime, but he does not believe that Dr. Briggs is guilty of departure from the straight and narrow way of the Westminster standard.

The Sistine Madonna: A Christmas Meditation. By Amory H. Bradford. Paper, 12mo, pp. 41. New York: Fords, Howard & Hulbert. 35 cents.

St. Luke: Thoughts for St. Luke's Day. In three chapters, with Hymns and Poems. Selected by a Daughter of the Church. 12mo, pp. 48. New York: Crothers & Korth.

LITERATURE OF THE WORLD'S FAIR.

The World's Parliament of Religions. Edited by the Rev. John Henry Barrows, D.D. Two vols., octavo, pp. 1,600. Chicago: The Parliament Publishing Company.

Neely's History of the Parliament of Religions and Religious Congresses at the World's Columbian Exposition. Professor Walter R. Houghton, Editor-in-Chief. Octavo, pp. 1,001.

Mr. Frank T. Neely, an enterprising Chicago publisher, has prepared a history of the great religious gatherings of the World's Fair for such readers as desire to possess the proceedings in one stoutly bound volume. The account is compiled from original manuscripts and stenographic reports and has been submitted to the editorial charge of Professor Walter R. Houghton. The essential points in all the addresses of the Parliament have been presented and there are also brief summaries of the proceedings of the various denominational and special society congresses. Some twenty pages at the close of the volume are given to brief biographies of some of the chief participants in the Parliament and the expression of opinions from prominent business and literary men upon its value, etc. There are portraits of more than a score and a half of the active workers in the famous Chicago sessions.

The Columbian Congress of the Universalist Church. 12mo, pp. 374. Boston: Universalist Publishing House.

The papers and addresses at the Columbian Congress of the Universalist denomination compose a summary of the history, theological system, polity, practical organization, tendency and purposes of that church, such as one is not likely to meet elsewhere in so convenient and authoritative a form. The volume may be warmly commended both to the members of the Universalist body and to others who are desirous of arriving at a just view of the status of the denomination among its sister churches.

A Chorus of Faith as Heard in the Parliament of Religions Held in Chicago, September 10-27, 1893. With an Introduction by Jenkin Lloyd Jones. Paper, 12mo, pp. 333. Chicago: Unity Publishing Company. 50 cents.

The fact that there are other volumes which give to the public a more extended account of the proceedings of the Parliament of Religions does not lessen the value of the service which Mr. Jones' compilation is qualified to render. He has brought together one hundred and sixty-seven extracts from one hundred and fifteen different authors with the distinct purpose of presenting in cumulative evidence a testimony to the essential unity of the different religious beliefs and aspirations expressed at the Parliament. In his brief introduction Mr. Jones recognizes the fact that discords were not unknown in the Parliamentary session, but they were obviously not the prevailing powers. The day of a Universal Religion, not annulling, but combining the excellencies of the existing religions, is brought nearer. Mr. Jones has arranged the selections of his book under such headings as "Harmony of the Prophets," "Holy Bibles," "Unity in Ethics," "Brotherhood," "The Soul," etc., etc.

The Women's Uprising: A Sermon of the Women's Congress held in Chicago May 15-21, 1893. By Jenkin Lloyd Jones. Paper, 12mo, pp. 25. Chicago: Unity Publishing Company. 10 cents.

This pamphlet is full of that courageous and calm belief in a growing righteousness which characterizes the utterances of Mr. Jones.

Samantha at the World's Fair. By "Josiah Allen's Wife" (Marietta Holley). Octavo, pp. 700. New York: Funk & Wagnalls Co. \$2.50. Sold only by subscription.

A good many people throughout the length and breadth of the land would have been disappointed if "Josiah Allen's Wife" had failed to visit the Columbian Fair, or had been so completely overcome by its immensity as to be unable to record her experiences. Miss Holley, beneath the humor of her style, manages to convey a good many impressions of the Chicago sights and to enforce here and there some significant lessons. The numerous illustrations by Baron C. de Grimm are, of course, a very important factor in the laughter-provoking power of the book.

TRAVEL.

On Sunny Shores. By Clinton Scollard. 12mo, pp. 237. New York: Charles L. Webster & Co. \$1.

A pleasant book of travels is one of the best species of literature to make a winter evening cheerful. Professor Clinton Scollard has rank among the most entertaining of our literary historians of personal rambles abroad. "On Sunny Shores" is a companion volume to the earlier issued "Under Summer Skies," and is illustrated by the same artist, Mrs. Margaret Landers Randolph. The reader is taken to some picturesque corners of England, Germany, Italy, Greece and Syria, and has the benefit of a number of Professor Scollard's poems inspired by the scenes visited.

Gypsying Beyond the Sea: From English Fields to Salerno Shores. By William Bement Lent. Two vols., 12mo, pp. 245-240. New York: Anson D. F. Randolph & Co. \$4

Mr. William Bement Lent, another American tourist, has given us in two volumes a light running account of his sights and impressions in England, Wales, Scotland, Belgium, Germany, Switzerland, Holland, Italy, Russia, Finland, Denmark and Sweden. His graceful and picturesque style seems to indicate a genuine enjoyment of his travels, with especial appetite for scenery and for architectural and other historical attractions. There are a considerable number of full page illustrations.

In the Track of the Sun : Readings from the Diary of a Globe Trotter. By Frederick Diodati Thompson. Quarto, pp. 234. New York : D. Appleton & Co. \$6.

The "Globe Trotter" in the present case has given us—with characteristic American impatience of delay—a brisk and chatty record of a seven months' trip around the world from New York to New York, made some two or three years ago. Mr. Thompson has had an eye for the striking and the curious in the customs of many lands, including some out of the way of usual travel. He dwells particularly upon Japan, China, Siam, Ceylon, India, Egypt and Palestine. The volume is especially attractive in the scores of excellent illustrations by Mr. Harry Fenn and from photographs, and in its general make up it is adapted for presentation and a place on the drawing-room table.

Pictured Palestine. By James Neill, M.A. Octavo, pp. 330. New York : Anson D. F. Randolph & Co. \$2.25.

At one time Mr. Neill was the incumbent of "Christ's Church," Jerusalem, and his acquaintance with life in Palestine is therefore presumably intimate. He writes of the peculiarities of Holy-land agriculture, domestic and ecclesiastical customs and kindred subjects, largely with a view of throwing light upon such points in the Bible as need the explanation of Jewish circumstance. There is frequent reference to the text of the Old and New Testaments. Messrs. James Clark, Henry A. Harper and other artists furnish some four-score illustrations.

The Barbary Coast. By Henry M. Field. Octavo, pp. 268. New York : Charles Scribner's Sons. \$2.

Dr. Henry M. Field, editor of the *New York Evangelist*, has just added to the considerable number of his books of travel an interesting account of a recent, though not a first visit, to Mo-

DR. HENRY M. FIELD.

rocco, Algeria and Tunis. In this interesting region he has had a discriminative eye for things worthy of record in scenery, local customs, race habits, future possibilities of development, etc., etc. In two chapters of historical bearing he writes of Saint Augustine and of the fall of Carthage, and in others there are valuable suggestions concerning a Sahara railway, and the

political outlook in Northern Africa. Dr. Field's style guarantees that the book is a stimulating and easily read volume, and the fifteen illustrations accompanying his chapters are an attractive addition.

In the Land of Cave and Cliff Dwellers. By Lieut. Frederick Schwatka. 12mo, pp. 335. New York : Cassell Publishing Company. \$1.25.

Lieutenant Schwatka has written an easy-running, popular account of some of the incidents and results of expeditions he made to Mexico a few years ago. The most novel feature of his book is found in the descriptions of the dwellings, customs, etc., of the living cliff dwellers the author was so fortunate as to discover in the Sierra Madres of Northern Mexico. There are a number of full-page illustrations.

Rambles in Historic Lands. Travels in Belgium, Germany, Switzerland, Italy, France and England. By Peter J. Hamilton, A.M. 12mo, pp. 315. New York : G. P. Putnam's Sons. \$1.75.

Mr. Hamilton has enjoyed a year's residence in a German University, and more recently a wedding tour of several months in Germany, France, Switzerland, Italy and England. His rather gossip account of the sights which attracted his attention is supplemented by some excursions into the domains of history and art. The ten or twelve illustrations of the book are given to places of interest which are not commonly pictured in volumes of travel.

ESSAYS, CRITICISM AND BELLES-LETTRES.

Darwiniana. Essays by Thomas H. Huxley. 12mo, pp. 475. New York : D. Appleton & Co. \$1.25.

Science and Education. Essays by Thomas H. Huxley. 12mo, pp. 461. New York : D. Appleton & Co. \$1.25.

In Volume II of the now issuing "Collected Essays" of Prof. Huxley are included the extended obituary of Darwin, from the proceedings of the Royal Society, the course of lectures interpretive of the importance and meaning of the "Origin of Species," given to workingmen in 1863, and a number of other chapters related principally to explanation, defense and criticism of Darwin's contributions to the theory of evolution. The seventeen chapters of Volume III include addresses from 1854 to 1887, and compose a treatise on Huxley's view of education and culture, especially in their relation to modern science.

A Short History of the Renaissance in Italy. Taken from the Works of John Addington Symonds by Lieut.-Col. Alfred Pearson. 12mo, pp. 341. New York : Henry Holt & Co. \$1.75.

The original work of the late Mr. J. A. Symonds upon the "Renaissance in Italy" fills seven volumes, and both its length and its price place it beyond the reach of a considerable portion of its natural public. Lieut.-Colonel Pearson, who has condensed the spirit and substance of the large work into one compact volume, has, therefore, rendered many readers a valuable service, as was recognized by Mr. Symonds himself, who cordially approved the purpose of his friend. Mrs. Symonds in her brief prefatory note states that "Col. Pearson's object has been to select and arrange for those who know Italy or hope in the future to do so, whatever may sustain or promote an interest in its history, its art and its literature." The volume contains an excellent portrait of Mr. Symonds.

The Religion of a Literary Man. By Richard Le Gallienne. 16mo, pp. 130. New York : G. P. Putnam's Sons. \$1.

Mr. Le Gallienne's wide-margined pages have a distinct literary flavor, but they offer a serious and rather penetrating discussion of some bothering questions about sin, immortality, Christianity, free-will, etc. It is very pleasant to note that Mr. Le Gallienne, who is just now of considerable prominence as a rising English poet and critic, is very hopeful in regard to the outlook of the religious future. His little book will not appear to the philosophic mind to be a weighty one, but it may be hoped that it represents a reaction against the wide-spread pessimism or indifference in religious matters which are supposed to be chief characteristics of the literary temperament to-day.

Essays about Men, Women and Books. By Augustine Birrell. 16mo, pp. 234. New York : Charles Scribner's Sons. \$1.

That part of the public which likes books with a bookish flavor will welcome a new volume of literary essays by the author of "Obiter Dicta." Mr. Birrell here writes, in his gracefully learned and good humored way, very short sketches

about Swift, Dr. Johnson, Hannah More, John Jay and other people, and about "Books Old and New," "Book-Binding," "The Bona-Fide Traveler" and kindred themes.

Action in Art. By W. H. Beard. 12mo, pp 349. New York: Cassell Publishing Company.

Mr. W. H. Beard's "Action in Art," which is illustrated by more than two hundred reproductions from original drawings by the author, is primarily intended to be of practical service to artists. It may, however, very easily prove interesting to all those concerned with the principles which govern the representation of nature by pencil and brush. Some of Mr. Beard's chapter headings are, "The Action of Living Things," "The Requirements of Art Paramount to Fact," "The Peculiar Characteristic of Animals," "The Elements" and "The Marking of Animals."

Richard Jefferies. A Study. By H. S. Salt. 16mo, pp. 128. New York: Macmillan & Co. 90 cents

Mr. H. S. Salt has for some time been known as a special and careful student of Thoreau and of the poet-naturalist school. He believes in Jefferies as a man and as a writer, and in a little volume which finds place in the "Dilettante Library" gives an interesting, appreciative, though necessarily somewhat slight study of the great English interpreter of nature. The portrait of Jefferies which goes with Mr. Salt's chapters shows the face of a sensitive and rather melancholy nature. Many readers will find useful the short bibliographical appendix.

Essays Selected from The Spirit of the Age, or Contemporary Portraits. By William Hazlitt. 32mo, pp. 337. New York: G. P. Putnam's Sons. \$1.

This new addition to the dainty "Knickerbocker Nuggets" series contains essays by Hazlitt upon William Godwin, Coleridge, Scott, Byron, Southey, Wordsworth, Cobbett, Knowles and other eminent men of the period when "The Spirit of the Age" was first published (1825). Reginald Brinsley Johnson contributes an introductory essay of fourteen pages upon Hazlitt's life and literary quality.

The Lover's Lexicon. By Frederick Greenwood. 12mo, pp. 341. New York: Macmillan & Co. \$1.50.

A very graceful and sympathetic humor pervades the pages of Mr. Greenwood's lexicon, in which from the standpoint of a philosophical, literary observer, and with a pleasant quaintness of style he writes of "Admiration," "Attention," "Doubts," "Gallant," "Prettiness," "Sweetheart" and scores of other terms important in the lover's vocabulary. His playfulness has a basis of sound sense.

The Thoughts of the Emperor Marcus Aurelius Antoninus. Long's Translation. Edited by Edwin Ginn. 16mo, pp 238. Boston: Ginn & Co.

In the very attractive form in which the public can now obtain Mr. Edwin Ginn's arrangement of the "Thoughts" of Marcus Aurelius, it is probable that many older people as well as children will find an acceptable pocket companion.

FICTION.

The Waverley Novels. By Sir Walter Scott. International Limited Edition. With Introductory Essays and Notes by Andrew Lang. Vols. XXII, XXIII. "Kenilworth." Octavo, illustrated. Boston: Estes & Lauriat. \$2.50 each volume.

In his editorial introduction to the two volumes of the "International Limited Edition" of Scott devoted to "Kenilworth" Mr. Lang writes of the great novelist's disregard of historical facts whenever they did not serve his purpose as romancer. The fourteen illustrations of these two volumes include two which show us Queen Elizabeth and a large number in which the beautiful Amy Robsart appears.

Humbled Pride. A Story of the Mexican War. By John R. Musick. 12mo, pp. 462. New York: Funk & Wagnalls Company. \$1.50.

The penultimate volume of the "Columbian Historical Novels," is, on its historical side, a relation of the events of the Mexican War, though, as in the previous stories, Mr. Musick has touched upon very many affairs of our history more or less closely connected with his principal theme. The illustrations are spirited and the intermingling of romance and history seems as successful as in the early volumes of the series.

Memoirs of Two Young Married Women. By Honoré de Balzac. 12mo, pp. 332. Boston: Roberts Brothers. \$1.50.

"The Memoirs of Two Young Married Women," which Balzac wrote in 1841 and dedicated to George Sand, belongs to the "Scenes from Private Life." In this novel, written in the at present rather unusual epistolary form, Balzac shows his great insight into woman nature, and draws with great subtlety and clearness a contrast between a most happy marriage *de convenance* and the unhappy wedded life of a passionate and more or less selfish woman.

An American Peeress. By H. C. Chatfield-Taylor. 12mo, pp. 293. Chicago: A. C. McClurg & Co. \$1.

The "American Peeress," whom Mr. Chatfield-Taylor's fancy has created, unwittingly marries an English nobleman whom she has met in her suburban home near Chicago, is taken to England, and after an unpleasant experience with the shallowness of English conventional society life, returns with her husband to lead a happy existence on the shores of Lake Michigan.

The New Minister. By Kenneth Paul. 12mo, pp. 342. New York: A. S. Barnes & Co.

"The New Minister" is decidedly a love story, but it gives an interesting and carefully drawn picture of modern church affairs in a New Jersey manufacturing town, and introduces, not without force, some of the theological tumult which a young preacher nowadays is supposed to meet.

Elsie: A Christmas Story. From the Norwegian of Alexander L. Kjelland. By Miles Menander Dawson. 12mo, pp. 109. Chicago: Charles H. Kerr & Co. 50 cents.

"Elsie" is a powerfully realistic and a very sad story, translated by Miles Menander Dawson from the Norwegian of Kjelland. It is perhaps the masterpiece of this Scandinavian fictionist, of whom Professor Boyesen declares: "No man had ever written the Norwegian language as this man wrote it." The simplicity of the story may recall "A Happy Boy," but there is far more dramatic interest and the complexion of the tale is entirely different.

Garrick's Pupil. By Augustin Filon. Translated from the French. 16mo, pp. 217. Chicago: A. C. McClurg & Co. \$1.60.

"Garrick's Pupil" is a story of the days of the Gordon riots, and Sir Joshua Reynolds, Samuel Johnson and other prominent Englishmen of the time play a part in the tale. The translator has succeeded in preserving for us the tone of London life in 1780, which the original writer, considering that he was a Frenchman, seems to have understood surprisingly well.

The Quickening of Caliban. A Modern Story of Evolution. By J. Compton Rickett. 12mo, pp. 258. New York: Cassell Publishing Company. \$1.

The "Caliban" of Mr. Rickett's story is a strange creature from the wilds of Africa, half animal, half man, in its early actions, and lifted to a higher stage by love for the heroine of the tale, who also has a trace of African blood in her veins. The scenes of the story are laid in the dark continent and in London. The recital is a clear and interesting one, and the plot offers not a little opportunity for serious reflection on the part of the reader and for dramatic situations on the part of the author.

The Emigrant Ship. By W. Clark Russell. 12mo, pp. 348. New York: Cassell Publishing Company.

Mr. W. Clark Russell's last novel belongs to the type in which our interest lies principally in the stirring and frequent adventures. The emigrant ship, during the time in which it concerns the reader, is in the hands of a crew composed of young women on their way to Australia.

The Redemption of the Brahman. A Novel. By Richard Garbe. 12mo, pp. 82. Chicago: The Open Court Publishing Co. 75 cents.

"The Redemption of the Brahman" tells of the escape of a young Hindoo from the bonds of caste, under the influence of contact with the English. The time of the story is about the middle of our century, and the scenes are laid in India.

Prince Ricardo of Pantoufia. By Andrew Lang. 12mo, pp. 204. New York: Longmans, Green & Co. \$1.25.

In this charming fairy tale, which is appropriately illustrated by Gordon Browne, Mr. Lang continues, with an interweaving of not burdensome historical reference, the story of the house of Prince Prigio.

POETRY AND THE DRAMA.

Allegretto. By Gertrude Hall. Octavo, pp. 111. Boston: Roberts Brothers. \$1.50.

"*Allegretto*" is the appropriate title of a volume of short poems by Gertrude Hall, with fitting and very numerous illustrations by Oliver Herford. The verses are for the most part exceedingly light, in the prevailing French spirit, though there is not a rondeau or a triolet in the volume. A few translations are included. The words and the pictures will please those who like dainty bits of verse and illustrations, without much depth, but not lacking in grace or in a certain human quality. The book is dedicated to the lamented young Wolcott Balestier.

Songs of a Day and Songs of the Soil. By Frank L. Stanton. 12mo, pp. 114. Atlanta, Ga.: Foote & Davies Co.

The public has demanded a second edition of the remarkably simple and remarkably musical lyrics of Mr. Frank L. Stanton, of Atlanta. Mr. Stanton's songs of love and of religious trust are of the old popular stamp, resembling many poems of Whittier. The "*Songs of the Soil*" included in the volume are written in dialect, and are true to their name. A portrait of the author is prefixed to the poems.

Adirondack Readings. By Edward Sherwood Creamer. Author's Edition. 12mo, pp. 121. Buffalo: Charles Wells Moulton.

Mr. Creamer's selection of his poems includes a considerable number of sonnets on various subjects and a goodly supply of verses relating to the civil war, etc., etc. In some of the more reflective bits there is a good deal of thought and occasionally a noticeably original way of presenting it.

Father Junipero Serra. A New and Original Historical Drama in Four Acts. By Chester Gore Miller. 12mo, pp. 161. Chicago: Published by the Author.

Mr. Miller's recent production is a four-act drama written mainly in blank verse, and aiming to be a "historical-pastoral" presentation of the life of one of the pioneers in the early Catholic missionary work in California. The scenes are laid in that State as it existed somewhat more than a century ago. The author has spent many of his years in California.

Songs and Ballads. By Herman Rave. 16mo, pp. 121. Indianapolis: The Bowen-Merrill Co.

There are some very commendable passages and poems in Mr. Rave's little collection. Though there is perhaps nothing which could fairly be called strikingly poetic in the execution, there is evidence of fancy.

EDUCATION AND TEXT-BOOKS.

Object Lessons and How to Give Them. By George Ricks, B.Sc. First Series for Primary Schools. Second Series for Intermediate and Grammar Schools. Boston: D. C. Heath & Co. Each 90 cents.

Belonging to Heath's "How to Teach" series are two little volumes by George Ricks, an English educator, intended to give definite and logical instruction in the best modern methods of object teaching. His first series is for primary schools, and, beginning with the lessons devoted to the simplest perceptions of color and form, it ends with an observation of the various qualities of metals. The second series, for intermediate and grammar schools, partakes somewhat of the nature of an elementary treatise on experimental physics. The experiments suggested and described are numerous and are such as to demand only easily obtained apparatus. Both volumes are well illustrated.

College Preparatory French Grammar. By Charles P. Du Croquet. 12mo, pp. 284. New York: William R. Jenkins. \$1.25.

M. Du Croquet has prepared a French grammar for students who wish accurate and rapid preparation for college examinations in that language. The rules and exercises—the French exercises are devoted to anecdotes about and selections

from eminent French writers—make forty lessons and the ground may be covered in about one year. M. Du Croquet has kept in mind the pupil's need of learning to read at sight.

Paul Bercy's French Reader for Advanced Classes. By Paul Bercy, B.L., L.D. 12mo, pp. 333. New York: William R. Jenkins. \$1.25.

Dr. Paul Bercy, director of a well-known school of languages in New York, sends out a French reader which contains choice short selections from Bourget, Daudet, Halévy, Maupassant and other eminent French writers of this century, to the number of thirty. The author has added about fifty pages of explanatory notes. The selections themselves are excellent, and such as have not before found their place in ordinary French readers.

Gustav Adolfs Page. By Conrad Ferdinand Meyer. Edited by Otto Heller. Heath's Modern Language Series. Paper, 12mo, pp. 85. Boston: D. C. Heath & Co. 30 cents.

A late issue in Heath's "Modern Language Series" contains, with some omissions, the text of Meyer's "*Gustav Adolfs Page*," with introduction and notes by Prof. Otto Heller, of Washington University.

Complete Graded Arithmetic. By George E. Atwood. Part I, 12mo, pp. 200, 45 cents. Part II., 12mo, pp. 382, 85 cents. Boston: D. C. Heath & Co.

In this new arithmetic, Mr. Atwood places definitions, principles and rules at the end of each volume and the body of the text consists almost entirely of carefully chosen problems. The author's aim has been to prepare a practical text-book, which shall leave as little outside work as possible for the teacher. Part first covers the ground of the fourth and fifth grades; part second the work of the sixth, seventh and eighth grades. Mr. Atwood believes in the principle of frequent and well directed reviews.

Child's Hand-Book for Collecting Stories and Pictures of Animals. By a Lover of Children. Quarto. New York: William Beverly Harrison. \$1.

The "Lover of Children" who has prepared this useful volume has, as it were, arranged a frame work and left it to the little folks to complete the building. Most of the pages are simply blank paper, upon which, in accordance with the printed and pictorial directions given in the book, are to be pasted stories and pictures of animals in the regular scientific order of classification. Part I is prepared expressly for collections about mammals.

TECHNOLOGY AND BUSINESS.

The Inventions, Researches and Writings of Nikola Tesla. By Thomas Commerford Martin. Octavo, pp. 507. New York: The Electrical Engineer. \$4.

Mr. Nikola Tesla is at present one of the most distinguished investigators in the field of electrical science. The editor of *The Electrical Engineer* has prepared a volume which enters fully into the most important researches of Mr. Tesla, and which is based to a considerable extent upon the lectures and writings of the brilliant young Servian. The book contains a portrait of Mr. Tesla and numerous illustrations explanatory of his experiments and their results.

The American Printer. A Manual of Typography. By Thomas MacKellar, Ph.D. 12mo, pp. 393. Philadelphia: MacKellar, Smiths & Jordan.

The public is now supplied with the eighteenth edition of "*The American Printer*," a standard work entering into a detailed account of all the instruments and processes of the printer's art and the terms peculiar to the craft, with much correlated matter. Not only foremen and apprentices, but those interested in the editorial or publishing sides of the "art preservative of arts" may find the volume serviceable. It is fully illustrated and indexed.

Practical Business Bookkeeping by Doubly Entry. By Manson Seavy, A.M. Quarto, pp. 246. Boston: D. C. Heath & Co. \$1.55.

Mr. Manson Seavy, who is at present instructor in bookkeeping in the English high school of Boston, sends out a neat-appearing text-book in his specialty, which he has arranged to meet the wants not only of students in school, but of business men and others desiring a succinct and complete treatise on bookkeeping.

THE REVIEW OF REVIEWS.

VOL. IX.

NEW YORK, MARCH, 1894.

NO. 3.

THE PROGRESS OF THE WORLD.

*Brazil's
Unfought
Naval Battle.*

The great sea fight in Brizilian waters to which naval men were looking forward with so keen an interest when the *El Cid*, under its new Brazilian name *Nietheroy*, steamed out of New York harbor, has not yet taken place, and is not very likely ever to eventuate. Neither side in the Brazilian struggle has seemed to be willing to risk a meeting between the opposing fleets. The ships fitted out under President Peixoto's order at New York have not proved quite satisfactory to the Brizilian authorities, according to reports. The Ericsson torpedo boat, the *Destroyer*, which was purchased conditionally, has been rejected as a failure, and now lies in South American waters subject to the orders of the disappointed owners in the United States, who must leave her to inglorious decay where she is, or else pay a heavy price to have her towed back to New York. The remarkable energy and resources displayed by Peixoto in the quick improvising of a navy through his agents in Europe and the United States, has thus far had no other effect upon the pending conflict than a moral one. It strengthened the impression abroad, if not in Brazil, that the existing authorities at Rio were comparatively strong, and it helped to prevent the recognition of the insurgents as possessed of belligerent rights.

*Status of
the
Insurgents.*

The balance, indeed, has hung so nearly even that the granting to Admirals Mello and Da Gama by the United States and the European powers of the much-desired recognition might have been sufficient to change the situation very materially. Thus if Da Gama had possessed the same standing as a belligerent under the usages of international law that the Confederate States held during our civil war by virtue of the prompt recognition they obtained from England and France, it would not have been permissible for Admiral Benham to have pursued the course which last month lifted him into sudden fame. Our government at Washington objected most strenuously to the recognition of the South by Europe; yet it must be plain that there was far greater reason for according belligerent rights to the Confederacy than now to the Brazilian insurgents. The Confederacy was a completely organized government, and its constituent states were well-established commonwealths of long standing. It possessed a fixed seat of government and an extended and definite territory with a large population.

It was no mere provisional committee or junta that exercised authority at Richmond, but a fully empowered government, established by the sanction of the people and the State governments. To be sure its right to exist was denied by the government at Wash-

PRESIDENT FLORIANO PEIXOTO.

ington; and a great war was raging, the outcome of which would show whether Europe had acted wisely or prematurely in according recognition. Nevertheless, the diplomatic historian and international jurist of the future will readily admit that the Southern Confederacy had a very colorable claim to European recognition, and that such recognition was not incompatible with a conscientious view of the duties of neutrality. The case in Brazil has all along been a totally different one. The rebellion has been too nomadic to give it any character of international responsibility. It has had no organized government to represent it, and has held no definite territory in which it has exercised authority. It would seem that the insurgents originally expected to gain full control over the great south Brazilian State of Rio Grande do

Sul, and there to locate and organize a rival government, which, with the help of the revolted navy, might confidently expect in a short time to gain the upper hand and assume control of Brazil in its entirety. But the struggle in Rio Grande do Sul has not resulted in any such thing as a conclusive mastery on the part of the elements which are represented before the world by the admirals of the rebel navy. In asking, therefore, as they have repeatedly done, for the concession of belligerent rights, Admirals Mello and Da Gama have never been able to show that they definitely represent anybody besides the forces under their naval and military command, nor that they have had any definite resources beyond their armed ships and the supplies of ammunition they have been fortunate enough to secure from time to time.

*Admiral
Benham's
Performance.*

The accordance of belligerent rights would, of course, have given the insurgents many opportunities and privileges in foreign ports which they do not now possess, and above all would have insured them the unhampered opportunity to blockade and besiege Rio, which has been their chief desire. It is somewhat surprising that the insurgents should have been allowed to behave as they have done these many months in the great port of the Brazilian capital. Without having

ADMIRAL BENHAM, U. S. N.

chants of many countries. They had insisted upon keeping up a spasmodic but very frequent cannonading of the Brazilian forts and harbor defenses, and had thus made it impossible for the merchant ships of other nations to go to their docks and discharge and receive cargoes. At length, Admiral Benham, in command of a formidable squadron of our new white war ships, informed Admiral Da Gama, of the insurgent navy, that interference with the peaceful trade operations of our American merchant vessels would no longer be tolerated, and that two or three small sailing ships under the Stars and Stripes then lying at anchor waiting for an opportunity to go to the docks would at once be escorted to their places by United States war vessels. Da Gama made some show of protest, and decks on both sides were cleared as if for action; but the insurgents had not the temerity to attack a superior force, and the American ships were duly escorted to their wharves. Our government at Washington was most fully justified in giving Admiral Benham the instructions which he carried out so intelligently and with so much spirit. Far from acting hastily, our government had shown a very great tolerance and leniency in not taking this same step a number of weeks sooner. But the simple fact is that the whole Brazilian complication has been a very difficult one to fathom, and it has seemed wise to foreign nations to keep as clear as possible from what might seem interference on either side, in the hope that the Brazilians themselves

ADMIRAL DA GAMA.

would soon compose their differences for their own benefit and also for the benefit of the commercial world at large. During some days previous to Admiral Benham's decisive action in Rio harbor, it had been constantly rumored that he was acting as a mediator between the warring elements; but this report was evidently a mistake. That his presence with a strong naval display from this country has been a highly salutary influence in South America no one anywhere, even in Europe, is disposed to deny. Our American merchant marine is so small an affair, comparatively speaking, that its annoyances at Rio have been insignificant when compared with the obstruction and delay which have been occasioned to hundreds of European vessels. When Admiral Benham was tendering his gallant services to three small ships floating the Stars and Stripes, the harbor was lined with great and small British, German, Norwegian and other foreign vessels, which had been waiting indefinitely for a chance to transact the business that had brought them to South America. Why had not England, long before, taken the same steps Admiral Benham took, in assertion of the right of foreign vessels to trade unrestrictedly with Brazil? In some quarters it is asserted that the sympathy of England with the insurgents is the true explanation. However that may be, the course pursued by the United States could but result in freeing the port of Rio for the merchant ships of other countries as well as for our own. The Brazilian presidential election day is March 1, and it is to be hoped that Peixoto's successor may know how to conciliate the insurgents and end the war without any more fighting. On February 9, the insurgents made a desperate land assault on the Nictheroy fortifications, near Rio. They encountered a greatly superior force, and were finally repulsed; but not until they had inflicted terrible loss upon Peixoto's troops. Admiral Da Gama led the attack. He is reported as shooting an opposing colonel and mounted the dead man's horse,—an example followed by a number of his sea-faring followers. He was wounded in the fray. A desperate bombardment was anticipated at he last reports received before we closed our month's record.

The Wreck
of the
"Kearsarge"

Although our newspapers have been disappointed in the expectation that they would have an opportunity to report for their readers a great sea fight between the *Nictheroy* and the *Aquidaban*, they have nevertheless found a very suitable occasion for recording at length the story of another spirited and momentous duel at sea. The most famous of the few wooden ships of our old navy which had still been kept in repair and in active service was the *Kearsarge*. On February 2 she struck upon Roncador, a dangerous coral reef in the Caribbean sea, some two hundred miles from the Central American coast, was firmly lodged there, and had to be abandoned to her fate. On June 19, 1864, the *Kearsarge* gave battle to the swift and terrible Confederate cruiser *Alabama* and sunk her. The *Alabama* had been fitted out in England to prey upon the commerce of the United States. Just before the war this country was possessed of the largest merchant marine in the world, and the American flag was literally seen on every sea and in every port. The *Alabama* above all was instrumental in destroying our commercial shipping. She sailed from Liverpool on her destructive mission on July 29, 1862. She pursued her career for two years, in spite of the most assiduous efforts on the part of the United States navy to overtake and capture her. In the month of June, 1864, she was lying in Cherbourg harbor on the French coast. The *Kearsarge*, under the command of Captain John A. Winslow, had been especially commissioned to seek an engagement with the *Alabama* and if possible to destroy her. At length, having completed his overhauling and all desired preparations, Captain Semmes of the *Alabama* sailed forth with the express object of trying issues with the *Kearsarge*. The *Alabama* advanced directly toward her opponent, fired the first shot and opened the combat. But she proved no match for the *Kearsarge*, whose more deliberate and accurate gunnery, and whose terrific broadsides, did their work in a very short time. The *Alabama* went to the bottom in deep water within a very short time after she had struck her colors. She had in her career, as a commerce de-

stroyer, produced direct devastation to the extent of more than fifteen millions of dollars, but this sum represented only a fraction of her fearful achievement, for the terror of her name had forever frightened dozens of American ships from the highways of commerce for every vessel that she had actually met and destroyed. It is not strange, then, that the *Kearsarge* should have been treasured as an historic ship, and

UNITED STATES SLOOP OF WAR "KEARSARGE."

the newspapers were amply justified when she struck the reef last month in retelling the story of her combat with the *Alabama* some thirty years ago. She is one of the ships which would doubtless have been preserved by act of Congress as a historic relic. She had practically outlived her usefulness as an active member of the navy, and had no great commercial value, so that her loss does not much detract from the efficiency of the navy. It is not, for instance, any such loss as that of the great British ironclad *Victoria*; and best of all, her accident was not attended by any immediate loss of life. It was upon this same Roncador reef that ex-Senator Warner Miller and his party were wrecked some two years ago on their way to Nicaragua to inspect the beginnings of work on the canal. The latest advices point to the possibility of floating the mutilated *Kearsarge* off the reef and saving her. As a matter of sentiment, the attempt is worth making.

Robert Stein's
Arctic
Expedition.

The long and ghastly list of disasters which the history of Arctic exploration records has naturally enough led to the common opinion that all polar research is foolhardy adventure, and that new propositions to invade some

impression must also be revised that the arctic regions contain little that is worthy either of scientific research or of economic development or acquisition. Until very recently there seemed to be but two avowed objects of arctic travel. One was to discover a practicable northwestern passage from the Atlantic to the Pacific, and the other was to discover the north pole. The northwest passage was at length found, and its impracticability for commercial uses has been conceded on all hands. The mere attempt to attain a higher latitude than any previous explorer has been able to reach has deservedly lost sympathy in every influential quarter, and is not likely to be made either the avowed or the indirect object of any expedition in the early future. Nansen, in his bold journeyings, has certain definite geographical and scientific questions to solve; and few future expeditions will be deemed worthy of notice unless they shall rest upon a thoroughly approved scientific basis and shall proceed upon safe and comparatively unromantic lines. It is now expected that a new American expedition under the leadership of Mr. Robert Stein, of the United States Geological Survey, will set sail for the arctic regions in the coming month of May. Mr. Stein has laid out for himself a perfectly definite task. He pronounces it an easy and safe one. Most explorers prefer to surround their projects with an air of mystery, and to allow the public to think that they are undertaking things boldly adventurous and full of a kind of hazard that should make the average citizen shudder and that could only be faced by men of the most dauntless and heroic type of courage. Mr. Stein, however, throws no glamour over his proposed undertaking and leaves no part of his plan unrevealed.

To Study
Ellesmere Land.

In a singularly lucid and interesting way he explains that the efforts to penetrate high latitudes toward the north pole on the one hand, and the search for the northwest passage on the other hand, have resulted in leaving a very large region almost totally unexplored,—this region consisting of Ellesmere Land, Grinnell Land, and in general the islands and coasts lying northwest of Baffin Bay and west of Smith Sound, and of the channels leading northward into the so-called Lincoln Sea. The eastern coast of Ellesmere Land and of Grinnell Land has been sufficiently studied, but the western and northern coasts are not known at all. Ellesmere land, although so readily accessible and so near the ordinary track of whaling steamers, is practically *terra incognita*. There are from three hundred to five hundred miles of shore line yet to be traced and added to our gradually increasing knowledge of arctic geography. It has long been claimed that there is a tribe of Esquimaux in western Ellesmere Land never yet visited by white men. It will be one of Mr. Stein's tasks to investigate this question. A number of interesting and wholly meritorious objects as to observations of animal and plant life, mineral deposits, geodetic conditions, and meteorological data are included in Mr. Stein's plans.

MR. ROBERT STEIN.

portion of that forbidden field are not entitled to sympathy or encouragement. This popular impression must, however, be revised in the light of new methods, new objects and new knowledge. The

ALFRED BJÖRLING.

EVALD KALLSTENIUS.

THE YOUNG SWEDISH NATURALISTS LOST IN THE ARCTIC REGIONS.

To Rescue
Björling's
Party.

Not the least commendable of his objects will be an attempt to rescue two young Swedish naturalists, Björling and Kallstenius.

These two adventurous young men set out from St. Johns in June, 1892, with a small schooner and a crew of three men, to make a trip of scientific observation and collection along the west Greenland coast. Captain McKay, of a Scotch whaling ship, in June of last year discovered the wreck of the schooner and the body of one of the crew on the Cary Islands. Letters addressed to Sweden were found which explained that the wreck had occurred in August, 1892, and that the party in October of that year were starting immediately for Ellesmere Land, with provisions enough to last until the beginning of 1893, and with the hope of reaching the Esquimaux settlements. They expected to return to the Cary Islands in July of last year, in the hope of being picked up by a whaling steamer or of pressing on to the Danish settlements on the Greenland coast. Nothing has since been heard of these young men. They had guns and ammunition, and inasmuch as Ellesmere Land and adjacent waters are supposed to teem with animal life it is hoped that they have been able to sustain themselves and that Mr. Stein

may find them alive and well. The rescue of these young Swedes would be a most happy achievement for Mr. Stein's party.

MR. STEIN'S PROPOSED ROUTE.

Mr. Stein's
Plan of
Operations.

The general plan of operations proposed by Mr. Stein is worthy of close attention. He holds that henceforth all spasmodic and occasional attempts at arctic exploration ought to give way to permanent and continuous scientific work conducted from the standpoint of a permanent base of supplies. He proposes to begin by building a house and depositing two year's provisions at the southeast end of Ellesmere Land, where Jones' Sound opens westward from the upper end of Baffin Bay. Waiving the question of obstruction by ice floes, this permanent depot will be within easy reach of the established track of the whaling steamers, which find their hunting grounds in Lancaster Sound. The accompanying map will make this point clear. Those not familiar with the perils encountered by ships engaged in the whaling trade will not have considered how frequent are the wrecks upon those bleak coasts and how important for this great branch of commerce would be the existence in that region of a house of refuge and a center of relief and rescue. Its maintenance would not be expensive, and the whalers themselves could easily afford to pay the bills. But apart from its value to the whaling trade, this permanent depot, according to Mr. Stein's ideas, could be made the main base of supplies for a series of stations thrown out along different radials into the regions which remain to be thoroughly explored. These stations could be so connected with one another and with the main depot as to minimize the risks and maximize the results of exploration and scientific inquiry. Moreover, the plan laid down by Mr. Stein, far from being impracticable on account of expense, would prove a much cheaper method of acquiring a knowledge of the arctic regions than that of any occasional independent expeditions, each beginning *de novo* with an original equipment. In short, Mr. Stein has laid down a most admirable plan, and it is to be hoped that nothing may interfere with its realization.

Captain Wiggins'
Siberian Voyage.

While the scientific explorers and investigators are adding to our knowledge of the regions beyond the arctic circle, the practical navigators and pioneers of trade and commerce, who in the past have done most to give the world acquaintance with itself and to make known its mysterious regions and its unsuspected resources, have in one quarter and another been continuing the work which they have been doing almost without cessation for more than four hundred years. One of the most notable of their recent exploits has been the final success of Captain Wiggins, a sturdy and experienced English navigator, in proving the commercial feasibility of the water route from the European and British ports around the coast of Norway, past the North Cape, through the strait that separates Nova Zembla from the main land, into the Kara Sea and the Arctic Ocean, and thence into Siberia's great navigable river, the Yenisei. Captain Wiggins some weeks ago successfully conducted a fleet of vessels through this

route and up the river a distance of perhaps fifteen hundred miles to the big Siberian town of Yeniseisk, which is to be one of the main division stations on the route of the great trans-Siberian railway now under construction. The task of building the road will be enormously facilitated by the use of this water route for the bringing to the interior of railway iron and supplies, Captain Wiggins' ships having brought the first supply of rails. Great celebrations and festivities lasting through a number of days were made the order of exercises at Yeniseisk. We have been wont to consider Siberia a desolate waste, but within a decade or two it will be recognized as a region of great resources and possibilities, both agricultural and mineral.

MR. JOSEPH B. TYRRELL,
The Canadian Explorer.

Exploration
Beyond
Hudson Bay.

There is a very considerable field yet to be explored in the heart of our own continent. This fact is strikingly illustrated by the recent noteworthy expedition of Mr. Joseph B. Tyrrell, accompanied by his brother, Mr. J. W. Tyrrell, and several Canadian Indians. Mr. J. B. Tyrrell is a highly distinguished young Canadian surveyor and geologist who has been engaged in various explorations in the far Northwest territories of Can-

ROUTE OF THE TYRRELLS TO CHESTERFIELD AND RETURN.

ada, and who has, indeed, spent most of the past eleven years in scientific and geographical work in the vast region lying northwest of Winnipeg. The district known by the name of the Barren Lands, lying between the Athabasca river and the Great Slave Lake and Hudson Bay on the east, has never until now been traversed, so far as is known, by any human foot. The Canadian authorities at Ottawa desired to learn what there might be in the way of fur-bearing animals or mineral riches in this region, comprising some 200,000 square miles. To Mr. Tyrrell was accordingly assigned the task of crossing that country and reporting upon its character and resources. His expedition started from Edmonton, in Alberta, last May, proceeding down the Athabasca river by canoes, through Lake Athabasca, up the Black river; and thence, partly following streams and lakes and partly traveling on foot, the party pressed on to Chesterfield Inlet, on the west side of Hudson Bay, reaching that point about September 1. They were certainly the first white men who had ever crossed this great stretch of many hundreds of miles from the Athabasca basin to Hudson Bay. The return was along the shore of Hudson Bay to Fort Churchill, resulting in a great change of previous ideas as to the conformation of that large body of water. From Fort Churchill the route was southward to Winnipeg. The total trip, two-thirds of which was by canoe, covered a distance of 3,200 miles. Lieutenant Tyrrell reports that the barren lands are valueless, so

far as fur-bearing animals are concerned, and that their mineral value remains yet in doubt. The expedition was a highly important one, and its successful conduct reflects great credit upon the Messrs. Tyrrell.

Progress with the Tariff Bill.

The firmness and mastery with which, under circumstances threatening serious party disagreements, the administration at Washington and its supporters in the two houses of Congress have been able to compel the adoption of their main lines of policy testifies above all else to the iron will and inflexible political grasp of President Cleveland. The Wilson tariff bill was certainly distasteful to a large number of Democratic Representatives, and the income tax feature of the internal revenue bill was odious to a still greater number. Yet these two halves of the proposed new revenue arrangements were welded together into one grand bill for providing a complete revision of the system of national taxation, and the Democratic House at the time appointed for the final vote gave its sanction to the entire work of the Ways and Means Committee. It was with difficulty that a Democratic quorum could be obtained, but party discipline availed to carry the measure. As this number of the REVIEW goes to press the Senate is still at work upon its own version of a Democratic revenue system; but there is no great reason to doubt the eventual acceptance by the Senate of the main outlines of the measure sent to it from the House. It is quite possible that the bill in its final form may restore a light duty upon coal and sugar, but otherwise the Wilson bill, income tax and all, may be expected to pass and to receive the sanction of the President. It is the earnest desire of the thoughtful leaders of the party in power that the business of the country should be relieved of suspense by the settlement of the tariff question at the earliest possible moment.

Hawaii Again.

In the House the resolution reported from the Committee on Foreign Affairs by Chairman McCreary, dealing with some aspects of the Hawaiian question, was adopted by a strict party vote, many Democrats being absent, and a very few voting with the Republicans. The resolution assumes the finality and accuracy of Mr. Blount's report, censures the conduct of Minister Stevens, and commends the principle of non-interference in the domestic affairs of the Hawaiian Islands. It refers in no way whatsoever to Mr. Cleveland's attempt to restore the monarchy, or to the grave acts of interference committed by Minister Willis under direction of his superiors at Washington. It intimates to foreign powers that they are expected to keep out of the Hawaiian imbroglio. President Dole's exhaustive reply to Minister Willis' demand for specifications as to the latter's unfriendly attitude toward the Hawaiian government appeared in the American newspapers of February 16, and is a document which, it is fair to say, a majority of thoughtful Americans will have read with a strong sense of humiliation.

Meanwhile, however, the frightful strain of apprehension at Honolulu is relieved. There is no longer any danger that the United States government will interfere to overthrow the provisional government. The Hawaiian question is far from closed, but it may very well be allowed to fall into quiescence for the present. The next Congress or the next administration may view Hawaiian affairs in a wholly different light from that through which Mr. Cleveland and Mr. Gresham have been able to see them.

*Silver and
the
Seigniorage.*

It was hoped by the country in general, when the long silver struggle in the autumnal session resulted in the repeal of the Sherman law, that the agitation of the free silver coinage men would be allowed to rest in abeyance for

HON. RICHARD P. BLAND,

Chairman of the House Committee on Coinage.

at least a year or two. Even many of the strongest friends of bimetallism believed that the movement for the restoration of silver as a money metal would be best promoted by a policy of waiting. But this view was not entertained by Mr. Bland and the majority of his House Committee on Money and Coinage. Accordingly, when the Wilson tariff bill with its income tax appendage was passed and sent to the Senate, and when the McCreary resolution sustaining the President's Hawaiian policy was accepted after several days of stormy debate, Mr. Bland was ready to force the discussion of his proposal to inflate the currency

by turning the Sherman treasury notes into silver certificates, and by issuing an additional \$55,000,000 of such silver-certificate currency through the process commonly known as "coining the seigniorage." If there should happen to be a reader of the REVIEW OF REVIEWS who does not understand exactly what is meant by Mr. Bland's proposal to put \$55,000,000 into the treasury by "coining the seigniorage," he need not feel especially discouraged. There are members of Congress who would find it hard to explain clearly. The word seigniorage has usually been applied to the mere fraction of one per cent. charged at the mint to cover the expense of converting bullion into coin. A broader definition, however, and one that is sanctioned by the "Century Dictionary," is as follows: "The difference between the cost of a mass of bullion and the face value of the pieces coined from it." Now the Sherman act called for the purchase by the government of 4,500,000 ounces of silver bullion each month at the current or market price for silver bullion. The government paid for the bullion in special treasury notes. Inasmuch as the price of silver was constantly fluctuating, the volume of these notes issued from month to month was never the same, although such monthly issues were always based upon practically the same quantity of bullion. Altogether, from the time of the passage of the Sherman act in July, 1890, up to its repeal on November 1, 1893, somewhat less than \$154,000,000 was issued in treasury notes in payment for a great mass of silver that now lies in the government vaults. Our standard silver dollar contains 371.25 grains of pure silver. The mass of bullion bought with the \$154,000,000 of treasury notes is great enough to make about 209,000,000 standard dollars if it were actually coined. Thus, in 1890 the bullion value of the silver dollar fluctuated between 93 and 74 cents, but averaged 81 cents for the year. In 1891 it averaged about 76 cents. In 1892 it averaged a little over 67 cents, and in 1893 the average was not far from 60 cents. Thus far in 1894 the price has been considerably lower still, and at the market price for silver bullion in February, the \$154,000,000 of treasury notes would have bought bullion enough to coin very nearly 300,000,000 standard dollars. The simple fact, then, is that \$154,000,000, approximately, of these treasury notes are outstanding, and that the mass of silver behind them is great enough to coin not only 154,000,000 silver dollars, but also some 55,000,000 additional. The Sherman act made these notes redeemable in gold or silver coin, and gave the Secretary of the Treasury authority at his discretion to coin the silver. But it will require a number of years, working all the mints at full capacity, to manufacture the 209,000,000 silver dollars for which there is no demand. Mr. Bland's idea is to expand the circulating paper currency represented by this mass of silver from the outstanding issue of treasury notes to an amount \$55,000,000 greater, by treating the whole of it as if it were a deposit of coined silver dollars, for each of which a corresponding paper dollar should be sent out. If this measure should become a law, its effect would be to

put \$55,000,000 into the treasury of the government to help the Secretary out of the difficulties occasioned by the serious deficiencies in the current revenue. But, inasmuch as the continued depreciation of silver has made the mass brought under the Sherman act worth in the market to-day considerably less even than the \$154,000,000 of treasury notes, it is plain that the issue of additional notes as against the seigniorage so-called would be no better than an out-and-out issue of fiat money. In fact, as between this proposition and that of the Greenbackers, who have always consistently demanded the unambiguous issue of treasury notes secured by nothing but the credit of the nation, the latter method would seem preferable. Moreover, the proposition helps the silver mining industry in no manner, directly or indirectly. It is a make-shift that has little to commend it and that is objectionable upon many grounds.

Mr. Peckham's Defeat. The struggle in the United States Senate over the question of confirming Mr. Cleveland's successive appointments to fill the vacancy on the Supreme bench has caused far more political excitement in Washington during

MR. WHEELER H. PECKHAM.

January and February than the tariff discussion, the proposed income tax, the Hawaiian question, and Mr. Bland's bill for "coining the seigniorage," all put together. The defeat of Mr. Hornblower by a slight majority of the Senators was quickly followed by Mr. Cleveland's submission of the name of Mr. Wheeler H. Peckham of the New York City bar. Mr. Peckham is an independent Democrat in politics, and has been chiefly known outside of the ranks of his profession as an active and strenuous opponent of Mr. David B. Hill's machine politics, of Tammany methods in general, and particularly of the attempt to make Isaac H. Maynard a judge of the Supreme Court of the State of New York. Mr. Peckham's nomination was naturally more distasteful to Senators Hill and

Murphy, of New York State, than Mr. Hornblower's had been. It would seem that the Senate had somewhat informally arrived at an understanding that it would prefer not to confirm men for the United States bench who had passed the age of 60, and Mr. Peckham has lived somewhat beyond that limit. Republican Senators, moreover, made the point against Mr. Peckham that he was clearly on record as having declared his belief that a protective tariff is absolutely unconstitutional; and this of course, if true, amounts to a very respectable reason why Republicans should not have voted to confirm. The most energetic and elaborate efforts were made by the Administration and its close friends to secure Mr. Peckham's confirmation, but on February 16 the name was rejected by a vote of 41 to 32. Fourteen Democrats voted against Mr. Peckham and eight Republicans voted for him. Nothing in any way derogatory to Mr. Peckham's high personal character and professional standing was developed in the course of the long and almost bitter struggle. If the President is to be criticised at all for having made this nomination, it could be urged that the selection did not seem to be wholly free from political animus. It would have been perfectly easy to select a man with reference to no other consideration than an absolutely satisfactory provision for the vacancy on the bench. This is high ground, to be sure, but it is not unreasonable. Mr. Peckham's public career would not seem to have led naturally up to a place upon the Supreme Bench of the United States, although his career has been an honorable one, and one for which good citizens should be grateful. On the 19th, Senator White, of Louisiana, was named, and at once confirmed.

*Vindicating
an Honest
Ballot.*

The conviction of John Y. McKane ought not to have been a surprise, for the evidence against him was overwhelming. Yet so infrequent in this country is the adequate punishment of the criminal offender against the honesty of elections, that the friends of good government hardly dared to hope that the jury would bring in a unanimous verdict in the case of the Coney Island Boss. McKane had turned elections into a farce at Gravesend, and had filled the ballot-boxes with thousands of fraudulent names. He had sneered at court injunctions and defied the laws of the State. In his trial he was guilty of constant perjury, as were many of his witnesses. There was absolutely no partisan spirit displayed in his prosecution, and there was no difference of opinion as to his guilt or the propriety of a heavy sentence. While his trial was pending in Brooklyn, of which Gravesend is a suburb, the District Attorney's office in New York City was engaged in the prosecution of a number of Tammany heelers whose outrageous frauds in the last November elections were reported by watchers at the polls in various precincts. These watchers represented the allied non-partisan good-government movements of New York. Convictions have followed one another with a gratifying rapidity. There has been an

amazing improvement in the political atmosphere in the cities of New York and Brooklyn and in the States of New York and New Jersey, as a result of the past year's work for good government and of the tremendous display at the polls of popular indignation against corruption in politics.

Is Gladstone to Retire? A few days before Mr. Gladstone's return from his vacation at Biarritz, to be present at the opening of the new session of Parliament in the middle of February, the *Pall Mall Gazette* announced that it had authentic information to the effect that Mr. Gladstone was about to retire from public life. The statement created a genuine sensation, not only throughout the British Empire, but in every portion of the civilized world. Mr. Gladstone's reply was characteristic. It explained without reservation that the Prime Minister was suffering from a gradual failure both of sight and of hearing, and that in his condition, and at his age, it would not be strange if at any time he should be compelled to withdraw from the burdens of public office. But there was nothing explicit in his answer, and although we have received private advices which lead us to think that Mr. Gladstone's retirement is near at hand and is a matter that has been definitely provided for among the Liberal leaders, we can only await developments and meanwhile hope that the *Pall Mall Gazette's* report and our own information are premature and mistaken. The retirement of Mr. Gladstone from the domain of public life can hardly be realized as a possibility, so accustomed has every one become to thinking of the Grand Old Man as embodying in himself at least a full half of the political life of the British Empire.

War Upon the House of Lords. More important than anything done in the opening days of the new House of Commons was the spirit of the Liberal party as shown in the great annual meeting of the Liberal Federation which assembled this year at Portsmouth, and which declared itself in no ambiguous way against the further tolerance of the House of Lords as a law-making body. There are some hundreds of peers entitled to a seat and a vote in the House of Lords, only a few scores of whom have any affiliation with the Liberal party. But the people of the United Kingdom have placed the Liberal party in power; and have authorized it to enact legislation in the lines of its avowed programmes. The House of Lords existing as an hereditary body and being in no wise representative of the will of the majority of the nation, has taken upon itself the responsibility of creating a legislative dead-lock by refusing to pass the measures which have come up to it from the House of Commons. The Liberal party has long hesitated to enter upon the inevitable war that some day had to be waged against the hereditary house at the other end of the Parliament building, and the Lords have heretofore been careful not to carry obstruction to the point of bringing down upon their heads the wrath of the country. But now, it would seem, the memorable conflict is

to begin avowedly and in good earnest. It is not likely to succeed at once, but the Liberal party as a whole is now committed to the frank movement against the House of Lords that the extreme radicals have so long and so impatiently demanded, and there can be no retreat. It is probable that there will be a dissolution of the present Parliament and an appeal to the country within a very few weeks, and it will not be surprising if Mr. Gladstone's retirement should be announced in connection with the break-up of the existing Parliament.

Kaiser and Ex-Kanzler.

The most picturesque event on the Continent since the opening of the year has without doubt been the public reconciliation of the German Emperor and Bismarck. The Kaiser's autograph letter and present of wine to the aged statesman at Friedrichsruh, and the triumphal visit of the latter four days afterward to the Imperial Palace in Berlin, have enraptured the German capital,

THE RECONCILIATION BETWEEN PRINCE BISMARCK
AND EMPEROR WILLIAM.
From *Pall Mall Budget*.

and, on the whole, delighted Europe. The sight of the young Kaiser ardently kissing both cheeks of the grim veteran amid cheers of the enthusiastic populace touches something deeper, one must confess, than the dramatic imagination. That, and the cordial allusion to his guest in the Kaiser's birthday Rescript, will probably help to remove a sore place from the German heart, as well as to shed a warmer glow over the somewhat chill sunset of a stormy life. The reconciliation is said to be personal, not political; but where government is personal, a hard-and-fast line cannot be drawn between the two aspects. It should prevent the old man sticking journalistic pins into the

side of the young man, and so remove one source of national disquiet. Possibly the Kaiser may by this action have risen somewhat in the estimation of the Czar, which would in its turn help to strengthen the ties of international peace.

"The Peasant Emperor." The serious illness of the Czar, which is, happily, said now to be abating, has reminded the world with fresh vividness how momentous are the issues which hang upon that single life. With each rise in the temperature of the illustrious patient, the nations grew more and more feverish with apprehension. Had the influenza bacillus succeeded in vanquishing him, it would have won a gruesome victory for the demons of war. What, for example, might the squabble between rival dynasties, which has caused the crisis in Servia, have developed into if his pacific influence had been removed? The character of the great Peace-keeper of Europe is admirably illustrated in a story which M. de Blowitz tells in the *Times*. The Czar and his courtiers were engaged in discussing by what added title he should be known in history. His father had been called Alexander the Liberator and Alexander the Martyr. What should the son be called? "Alexander the Just," suggested the one. "Oh, no," replied the Czar, "I am and shall remain the Peasant Emperor. So some of my nobility have styled me in derision, scoffing at my affection for the moujik. But I accept the title as an honor. I have tried to procure for the humble the means of livelihood; and this, I think, is the best and only means of keeping the world going. After all, I believe that only two men have really known what Socialism is. Henry IV, who dreamed of giving every peasant 'a fowl in the pot;' and, perhaps, myself, whose greatest ambition is to save the Russian peasant from dying of hunger. For when people understand that they run no danger of starvation they begin to bless God, and end by loving the Sovereign who represents Him on earth. I am not among those who believe that the only way of ruling easily is to render the people powerless by privation and fear of the morrow. My greatest ambition is to deserve to bear to the last the title of the Peasant Emperor." The speech is "well invented" if not exactly a *verbatim* report—for the Czar is not given to making speeches of this length. The unconscious homage it conveys from the greatest Autocrat in the world to the spirit of modern Democracy is very impressive. It may be taken as a set-off to the extended activity in the Russian dockyards, and rumors of Russia acquiring from Greece a harbor in the Mediterranean. The potentate who looks at the whole political situation, national and international, through the window of the peasant's hut will be the last of men to consent to war.

France
Solidifying.

His more volatile ally in the West has been giving pledges in her turn of the anticipation of peace. France has decided on converting her government stock, amounting to £280,000,000, from 4½ per cents. to 3½ per cents.

This is a lengthy process which no country would undertake unless the danger of an outbreak of war were held to be very remote. There was a curious boggle in the Chamber over the use to which the annual saving of more than two and a half millions sterling should be put. Socialists and agrarians united in a majority of 280 votes to 240 to apply the sum to the reduction of the land tax. Then the Deputies by 403 to 70 decided to restrict the relief to land cultivated by its owners. The Government next refused to be responsible for carrying out this appropriation, which was therefore rescinded by a majority of 100. The defeat of eight reactionaries in the Senatorial elections in January is another proof of the growing attachment of France to Republican institutions. Much of this she owes to the Pope, who was again insistent on the duty of Catholics to be loyal to the Republic. His Holiness has apparently to pay for his Republicanism. For some time now Vatican accounts have shown deficits at the rate of \$20,000 a month; and the falling off in income is attributed to the resentment which the Pope's electoral advice has aroused in the breasts of wealthy French Royalists. There is a touch of humor in the suggestion that the Roman Pontiff is somewhat in the condition of a parson who has "riled" his rich deacons by "meddling with politics."

Anarchists
Still at
Work.

The manifold tendencies which France has to encounter in the forces of disorder are vividly illustrated in the fact that the month which opened with the arrest of 2,000 Anarchists in all parts of the country, sees toward its close a Deputy forcibly removed from the Chamber for crying "*Vive la Commune!*" Vaillant's trial, which ended in the death-sentence, was chiefly notable because of his posing as the logical executant of the ideas of "the Reclus, the Darwins, the Spencers, the Ibsens, the Mirabeaus." Whencesoever the ideas were borrowed, the execution duly occurred. The Governor of Barcelona, where the theatre bomb-thrower was arrested and confessed, has been shot in his face by an unsuspected workman. Finally, Paris has had another frightful sensation on February 12 in the explosion of a bomb in the *café* of the Hotel Terminus, by a young man who was promptly captured and whose name proves to be Emile Henry. Some twenty or thirty persons were injured and the building was much shattered; but the wholesale loss of life that was evidently expected by the assassin did not occur. It seems that Henry's record is far superior to that of Vaillant, and that he was well educated in one of the Paris colleges, where he bore an excellent name for ability and faithfulness. It is not true that the French Anarchists are all of the loafer and low criminal type, though doubtless most of them are. There is clearly a group of young men of good antecedents and of education that has become infected with this murderous and abominable heresy. Henry's conviction and execution will doubtless follow promptly after that of Vaillant. A very few days after Henry's crime, a young French Anarchist

named Martial Bourdin was killed at Greenwich, near London, by the accidental explosion of a bomb he was carrying with the supposed intention of blowing up the Royal Observatory. The London Police have raided the "Autonome Club," a noted resort of foreign Anarchists.

Italy in Revolt. Very different from this Anarchic "propaganda by deed" is the wave of insurrection which is sweeping over King Humbert's realm. Anarchist literature has indeed been found in Rome, but the peasants of the Sicilian risings have been demonstrative in their expressions of attachment to the Crown and to the Catholic religion. Nevertheless, the troops in several places have had to fire on the mob, martial law has been proclaimed in Sicily, and a general disarmament of the population ordered. Serious tumults have broken out in Naples, and also so far north as Carrara. The meeting of the Chambers has been postponed, Signor Crispi seemingly preferring to be unhampered by parliamentary criticism during the work of repressing disorder. These formidable disturbances have been attributed to the instigation of French political agents and to German Socialists; but there is no need to go so far for an explanation. The tremendous financial burdens which her armaments have imposed upon Italy are the principal cause of the imminence of national bankruptcy, the dislocation of commerce, and the crushing taxation which, long endured in silence, has at last roused the writhing peasantry to revolt. Militarism has reduced a people who enjoy a democratic form of government to a condition almost as insufferable as that of the French under the *ancien régime*.

Towards "Vrill." Yet Italy only represents in an acute form the misery with which the same pest infests Europe. The sore has broken out in the central peninsula, but the virus pervades the Continental system. Germany is turning desperately from one forbidden source of revenue to another to find new means to meet the cost of her latest increase in armaments. Everywhere in France, Austria, Germany one meets with the cry of agricultural depression. American competition? Certainly. And if this colossal sacrifice of labor and treasure to the War God goes on much longer Europe will find out, and with a vengeance, what American competition means! What chance of competing with a New Continent, which can scarcely be said to possess an army, where men may live and die without ever having seen a soldier—what chance has an Old Continent, staggering under a yearly increasing load of military taxation, half paralyzed with dread of imminent hostilities, and with no prospect save of heavier burdens and of a scientific massacre more complete? Less than a month ago the new explosive, Schnebelite, named after its pious discoverer, Abbé Schnebelin, was tested near Paris and found to possess enormous shattering and penetrative power; it is also almost

smokeless. Only the other day an Austrian inventor perfected an automatic mitrailleuse, said to spit forth death at the rate of 480 bullets a minute—eight per second. It is in rehearsing for the carnival of wholesale destruction which these explosives and weapons suggest that civilized Europe is trying to beggar herself. Is there no way out of this appalling *impasse*?

Europe the Prodigal. Disarmament? On the 11th of January, Mr. Byles asked Mr. Gladstone in the House of Commons whether the British Government could initiate negotiations among other European Powers with a view to concerted disarmament. Mr. Gladstone doubted whether the time was opportune, and the subject was dropped. So it appeared in England. But on the Continent, according to the *Times*—a journal not likely to exaggerate impressions of a humanitarian kind—the overburdened, all but despairing, military peoples have caught at the word. Disarmament! And eminent men and responsible men are talking about it. Is it possible? The eagerness which the mere mention of the idea—for it was little else—has evoked in Europe raises a great question, the very raising of which is suggestive of a great hope: Have the peoples of the Continent been reduced by the miseries of militarism to a state of genuine contrition? Are they really willing to be saved from the torture of an armed peace and the dread of an annihilating war? Europe has verily played the prodigal. It has wasted its substance on riotous armaments. It has devoured its living with unnatural alliances. Is the European mind on the point of coming to itself?

Wanted, a New Peter the Hermit. There are not a few signs of the moral desperation which, rightly guided, goads into a new and auspicious career. What seems to be the crying need of the hour is a great European leader, a truly international man, whom kings and statesmen and the common people in every land could trust, who, passing from Court to Court, from Cabinet to Cabinet, from one Bourse to another, could negotiate the general desire for peace into a permanent organization, who could charm national pride and sensitive national honor into loyal submission to a tribunal of international justice and international force. In default of such a modern edition of Peter the Hermit preaching the union of the nations in a crusade against war, Europe may have to wait the authoritative summons of the leagued English-speaking peoples, or the spontaneous resolve of the Continental proletariat, or the cruel dictate of mutual helplessness following on devastating war. But whatever be the occasion, the one condition of settled peace remains the same: The establishment of a Central Court, with power to enforce its sentence. Disarmament by mutual arrangement seems scarcely possible or wise, unless accompanied or preceded by this condition. Until a man knows that the law is strong enough to protect him from injury, he can hardly be expected to give up carrying arms; and

until nations know that behind the High Court of international justice there is material strength enough to prevent or punish the international aggressor, they are not likely in any fit of amiable enthusiasm to disband their armies and dismantle their fortresses. That condition observed, the difficulty ought not to be insoluble. Are the Powers willing to develop the concert of Europe, or such relics of it as survive, into a properly constituted judicial tribunal? If they are not willing, then there seems to be nothing for it but to let them burn in the hottest purgatory of militarism until such time as they shall be willing. A strange glint of coming possibilities showed itself last month in the Bavarian Diet. Two Ultramontane members, while denouncing the acceptance of the Army Bills, "proposed the institution of an international court of arbitration for the settlement of European quarrels, under the presidency of the Pope." His Holiness is said to be preparing an encyclical on the general question.

*A Tragic
Christmas
Eve.*

Possibilities of a different kind were suggested by the news of fighting having occurred between French and British troops in West Africa. It was a sad story of military misadventure. Away in the Hinterland of British Sierra Leone and of the neighboring French Colony, have been roaming for some time tribes of savage

THE LATE LIEUTENANT MARITZ.

marauders, who live by murder, robbery, and selling their captives into slavery. To punish these Sofas, expeditions had been sent from both French and English bases. The French leader, Lient. Maritz, with some thirty Senegalese sharpshooters and 1,200 native auxiliaries, pushed his way on the track of the Sofas, and, not coming up with them on French territory, pressed into the British Hinterland as far as two day's

journey. At last, on the night before Christmas Eve, he concluded that he had found the enemy's encampment. In the black faces of the troops and in the white robes of the officers, as he saw them in the bright moonlight, he thought he recognized the Sofa clan. Accordingly he made a surprise attack, but found to his mortal cost that he had attacked the British force. It consisted of 430 men of the West India Regiment and some hundred of the frontier police, commanded by Colonel Ellis. In the struggle which ensued the French were repulsed, ten of their number slain, and their Commander was brought dying into the British camp. The poor fellow managed to explain his mistake before he died. But the mistake had cost the English the lives of three officers and seven men, and the disablement of eighteen other men. There seems no doubt that the French lieutenant was entirely to blame for the occurrence. No international complications are expected to result.

*Crushing the
African
Slave Trade.*

It is gratifying to know that this sad blunder did not long check Colonel Ellis' punitive purpose. He left Warina—the scene of the incident—on December 26, followed the trail of bloodshed and ruin which the Sofas had left behind them, and coming up to their blockaded camp early on the morning of January 2, did precisely what Maritz had intended to do—took the place by sudden storm. Two hundred of the Sofas were slain, 70 taken prisoners, and more than 400 slaves, women and children, were rescued from their captors. Colonel Ellis reports that the horde of slave-raiders is now completely dispersed. In British Central Africa, Commissioner H. H. Johnston has at last succeeded in capturing the strongholds of Makanjira, a noted slaver, near Lake Nyassa, and in liberating a number of slaves.

*The New
South African
State.*

The subjugation of Matabeleland seems to be approaching completion. Of the fate of Captain Wilson and his thirty comrades there is no longer any possible doubt. They fought till their ammunition was spent, and then were speared as they were writing their last messages for friends at home. Lobengula refused to accede to the wooing invitations of Sir Henry Loch. He preferred to keep well to the north with a thousand or two of his soldiers. He put to death the induna who commanded the slayers of Wilson's party. General Goold Adams reports, after investigation, that his troops were not to blame for shooting Lobengula's envoys who came to the camp to treat at the beginning of the war. The responsibility is laid on Mr. Dawson, who accompanied the indunas, but did not sufficiently early explain their intentions. King Khama, charged with deserting the Imperial forces, has also been acquitted. The victorious Company volunteers are receiving their 3,000 morgen each of the conquered land. The happy hunting grounds of Lobengula are being rapidly annexed to civilization. Mr. Rhodes has returned to Cape Town, and has been enthusiastically fêted. He has taken the

opportunity to declare that he did not want the war, and had done everything he could to prevent the war. But having had no alternative but to fight, he congratulated the Company on the swift success and great result which the arms of their volunteers had won. He indulged in some severe strictures on Mr. Labouchere and the Aborigines Protection Society, and deprecated the danger of the Home Government interfering with the South African ideal. He looked forward to founding a State in Matabeleland which should be one of the largest and richest in South Africa. It is stated that Sir Henry Loch and Mr. Rhodes have come to an agreement as to the settlement of the new territory, safeguarding the rights of the natives and yielding them the requisite quantity of land. As Mr. Rhodes intends coming to England this month, the respective claims of the Cape Colony, the Chartered Company and the Imperial Government will probably soon be definitely adjusted. Lobengula's death has been reported, but the news awaits confirmation.

THE LATE SIR GERALD PORTAL.

The opening of 1894 has taken away two famous African pioneers—one, Sir Samuel Baker, gathered at the ripe age of seventy-three; the other, Sir Gerald Portal, cut off in the flower of his manhood, in the very midst of what many had hoped would have been a long as well as a brilliant career.

The French and the Hovas. The French, who are claiming the whole Sahara, and have just been engaged in taking, losing and retaking Timbuctoo, do not seem to be particularly enjoying their protectorate of Madagascar. The Hovas have never acquiesced in it. They have tried to limit it to the mere supervision of their foreign policy; and they have distinctly not welcomed French settlers or concessionaires. The friction, which was very acute a year or two ago, has again become menacing. There were interpellations last month on the subject in the French Chamber, and though the idea was abjured of sending an expeditionary force, a special resolution was passed to sustain the Government in maintaining French

rights. Already the Hovas have sent a delegate to consult with Mr. Rhodes.

The Khedive's Cantrups.

As the Hovas seem to be bent on making matters rough for the French, so the Khedive seems disposed to give England as much trouble as he can. While inspecting the frontier troops at Wady Halfe, he so lauded the regiments officered by Egyptians, and indulged in such vituperation of the regiments commanded by English officers, as openly to insult the latter. This led at once to General Kitchener, the British chief of the Egyptian army, resigning his post. The Khedive now found himself in a difficulty, and had to beg the offending general to withdraw his resignation. He was also obliged by Lord Cromer to dismiss Maher Pasha, Under-Secretary for War, who is said to be responsible for the Royal escapade.

Nostrums—Western and Eastern.

Lord Lansdowne's farewell from the native population as he left India was not very cordial; and his attitude towards the movements characteristic of the new India may be gathered from his parting warning against pouring Western nostrums down Indian throats. The difficulties which the Mikado of Japan has been experiencing in the working of his recently adopted Parliamentary system supplies an example in illustration of the ex-Viceroy's contention. Lord Elgin, who replaces Lord Lansdowne as Viceroy of India, is believed to be specially likely to conciliate native affection. The silver difficulty seems to be growing

THE MARQUESS OF LANSDOWNE, G.C.M.G.

more acute. India Council bills are now to be sold for what they will bring, the Government having failed to check the decline of the silver rupee.

Well
Caught.

The fact that has done most to turn the eyes of the British world in the South American direction of late was the arrest of Jabez Spencer Balfour, the heavy villain of the

CAUGHT!

CAUGHT!

JABEZ S. BALFOUR.

(From *The Westminster Budget's* Portrait.)

"Liberator" Building frauds. He was apprehended by Consul Bridgett at Salta, in the Argentine, where he had taken a brewery. An officer from Scotland Yard has gone to bring him home. An extradition treaty has just been concluded, but under what precise legal formula his transfer to England is to be effected will doubtless be duly declared when he is put on trial. Meantime, it is said to be due to an "act of international courtesy." So once more Lord Rosebery scores.

Work
and
Relief.

The condition of the unemployed is not materially changed. In some lines of industry there has been improvement, but the total number of workers now in enforced idleness can hardly be said to have diminished within a month. Relief work in almost all of our centers of industry has become fairly well organized, and it is evident that the necessity for such special provision for the destitute will continue through some weeks yet to come. The police department of New York has made a census of the unemployed and has found nearly 50,000 families whose bread-winners to the number of

nearly 70,000 are deprived of their usual work and wages. It is probable that this census is a considerable underestimate of the real situation, but it is certainly appalling enough. We are in receipt of an admirable statement from San Francisco showing great energy and success in the work of relief at the Golden Gate. Our extended survey last month and the month before would sufficiently indicate the various methods employed in the different cities to accomplish the same end of tiding over the period of emergency without humiliating or pauperizing those requiring relief. In this issue we present a brief report from Col. Tracey, United States Superintendent of Charities of the District of Columbia, regarding relief work in Washington, and a very interesting account from Mrs. Williams' pen of Clara Barton's "Red Cross" relief campaign on the Carolina Coast.

The Death
of Geo.
W. Childs.

The death of Mr. George W. Childs, the distinguished proprietor of the *Philadelphia Public Ledger*, has called forth eulogies upon his noble life from the press of all civilized countries. His career was one full of lessons to young Americans. He won his high position by faithful adherence to high ideals early formed. He found his great happiness in the performance of good deeds and in the life of a model citizen. He gave his sympathies wide range, and thus grew in knowledge and power and in a constantly enlarged circle of friendships among those best worth knowing in all lands. Elsewhere we are glad to be able to publish an article upon the method and scope of his work as a philanthropist.

In the
Educational
World.

The University of Nebraska has celebrated its twenty-fifth anniversary. It has grown into a position of maturity and strength that has secured for it wide recognition as one of the leading institutions of America and one of the greatest universities of the world. The growth of its student body and of its scientific and advanced work has been especially notable under the direction of the present accomplished and energetic head, Chancellor James H. Canfield. This State University, with those of at least five other Western States, will henceforth have little reason to shrink from a comparison with the leading institutions of the older States east of the Alleghanies. Cornell University,—which in its history and in the spirit and method of its work would seem to belong to the group of which the University of Michigan is the most conspicuous member, rather than to the Eastern group,—has lately celebrated, with many evidences of its gratitude and esteem, the eightieth birthday of the President of its Board of Trustees, the Hon. Henry W. Sage, whose gifts have constituted him its greatest and most constant benefactor. Its prosperity under President Schurman is attracting very wide attention throughout the country. The cause of the higher education of women has suffered a sad loss in the death of the President of Wellesley College, Miss Helen Schafer. As a teacher and as an executive officer her work has long commanded the highest respect, and her memory will be treasured.

RECORD OF CURRENT EVENTS.

January 20.—The President submits to Congress further details of the Hawaiian difficulty....The President vetoes the New York and New Jersey Bridge bill....Amendments to the Tariff bill defeated in committee of the whole....Efforts made to wreck trains in Pennsylvania and Ohio....All Europe discussing a general disarmament; Great Britain expects to find an ally in Italy....Italy is comparatively quiet once more; Anarchists around Carrara cannot be found by the troops....A military dictatorship in Servia regarded as probable; Milan is on the frontier, ready to enter.

January 21.—Strikers among the employees of the traction company and their sympathizers riot in Bridgeport....Gen. Saraiva enters Rio Bay with 8,000 insurgent troops....The crisis in Servia becomes grave; the Radical Ministry resigns at Milan's entrance into the country; it is believed he intends to take supreme command of the army; in that case civil war will ensue....The condition of trade in India is critical as a result of the money question; the Indian Council has decided to sell bills below the former minimum price of 15¼ pence....The German government is hopeful of passing its tax measures, in spite of the powerful coalition in the Reichstag against them.

January 22.—Wheeler H. Peckham nominated for the Supreme Bench....An internal revenue bill including the income tax reported to the House....The sugar schedule of the Tariff bill defeated; amendments abolishing the bounty system and placing refined sugar on the free list carried....Boss McKane's trial begun....Milan accuses Servian Radicals of many misdeeds; Alexander offers them the conditions on which they may return to power and which they refuse....Brazilian insurgents seize a large store of munitions and money....Chihuahuan rebels defeated....The disarming of peasants and workingmen going on in Sicily....A number of meetings held in Berlin to consider the condition of the unemployed....A number of marine disasters reported....The British have cleared the Sofas out of Sierra Leone.

January 23.—All sugars placed on the free list by action of the House....Governor Werts proposes that the Supreme Court decide at once on the New Jersey Senate deadlock....Bismarck and the Emperor have settled their differences and will meet next week; Crispi is believed to have brought about the reconciliation....Insurgents win some advantages in Brazil.

January 24.—It seems likely that the income tax will pass in spite of the bitter war made upon it....The committee accepts other amendments to the Wilson bill....The New York State Senate adopts the closure rule by party vote....Two dams break near Rotterdam, N. Y., doing great damage....Admiral Benham interviews da Gama on the subject of arbitration in the Brazilian war....Servia's new cabinet received with hostility and driven by jeers out of the Skuptschina; the decree of banishment against Milan and Natalie canceled....The Belgian explorers, D'hanis and Ponthier, killed by natives in the Congo Free State.

January 25.—Democrats in caucus agree to attach the income tax to the Wilson bill; New York men begin the battle against the tax in the House....Senator Platt's Senate declines to execute his mandate....The North River Bridge bill will be amended to accord with the

President's objections....The civil governor of Barcelona shot by an Anarchist....The French occupy Timbuctoo....The Khedive must apologize to England for his insulting remarks concerning her troops....Fifteen people killed in a Russian railroad accident.

January 26.—Free tin plate defeated in the House; the Tariff bill passed upon as far as lumber....The House Judiciary Committee adopts the resolution against the bond issue proposed by Secretary Carlisle; meanwhile the Treasury balance falls lower as the days go by....Prince Bismarck's visit to Berlin an ovation from Emperor, Princes and people; a complete reconciliation effected between him and the Kaiser....Troops recalled from Sicily, but still stationed at Carrara....Two more Anarchists implicated in the plot to kill the Governor of Barcelona caught....The Khedive, at Lord Cromer's instance, publishes his apology to the British Government.

January 27.—Foreign miners, Huns, Slavs, Poles, etc., riot through the coal regions of Northwestern Pennsylvania; they commit robbery, arson and attempt murder; after a long chase sixteen are captured....Gov. Tillman calls out the South Carolina militia to enforce the Dispensary law....The California Midwinter Fair formally opened....The tariff debate extended; February 1 is fixed as the date for the final vote; sweeping reductions made in the iron and steel schedules....The amount appropriated for pensions in the current fiscal year is \$166,531,350....The Socialists in the French Chamber cause an uproar and are compelled to withdraw from the house....England's new battle ships unfitted for the work expected of them; £7,000,000 will be spent on the new navy....Kaiser Wilhelm brilliantly celebrates his thirty-fifth birthday....Honduras invades Nicaragua.

January 28.—Secretary Carlisle assures New York bankers that the validity of his bonds is not disputed....Troops in Charleston, S. C., sleep on their arms in fear of an outbreak....Fire in Bath, Maine, destroys property to the value of \$400,000....Riotous coal miners said to be preparing for another outbreak in retaliation for their first defeat....7,000 potters idle in Trenton....The meeting between Bismarck and the Kaiser has no political significance; Bismarck much pleased with his reception....Carnot refuses to interfere in Vaillant's case; the French in Timbuctoo attacked by Touaregs.

January 29.—Twenty-two rioters arrested in the Pennsylvania coal regions; they succeed in intimidating the men at work in one mine....Gov. Tillman threatens to give the people of Charleston "all the bloody riot they want"....Representative McMillin, of Tennessee, opens the debate on the income tax....Insurgents make a successful attack on Born Jesus Island, capturing government works and ammunition....The American Legation in Rome robbed; much wanton destruction done....Twenty Anarchist rioters wounded in an encounter with Zürich police....Twenty-six lives lost in a wreck off the Irish coast.

January 30.—Da Gama fires on an American merchantman at Rio and Admiral Benham promptly sends a shot into the rebel flagship; Da Gama wishes to surrender, but his younger officers bitterly oppose it....The special congressional elections in New York result in the election of one Democrat and one Republican; a Democrat is elected in Virginia....The injunction against the bond

issue denied ; New York banks subscribe for a portion of the loan . . . M. Lockroy scores the French navy and naval administration in the Chamber . . . Marine disasters frequent on European shores

January 31.—The income tax clause attached to the Tariff bill by a vote of 175 to 55 . . . The bond issue attacked in the Senate, in spite of the fact that the Treasury balance is continually decreasing, having now reached \$65,000,000 . . . Ten committees from the New York legislature to investigate various matters throughout the State ; the police investigation will begin immediately . . . Mr. Gladstone intimates in an open letter that he is soon to retire . . . Our merchantmen may now land their cargoes at Rio without fear . . . Portugal has sent forces to quell tax riots at Oporto.

February 1.—The Wilson bill passes the House by a vote of 204 to 140 ; the income tax amendment adopted . . . Official dispatches received from Rio on the *Detroit* incident ; Secretary Herbert cables his approval to Benham . . . The French government denies M. Lockroy's charges as to the state of naval affairs . . . The disaffection due to burdensome taxes in Portugal not confined to Oporto ; Lisbon also affected ; rioting in Oporto quieted by presence of war vessels.

February 2.—Bitter feeling over the Dispensary law ends in bloodshed at Columbia, S. C. . . . The House begins a three-day debate on Hawaii ; the Tariff bill referred to the Senate Finance Committee . . . McKane takes the witness stand in his own behalf . . . Negotiations for arbitration continuing in Brazil ; Da Gama's position growing worse . . . John Redmond attacks Liberal rule in Ireland . . . King Behanzin has surrendered to the French.

February 3.—Bland's bill to coin the silver bullion in the Treasury submitted to the House ; the House discusses Hawaiian affairs . . . A large fleet of warships will be sent to patrol Bering Sea . . . The Committee on Appropriations is at work reducing expenditures . . . Quebec ends her week of midwinter carnival . . . Belief that Gladstone will retire, growing ; both parties preparing for an early election . . . Bismarck's political attitude is changed by his reconciliation with the Emperor ; the tax and Russian Treaty bills certain to pass the Reichstag . . . Crispi asks for plenary power to carry out numerous administrative reforms.

February 4.—Two men killed by Tillman's officers in making arrests for violation of the Dispensary law ; it is claimed they fired without cause or warning . . . Two persons killed and thirty injured in the wreck of a church caused by a wind storm near Birmingham, Ala. . . . Senator Quay hopes to defeat the Wilson bill by adding silver amendments . . . Gen. Campos arrives in Morocco with the Spanish mission to the Sultan.

February 5.—Gov. Waite triumphs and the extraordinary session of the Colorado legislature is at last doing business . . . Da Gama gives forty-eight hours' notice of his intention to blockade Rio ; the action of foreign commanders awaited with anxiety . . . Vaillant, the bomb thrower, guillotined at Paris . . . Italian Anarchists about Carrara sentenced to penal servitude by court martial . . . British troops again fired upon by French troops in Sierra Leone.

February 6.—The Senate Finance Committee will give no hearings on the Tariff bill, in order to expedite its passage ; the House in a deadlock on the Hawaiian resolution, due to absentees . . . Four men killed in Virginia in a fight between marshals and moon-hiners . . . McKane continually contradicts his own statements in his trial . . . George W.

Childs buried in Philadelphia . . . Peixoto offers amnesty to rebels . . . Marine disasters reported from London, Glasgow, Oporto and Halifax . . . The text of the Russo-German treaty published, giving Germany, under the "favored nation" clause, the same rights recently conferred on France.

February 7.—The Federal Election Laws Repeal bill passes the Senate, 39 to 28 . . . The House passes the McCreary resolutions on Hawaii upholding the Administration policy by a vote of 177 to 75 . . . The Greater New York bill made a special order for the Assembly . . . Another World's Fair fire destroys part of the Agricultural Building . . . The Presidential election in Brazil will take place on March 1 ; Moraes, the only candidate, and agreeable to both parties ; President Cleveland to arbitrate the boundary dispute between Brazil and Argentina . . . Consternation reigns in the silver and rupee markets.

February 8.—The famous old corvette, *Kearsarge*, founders off Roncador Reef ; the officers and crew saved . . . The President signs the Federal Elections Law Repeal bill . . . The Senate Committee making extensive changes in the Tariff bill ; sugar and iron to be restored to the dutiable list . . . The bill for submitting the question of a greater New York to a vote of the people passes the Assembly . . . Bland's Seigniorage bill before the House . . . The French force at Timbuctoo said to have been wiped out . . . Agitation against the House of Lords beginning in England ; Gladstone's eyesight failing . . . The Shereef objects to Spain's demands . . . Lobengula a lonely wanderer in the bush.

February 9.—The gold reserve again intact from sale of the new bonds . . . A debate on silver under way in the House . . . Two train robberies occur in Texas and Nevada, both successful ; train derailed in one case and the flagman shot . . . A report circulated in Paris that the American Minister to Turkey has demanded the release of two Armenians and threatened to send an ironclad to their place of imprisonment . . . An alleged plot to assassinate Peixoto discovered at Rio . . . The Indian money market in a very unsettled condition . . . Not all the French force at Timbuctoo was killed ; the government will send immediate relief.

February 10.—Evidence appears of a combination of iron, coal and sugar Senators to prevent the placing of those articles on the free list . . . Four fires of incendiary origin occur in the White City . . . The Russo-German treaty finally signed . . . Insurgents at Rio attack Nictheroy, gaining slight success . . . Anarchists still active in Europe . . . Many marine disasters continually reported . . . Lobengula said to have died in the bush.

February 11.—Colt's firearms factory burned in Hartford, with a loss of \$250,000 . . . Brazilian rebels repulsed in their attack on Nictheroy, but they inflict severe losses on the government forces and destroy the position . . . Liberals in England again arousing themselves for an attack on the House of Lords . . . Count Schouvaloff's congratulatory speech on the *entente* between Germany and Russia regarded as a blow to France . . . Gen. Dodds placed in command of the French Soudanese forces . . . Spain makes a demand for prompt action on the part of Muley Hassan, and prepares to enforce it . . . Cholera reappears in Constantinople.

February 12.—A violent storm raging over the northern section of the country ; a cyclone in Mississippi destroys the village of Newtown ; a furious gale does much damage to life and property in Great Britain . . . More Hawaiian correspondence sent to Congress ; President

Dole uneasy over the attitude of this government.... Petitions against the Wilson bill presented to the Senate Another Anarchist outrage occurs in a Paris restaurant; a bomb thrown by a workingman, Breton, in Hotel Terminus, wounding twenty persons, five severely Brazilian insurgents attack Armacao, drive back the

New President of the Royal College of Physicians, England.

government troops and retreat, on the arrival of reinforcements for the enemy, after spiking their guns.... It is said that Mr. Gladstone intends shortly to appeal to the country.... The Khedive eating humble pie.

February 13.—Thirteen men entombed in a coal mine at Plymouth, Pa., without apparent chance of rescue.... Republicans make gains in the election of County Supervisors throughout New York State.... Senator Gray defends the Administration's Hawaiian policy in the Senate ... The Paris bomb thrower endeavoring to conceal his identity.... Agitation against the House of Lords increasing daily.... The storm in Europe causes great damage to property on land and sea and much loss of life.... Many Armenians killed and wounded in riots at Yuzgat, Turkey. De Lesseps made honorary President of the Suez Canal Company.

February 14.—The Senate Committee cutting down the free list in the Wilson bill.... Bland endeavors to close the debate on his seigniorage measure.... Another World's Fair fire of incendiary origin is discovered before much damage is done.... The work of rescuing the entombed miners at Plymouth dangerous; the rescuers compelled to stop at one place.... Sir William Harcourt declares in a speech before the National Liberal Federation that the Lords will not be allowed to override the popular will.... The Paris bomb thrower discovered to be Emile Henry, a young workingman, for some time past affiliated with Anarchists.... A number of arrests made in Warsaw of persons implicated in an alleged plot against the Russian government in behalf of Polish freedom.... The hurricane in Northern Germany has caused large loss of life.

February 15.—Bland again fails to fix the limit to the debate on his bill.... John Y. McKane, the Gravesend (N. Y.) boss, found guilty of election frauds and intimidation ... Wheat, after depreciating in price for some weeks past, reaches the lowest point ever known in this country.... The Senate Tariff bill will carry revenue enough to meet expenditures.... Yellow fever has appeared on

the Newark at Rio; Admiral Benham orders her to Montevideo; a launch from the cruiser fired upon by a Brazilian vessel.... An Anarchist in London blown up by his own bomb; evidence discovered of a conspiracy in which a number of persons are implicated, and of which the recent Paris outrage was the outcome.

February 16.—The nomination of Mr. Wheeler H. Peckham, to fill the vacancy on the Supreme Bench rejected by the Senate by a vote of 41 to 32.... Robbers ditch a train on the Southern Pacific near Los Angeles, shoot three men and loot the express car of \$20,000 Forty German sailors instantly killed by an explosion of a steam pipe on the warship *Brandenburg*.... The Commons will ignore, under the Speaker's direction, the amendment of the Lords to the Parish Councils bill, claiming the action of the latter to be unconstitutional... London police raid the Autonomie, an Anarchist club.... France recalls her Minister to Portugal, the trouble arising from Portuguese railway securities In the absence of an American warship, Nicaragua seizes the Mosquito country, a narrow strip along the Atlantic seaboard.

February 17.—Secretary Carlisle in conference with the Senate Committee on the Tariff bill ... Our warships leave Rio harbor on account of yellow fever.... Trade and industry improving in Great Britain.... Forty-six men dead from their injuries on the *Brandenburg*.... Von Caprivi will establish a national army in Poland.

MR. CHILDS IN HIS PRIVATE OFFICE.

CHILDS, THE GIVER.

BY TALCOTT WILLIAMS.

ANY man who reads French, English and American newspapers has probably noted that gifts to public purposes of 100,000 francs, of £10,000 and of \$100,000 will receive about the same space and attention in each. It would doubtless be a mistake to assume that this is a measure of giving in each country. It does furnish, however, I think, a rough and ready gauge of the extent to which giving in large sums and small is practiced in each country. Giving for public or private enterprises is not great in France, in spite of the very large sums collected by highly successful Catholic missions, of which Protestants never hear, the expansion in church building and the recent additions to educational endowments. The aggregate giving in England must run close to the United States. Their mission expenditure does. The six new endowed bishoprics, the enormous church building in the Victorian period, reaching \$20,000,000, I believe, and the large number of new foundations in charity, education and libraries all witness to an

activity in giving whose aggregate must remind Americans that they have no monopoly of this virtue. The religious aggregate of free gifts in Great Britain, put by the Nonconformist and Independent a few years since at £8,000,000, to which must be added the Church of England revenue of £5,750,000, say \$70,000,000 in all, represents an aggregate annual outlay which, relative to population, half ours, must run close to the sum used in supporting our 142,256 churches in 1890, worth \$631,221,303, an increase of \$444,000,000 since 1850, or over \$10,000,000 a year on church extension alone. Educational gifts are far larger here. So is local beneficence. In charities there is no path to comparison. I judge English givers are more regular and continuous. In one large Philadelphia charity I know that in two years it was found that 46 per cent. of the givers dropped off unless special effort was made to secure renewals. One of the richest men in the United States, perhaps the richest, on his mother's death declined to continue

her subscriptions to various New York charities. I doubt if an Englishman of like position and means would have done that.

From his latest photograph, by Gutekunst, Philadelphia.

MR. GEORGE W. CHILDS.

Whatever may be the measure of aggregate free gifts in the two great English-speaking nations, it is at all events certain that giving bulks larger in the perspective of American life than in any other country in the world. Public opinion resents a failure to pay this pious probate duty when a great estate passes by death from hand to hand, and every rich man of conspicuous wealth is under a constant pressure to give, of whose character, extent and persistence few are aware unless personally subject to it or called to its close inspection by a newspaper man's knowledge of the social machine. I do not refer to begging letters, but to the fact that around every rich man of even moderate means there is a band of men and women interested or at work in church, charity, education and general beneficence who are always directly or indirectly suggesting or securing gifts. There could be no better proof of this than the secrecy which those of means are perpetually impressing on the almoners of their bounty.

This situation gives an interest of its own to the death of a man like the late Mr. George William Childs, better known as an individual giver than any man in the United States. The head and manager of the *Public Ledger* in Philadelphia, in which he owned a third interest, or at all events one less than

half, Mr. Childs did not die a rich man, speaking relative to his opportunities. Local estimates, which generally err in exaggeration, put his wealth at \$1,250,000. Born a poor boy, who began self-support at twelve years of age, Mr. Childs had at thirty-five a competence, won as a publisher who dealt liberally by authors. In 1864 he bought the *Ledger*, then losing about \$150,000 a year. With the assistance of the Drexels, Mr. Childs paid for the paper and spent the capital needed to tide the paper over his brilliant plan of raising its price from one cent to two and increasing its advertising rates. In a few years it became and for over twenty years continued a paper paying a net yearly profit of from \$350,000 to \$400,000. For its expenditure it was one of the most profitable papers in the world. Returns like these would have made Mr. Childs, if he had followed the ordinary acquisitive course of rich men, a man of conspicuous wealth. As it was, there are over 200 estates in Philadelphia, a place of about 1,200,000 inhabitants at the time of his death, reputed as large as Mr. Childs'. He was content all his life to be a man with a large income, but a small fortune. This was not merely because he gave away an enormous sum in relatively small amounts. It was not possible for a man to give loving and laborious attention to the business of giving, as Mr. Childs did, and be as successful in the work of acquiring as other men. If you train your mind in one direction, it will not respond in another. Giving as constantly, continuously and systematically in manifold gifts as Mr. Childs did, inevitably absorbed a time, attention and energy which other men, even great givers in large single gifts, devote to the accumulation of a fortune by speculation, investment and accretion. Yet, Mr.

From photograph by Gutekunst.

MR. CHILDS IN 1867.

Childs was a business man of the very first ability. He had the gifts both of administration and of investment, both of getting and keeping, which are the twin abutments of overarching fortune. His life offers a typical example of a man with a great gift at creating wealth—for great fortunes are not made by taking out deposits which leave the soil poorer, but by transmuting the waste of nature into the wealth of man as the dynamo does—who chose, instead of using this gift to fill a reservoir, to expend it in a constant stream of beneficence, so that his remarkable money-making gift was used to bestow yearly, weekly and daily on others. When he came to the close of life and reached the fatal sixties of our taxing American careers, his only personal anxiety as to his personal discharge of the duties which lie beyond death seems, so far as one can judge, to have been a desire to leave his wife—he was childless—with the means to live as she had done for many years, and with the ability to continue those stated personal gifts on which a number of persons had become dependent. He impoverished his heirs by no posthumous benevolence, and his gifts in life were all, as far as he could make them, complete in themselves and calling for no further expenditure.

His life offers an example almost unique of the daily consistent application of great business ability to the task of distributing as well as of acquiring wealth. It is no exaggeration, perhaps the reverse, to say that Mr. Childs, for the last half of his life, put more time, labor and pains into the work of giving than he did into making money. His gifts began in his business. In his composing room he paid 5 cents a thousand above the "Union" price. He continued his own rate of wages when the Union reduced its scale. Those called into close connection with the *Ledger* chapel testify that this was a good business investment. It gave the *Ledger*, for the first twenty or twenty-five years of his ownership, picked printers. Pay was high, cases were permanent and chapel rules easy. Mr. Childs could take the pick of the trade. He put one woman at the case, almost the only one ever heard of in a big daily morning paper—as he could do, having the absolute control high wages gave—and her presence banished the foul language, the oaths and the personal slovenliness into which all men, educated and uneducated, gentle and simple, professional men and mechanics degenerate without women. The danger of this system of permanence and pay was that as the years went on the old and incompetent would be left. This was met by pensions. How early these began is best shown by the fact that while Mr. Childs owned the *Ledger* but thirty years he had paid one of these pensions for twenty-six. The waste of careless work was almost eliminated by this system of selection and the enormous advantage secured of willing work in the many emergencies of a daily newspaper. At the same time one must add that among other printers there has been of late years a belief that as the force in the *Ledger* aged it was not as efficient as it once had been. When the introduction of type-setting ma-

chines raised the most difficult of all industrial problems, the ethical duty of an employer to those displaced by new methods—of good to the community, of dire disaster to men past forty, too old to learn a new trade or profit by the general uplift of another milestone in the labor-saving march—Mr. Childs met this, after conference, by retaining all the married men in the new work and referring introduction

COLORADO SPRINGS, COL.

for a year, in which other men could find new places, while the men reduced their pay so as to divide the loss of the postponement of cheaper methods.

The level of pay in the *Ledger* office, which was maintained in all departments, was supplemented by gifts at each Christmas to all employed from the top to the last office boy. Those gifts, graduated by salary, ran from \$1,000 down a year ago and were always treated and spoken of by Mr. Childs as an equitable form of profit sharing. "They help me make my money, why shouldn't I give it to them," was his favorite phrase in explanatory reference to this annual gift; but this was by no means the measure of his giving as employer. He was perpetually aiding those on his pay-roll in advancing money to buy a house, which the free-hold system in Philadelphia makes easy, in aiding them to carry investments, in educating children and in all the manifold accidents and incidents of life. No patriarch in an Arab camp, the solitary stay and bond which kept the tribe together, ever entered more closely into the family and personal life of each than did this shrewd, keen money-making American into the homes of all those who made up the industrial unit of which he was the head. Contract was the least of the bonds which united employer and employed, and a feeling of common interest existed for 30 years unbroken by conflict or even friction.

Mr. Childs owed his earlier fortune to his success as a publisher and his later affluence to his profits as a newspaper proprietor. Through life he made himself the special providence of authors and printers, guided by his own personal relation and profit. How many he aided no one but himself knew. For years

he paid to two aged literary workers, honored in letters, £100 annually as regularly as if they had been on the meagre list of literary pensioners in the civil list of the British Empire instead of on the private pension docket of an American citizen. A New England poetess whose verse has one immortal idyl of homely industry received \$200 a year until her death. These are solitary instances of a large number. Loans were as numerous. It happened in the closing months of Mr. Childs' life that his mail brought a letter from a man, whose name figures on the title-page of more than one history, regretting his inability to pay the interest on a loan of \$4,000. It was one of those cases where the unprejudiced bystander, Mr. Childs' almoner, felt that there was an undue readiness to take advantage of Mr. Childs' generosity. "Don't you think it would be better to cut his name from the note and send it to him," said Mr. Childs, busy with the scissors, and clipped it was. The children of more than one literary man had occasion to find in Mr. Childs a friend of those who had only the claim which comes from having inherited the improvidence without the genius of their parent. Loans, yearly payments, in at least one instance, the money to establish a business, which supports the owner without reimbursing the advance, all came from Mr. Childs to those who had on him no claim but his own interested readiness to discharge the general debt to letters and to the public service of the journalist.

For printers Mr. Childs early bought and endowed the lot given to the Typographical Union of Phila-

NEGLECTED OFFICERS' TABLET AT WEST POINT.

delphia in Woodlawn cemetery, whose entrance is represented in this article. With Mr. Drexel he gave \$10,000 to the building of a home for disabled printers in Colorado Springs, Col., for whose construction and support each Union printer is expected to contribute 1,000 ems of composition annually. From this and

other sources the fund given in 1886 grew, and the building shown in this article was erected in 1891. Both gifts were intended by Mr. Childs to recognize his approval as an employer of organized labor. Nor must it be forgotten that the high rate of wages and the relatively low rate for advertising which he maintained made business rivalry difficult, and played its important part in securing to the *Ledger* its long monopoly of the profits of a fruitful field. This could not have been Mr. Childs' only or chief motive. He may have been altogether unconscious of it. But the fact ought not to be omitted in considering the economic and industrial relations of the policy here pursued, a policy as benevolent in business as in charity, and as profitable in one field as it was successful in the other.

Business aid to less successful business is a form of charity or usury which nearly all successful business men practice, each after his kind. It is a pretty story, which has the double merit of being both interesting and true, that Mr. Childs noted that the lights burned late in the windows of a room in the *Ledger* building leased to a modest manufacturer. A visit was paid, money advanced, the business expanded, a long business battle ended in success. I do not know what Mr. Childs made. I know that when the man whom he found with his apron on died the other day his estate proved at \$500,000. A theatrical manager in town failed in that dire period of disaster and transformation for the American stage from 1870 to 1880. Mr. Childs was a creditor. He had the best of all reasons for knowing that no security was left. He advanced \$10,000 to his bankrupt debtor without any security. The loan was repaid in after years of business success, which made the man a wealthy proprietor of a provincial theatre. But this was the exception. Mr. Childs once told me that he had paid out \$80,000 to various actors, managers, musicians and play-wrights which had left nothing but gratitude and not always that. Aid in starting men and women in business, where the business was small, the sum not large and the risk circumscribed, Mr. Childs advanced in scores of cases—how frequently or to how large an aggregate amount no one but himself knew.

But his most important aid in starting life was in paying for an education. Here, as in all Mr. Childs' charities, he looked for a task, small, relative to his means, distinct, complete in itself and unencumbered by future responsibilities. In all, he educated about 400 girls and as many boys. His usual method was to promise for a term of years a fixed sum paid semi-annually, and generally, though by no means always, not large enough to relieve parents and friends from the necessity for some exertion. His uniform selection was a technical education. He doubtless helped pay for some college education. What successful American has not contributed directly or indirectly to the promotion of the higher learning? But Mr. Childs turned his aid in education into the wage-earning channel. He insisted on it for boys. He sought it for girls. He expected an education to end early and bread-winning to begin promptly. The bent and direc-

tion of his charities was strictly utilitarian. He doubtless educated many who would have received an education without him, but Mr. Childs was perpetually using his means to bridge the gap between a comfortable life and sad stress for those accustomed to the former and suffering the latter. Mr. Childs'

SHAKESPEARE FOUNTAIN, STRATFORD-ON-AVON.

policy was so clearly known that for ten years past one could fairly say that any boy or girl of real promise in Philadelphia lacking means and with parentage which, in Mr. Childs' opinion, gave a claim was pretty sure of a few years of education among the 18 or 20 whom Mr. Childs had constantly on his long list of boys and girls educating. His aggregate expenditure under this head was of late years \$6,000 to \$8,000 annually. In earlier years it exceeded this figure.

To the direct and personal aid to authors and printers Mr. Childs added a desire to perpetuate literary memories. He was a man of monuments in all forms. The most important one he erected over thirty years ago by publishing Dr. Allibone's "Critical Dictionary of English Literature and British and American Authors." There was no profit in this vast compilation. There could be none. It was a heavy loss instead, and this loss was as clear before a page was

set as after the publication of the last two volumes was turned over to Mr. Childs' business successors. Mr. Childs embarked in it as a service to letters, and it was, on the whole, a most valuable contribution he made. "Allibone" has its faults. They are in-

phia Mr. Childs put in a noble fire place, the only guild hearth stone in our raw new land. His rector, Dr. Morton, of local note, is commemorated in a great window in his parish church. A group of neglected officers' graves caught his eye at the United States Military Academy at West Point, and he put on each its monument. The hall there was without portraits of Grant, Sherman and Sheridan. Mr. Childs provided them. There is a drinking fountain in Philadelphia. There is a monument over Richard Proctor's grave at Greenwood. There are tablets to Leigh Hunt and Poe.

These public gifts were supplemented by a perpetual stream of personal benefaction. Precisely as his charity was most felt by those in his business, his benevolence was most lavished on those in his daily life. There never was a man, certainly no man ever heard of, whose wedding presents so extended to the remotest verge of his acquaintance. His wedding clocks must stand on hundreds of mantelpieces. When giving watches was his fancy, it was an horological peril for any one not already ostentatiously watched to do him the remotest service or attract his kindly notice. But these were trifles—his dissipation and diversion in the serious business of giving. He was forever turning troubled lives into happier channels. One charming story, even in outline, is of young love, estranged parents and poverty, with Mr.

COWPER AND HERBERT WINDOW, WESTMINSTER.

numerable. No one can use it in careful work without checking date and reference in a work whose titles were often clipped from sales catalogues. None the less it has saved hours and days of labor to every literary worker. Thus associated with the great stream of English literature, Mr. Childs commemorated its greatest figure in a fountain at Stratford, to which England contributed a protest from the lord of the manor as to his rights in the site. In St. Margaret's Mr. Childs placed a window to Milton. A window to Cowper and Herbert stands in Westminster Abbey which he contributed. Another to Thomas Moore is in Broham Church. His gift in the church where Raleigh is buried was aptly matched by the cross erected at the Golden Gate where Drake landed to celebrate the first English service in the New World. But these conspicuous monuments were only a part of his life work. When the College of Physicians built its hall in Philadel-

JOHN MILTON MEMORIAL WINDOW, ST. MARGARET'S CHURCH, WESTMINSTER.

Childs appearing, first, with a trousseau, then with a furnished house, next with the money for a neat business, and at last providence, prosperity and babies having justified his reckless encouragement of love and elopement, reconciliation and the paternal blessing. A trousseau, a wedding trip, a winter or a summer outing for an invalid, these were always pouring from that capacious check book. When the World's Fair came, seventy or eighty saw it at his expense, and when he saw it himself in all its glory, he was conscience smitten that he had not doubled the number. The Irish woman who said in a street car

after his death to a stranger that she did not see what poor people were going to do when anything happened, now that Mr. Childs was gone, expressed a general conviction, based in her own case on a bricklaying husband, a weak scaffolding, a fall, three months' illness and Mr. Childs.

The principle on which he acted in this long life of giving has doubtless grown plain to the reader in this recital. He left no monument. He did no one great thing to live after him. He preferred the daily pleasure of creating happiness. He was all his life seeking out those whom adverse fortune had deprived of comfort and providing it. When a man of equal improvidence and ability died the other day, without a penny for his family, it was found that Mr. Childs had been for some years carrying a policy of \$20,000 on him. In all the relations of his life, he used abundant means to make life's lot easier. He doubtless loved the praise of his good deeds, but as Archbishop Ryan, a Roman Catholic prelate, finely said of this good Protestant, "he did not do his good deeds for the sake of praise." Hosts of them were in secret and his love of praise was as simple and innocent as a child's. We are all familiar with the man of gifts, preacher, speaker, writer, scientist, who is "too busy to make money," and pours his energy into the channel of some great cause or study. Here was a man with the money-making gift, who dedicated it in precisely similar fashion. He owned his powers. He was not owned by them. Those of whom this is true steadily multiply in all walks. Such lives are no sacrifice. Selfishness is the only real sacrifice and loss. The lives which give have all the joy and rapture this world holds—each after his reward.

DELEGATES AT LARGE TO THE NEW YORK STATE CONSTITUTIONAL
 CONVENTION.

A NEW CONSTITUTION FOR NEW YORK.

THE REPORT OF AN INTERVIEW WITH A DELEGATE TO THE FORTHCOMING CONVENTION.

ACCORDING to the Constitution of the State of New York which is now in force, and which was adopted in 1846, this question is submitted to the people every twenty years: "Shall there be a Convention to amend and revise the Constitution?"

The first occasion when this question was voted upon was in 1866, when it was answered in the affirmative by a large majority. Accordingly a Convention was chosen which submitted a proposed new Constitution to the people at the election of 1869. That being the year following a presidential election, party feeling ran high; and, the Republicans having had a majority in the State Convention, the Constitution which was submitted was considered by the Democrats to be favorable in some respects to the Republicans, especially in the matter of apportionment, and also in some of the provisions regarding local government.

The Democrats, therefore, generally opposed its adoption, and this course was made easier for them by the fact that the Convention resolved to submit the judiciary article separately. It was thus possible to adopt very needful reforms in the judiciary without accepting the entire Constitution. It has always been charged that the vote of 1869 in this State was fraudulent. But the result, at all events, was that the Constitution was rejected, with the exception of the judiciary article.

Since that time there have been a number of amendments adopted, some of very great importance and embodying many of the reforms proposed by the Convention of 1867. For instance, the old Boards of State Prison Inspectors and of Canal Commissioners were abolished, and provision was made for one Superintendent of Works and one Superintendent of State Prisons. Later on, the tolls upon all the State canals were abolished by Constitutional amendment, and on several occasions provision was made for additional judges of the Supreme Court in districts where this seemed particularly necessary. Another very important amendment which was adopted in 1874 was the one containing restrictions upon the legislature in the passage of private or local bills, and also enabling the Governor to veto single items in the appropriation bills.

REVISION ORDERED EIGHT YEARS AGO.

In 1886 the question, "Shall there be a Convention to amend and revise the Constitution" was again submitted to the people, and was answered in the affirmative by a majority of over 300,000. The Governor being Democratic, however, and the legislature Republican it proved impossible for six years to pass a

law providing for the actual election of delegates to the proposed Constitutional Convention.

Finally the law of 1893 was passed, and amended at the same session, providing for a Convention of one hundred and seventy-five members, fifteen to be elected by the State at large and five from each of the thirty-two Senatorial districts. Delegates to this Convention were chosen at the election last November, with the result that the fifteen delegates at large, and also ninety-three district delegates, were elected by the Republicans, and sixty-seven district delegates by the Democrats, giving the Republicans a majority of forty-one. At the head of the Republican State ticket for delegates at large was the name of Joseph H. Choate, who is, in all probability, to be chosen as president of the Convention without opposition.

The Convention will meet on May 8, 1894, in the Assembly Chamber of the Capitol at Albany, and the pay of its members is limited to ten dollars a day up to September 15. It will, therefore, clearly be necessary for the Convention to sit during the entire summer.

An effort will doubtless be made to adjourn to Saratoga; and while there seems to be no legal objection to this course as the law now stands, a bill has been introduced in the legislature expressly permitting the removal.

A DELEGATE INTERVIEWED.

In view of the importance of this approaching Convention, the editor of the REVIEW OF REVIEWS has sought an interview with one of the delegates whom he regards as especially well-informed. The Delegate's replies to queries were substantially as follows:

"There can be no doubt that this Convention will have one of the greatest opportunities conceivable to give this State a better general and municipal government. While of course partisan motives should be laid aside in determining questions of constitutional law, it will nevertheless be impossible for the Republican majority in the Convention to divest themselves of their responsibility. If they use their vast power temperately and patriotically, and submit to the people a Constitution meriting the approval of all conservative men, the Republican party will be entitled to the credit and will receive it. Any attempt, moreover, on the other hand, to make partisan capital out of this temporary power will surely react unfavorably upon the party of the majority. The number of partisan questions which will arise is fortunately not large. The question of enlarging the legislature and the apportionment of Senators and Assemblymen is, perhaps, the only one inseparable from party politics.

"The State of New York, with its six million inhabitants, is, unfortunately, almost equally divided into a city State and a rural State, each of three million inhabitants,—the dividing line between them running just north of the city of Yonkers from the Hudson river to the Connecticut line. The city State is overwhelmingly Democratic, the rural State overwhelmingly Republican. The difficulty about giving to both divisions of the State an equal number of representatives arises from the fact that the old historical county lines, which it would be folly to disturb, divide the State very unequally, and accordingly it is only too probable that the rural districts will continue to have, as is now the case, an advantage over the cities in the number of representatives in the legislature. This question may give rise to some partisan feeling, but I have hopes that it can be adjusted with fairness to all interests, and the new Ohio amendment, putting future changes of the apportionment into the hands of a non-partisan commission, certainly deserves serious consideration from our New York Constitution makers."

RADICAL CHANGES DISCOURAGED.

"Will there, in your opinion, be any very radical changes in the fundamental provisions of the Constitution?"

"In my opinion there will not be any such radical changes. The example of the rejected Constitution of 1867 must have a steadying influence upon this Convention. Moreover, the time to which the sessions of the Convention is limited is so short, and the number of crying abuses in Municipal Government, in the Judiciary, and in various other branches of the State Government is so great, that it will be necessary, I should suppose, for the Convention at the very outset to declare against the possibility of radical innovations. For example, the adoption of woman suffrage in any form, or even the submission of such an article as a separate proposition, would in my opinion make further discussion of the Constitution useless. The great conservative forces of the State, such as the German vote, the overwhelming majority of the churches, Protestant as well as Catholic, and great elements of the urban vote, would unhesitatingly reject the entire work of a Convention committed to such a fundamental change. Any too radical idea, no matter how meritorious in itself, would always expose the Constitution to the danger of rejection, for the reason that it would be used by partisans,—who in fact objected to the Constitution on different grounds which they would hesitate to avow,—as a cloak or pretense for their opposition. I state this view, of course, without reference to my own predilections; but it will be readily seen that the number of amendments and readjustments of authority which must necessarily be made by this Convention is so large, that it can be by no means unfair to the advocates of radical innovations if they are left to submit their ideas in the future, separately, in the form of amendments, when there is no chance that adoption or rejection will jeopardize

reforms avowedly within the domain of constitutional law."

"PROPORTIONAL REPRESENTATION."

"Do you include the idea of proportional representation among such questionable innovations?"

"I do not; and this is my reason: While it may be impracticable to adopt proportional representation to any degree or in any form in the election of State officers, I think that my caveat against radical innovations need not be held to apply to the reform of municipal government; and to my mind, at least, there is no fairer and better method of electing a municipal legislature, and none which should commend itself more strongly to the good sense of the people, than one which introduces some plan of proportional representation."

"Do you understand that there are members of the Convention who have given sufficient attention to this question of proportional representation in cities to be prepared to propose a definite project, or will the Convention probably be open to suggestions upon that subject?"

"The Convention must necessarily rely in all such matters upon the best thought of outsiders and specialists who have given the subject much more attention than any member of the Convention possibly could, and who can apply themselves to the formulating of the exact amendments that are wanted much better than members, whose services on different committees will prevent such complete concentration. The Convention would doubtless, therefore, welcome all concise and summary suggestions from the disinterested friends of good government, especially if such suggestions will take the form of proposed amendments."

TO PROVIDE FOR THE "GREATER NEW YORK."

"One of the most important problems to work out will undoubtedly be the creation of the so-called 'Greater New York,'—in other words, the welding into one municipality of nearly all of the city half of the State, to which I have just been referring. By a curious oversight, of which, however, legislatures are not infrequently guilty, the question of consolidation with New York is to be submitted to the people of the proposed Greater New York on the very same day next November when the new Constitution must be voted upon. Ordinarily, this might deter a Convention from dealing with the question in the Constitution until the result of that vote were known."

"But, perhaps, the greatest abuse which the Constitutional Convention is called upon to remedy this year is the judiciary system of the State, and the denial of justice involved in the ridiculously small number of Justices, and in the laxity of rules regarding vacations. These abuses cannot be remedied without the creation of new judicial districts; and it will be readily seen that the making of a new judicial district, to be composed of the cities of New York, Brooklyn and Long Island City, would be impossible if they were to remain under separate governments. Moreover, it is proposed to obliterate the two coun-

ties of Kings and Richmond (Staten Island) by taking them into the new three-million city; and other changes of such a fundamental nature are involved that they can only be properly made by the Constitution itself. It is, therefore, quite probable that the Convention will ignore the separate vote upon consolidation, or rather presume upon a favorable vote, and will go right ahead erecting a great municipality composed of New York, Brooklyn, Long Island City, Staten Island and parts of Queens and Westchester Counties; and that it will go further and lay the foundations of a reformed municipal government for this vast city, broad and deep.

SEPARATE ELECTIONS.

"It is impossible in a brief interview to even enumerate the most important details of the administration of this new great city. But one improvement which I hope to see adopted, and which will apply also to all other cities, as well as local divisions of the State, is the absolute separation of their elections from those for national and State officers. The method which has thus far been discussed with the greatest seeming approval of experts on the subject, is one providing that all local officers of cities, counties and towns should be elected at the November election in every odd year and should all hold office for the uniform term of two years.

"On the other hand, State officers should be elected in the even years between presidential elections, Senators being elected at the same time for four years, and Assemblymen to hold office for two years. This is without reference to the much debated idea of biennial sessions, and the elections would be as follows: In 1896, President (National) and State Assembly; in 1897, Mayors, City Comptrollers, Sheriffs, District Attorneys, Supervisors and City Councillors; in 1898, Governor and other State Officers, Senate and Assembly; in 1899, Mayors and other local officers again, as above.

VARIOUS CITY REFORMS.

"When the question of the powers of municipalities is considered, the modern and approved plan of allowing greatly increased latitude to cities in respect to their own public works must undoubtedly be entertained by the Convention. The Wilson plan for rapid transit in New York is only typical of similar plans which will no doubt arise within the next twenty years and for which provision should perhaps be made. Moreover, it is a question whether the civil service or the city should not be taken out of the hands of organizations like Tammany Hall by a provision absolutely prohibiting the payment of a salary to any subordinate city official not appointed in accordance with the civil service rules; and whether the influence of certain dangerous elements in our cities would not be materially lessened by a provision prohibiting any one having an interest in a license of any kind from being a city officer. This latter idea might very well be defended on the ground that any one holding the business relations with the municipality implied by a license should not himself have

any office of the corporation granting it to him and subjecting him to restrictions. The concentration of power in a thoroughly representative City Council elected by proportional representation, receiving no salary, of which the Mayor and all heads of departments should be *ex-officio* members, is another idea worthy of serious thought by the delegates as well as by their advisers. To such a Council would necessarily be given absolute and plenary power over everything that might be called budgetary in the city administration, the voting of all supplies and the absolute legislative control over all city officers; and the power of the State legislature to interfere with home rule in cities would in such case probably be limited very strictly."

UNIFORM CHARTERS AND CITY HOME RULE.

The Delegate was here interrupted by his interrogator as follows:

"You have spoken at some length with regard to the structure and administration of the proposed Greater New York. Now what have you to say upon the question of home rule for the other cities of the State, and upon the general question of legislative interference with municipal matters, whether in Buffalo, or Rochester, or Elmira, or elsewhere? I understand that in most of the Western States the Constitution requires the legislature to arrange for a classification of cities into several groups according to their population, and makes it mandatory that the legislature shall provide a general law suitable for the organization and administration of these cities so that all separate charters are denied, and all special acts which could affect the charter of one city without affecting the charters of every other city of the same class are impossible. Do you consider that such a thing would be feasible in New York?"

"Personally, I can see no reason why it should not be, and the idea certainly deserves study and elaborate investigation by the Convention. The idea of separate elections will necessarily of itself involve a great uniformity in some respects, and there would seem to be no reason why this uniformity should not be extended to other matters as well."

THE STATE GOVERNMENT.

"What about the future organization of the State government, both executive and legislative?"

"Many delegates will be of the opinion that experience has shown the number of elective State officers could very properly be reduced to three—namely, the Governor, Lieutenant-Governor, and Comptroller. There would seem to be some valid reason why the Comptroller, as a check upon all expenditure, should be a check even on the Governor; but the State Treasurer at present is nothing but a clerk of the Governor. And there seems to be some hardship in requiring a Governor belonging to one party to accept the advice of an Attorney-General who is his political opponent. The Secretary of State's functions are almost wholly clerical. The legislature is now no larger than it was made by the Constitution of

1821, when the population of the State was less than one-third of the present number; and the State of New York now in fact has more inhabitants than the United States had in the first years of this century. To put it in the power of seventeen men out of the total thirty-two in the Senate to make or obstruct a law, would seem to set a premium upon forbidden influences. Moreover, the example of other States with larger legislative bodies has been wholly favorable, and I would not be surprised if a proposition to enlarge our senate from three hundred to three hundred and fifty and our assembly to three hundred and seventy-five or three hundred and eighty would have many friends in the Convention.

"Experience has not shown that any of the present prohibitions upon the legislature have worked a hardship, and the list may possibly be prolonged. The question of biennial sessions will undoubtedly come up for discussion, as will also that of a reduction in the salaries of members and possibly the introduction of the European idea of free transportation upon all railroads in the State, for members of the legislature and a specified number of officers. This latter idea is defended upon the ground that in practice it now exists, but has the unpleasant feature of a feeling of obligation to the railroad company on the part of the individual member, and, furthermore, that it is in the interest of the State that its officers and legislators should be fully conversant with the character and needs of different sections. It is likely also that the idea of a Council of Revision to keep out unconstitutional legislation may be broached."

TO MEND THE LAW'S DELAY.

"What is the main end to be gained, and what would be the method, of such a reform in the judiciary as you consider needful?"

"To sum it up in a word, it is the law's delay that condemns the present system. In the City of New York to-day, it takes about three years for an ordinary civil suit to be reached for trial in the Supreme Court. This is equivalent to a denial of justice in the majority of cases, especially in cases where wealthy men or corporations are the defendants and where the plaintiff is poor and perhaps dependent in many ways upon a speedy adjudication of his claim. The business of the Court of Appeals in Albany is crowded only to a less degree, and the same is true of most of the other courts of the State. An impartial observer, especially one unfettered by the professional prejudices of the bar, would be very likely to say that there is no good reason why a legal controversy could not be submitted to a proper tribunal inside of three months from the time that it arises, and why, if the decision fails to satisfy the defeated party, an appeal to the general term of the Supreme Court should not be had within another month, and a final adjudication upon the matter by the highest court of the State within three months more. These would seem ludicrously extreme ideas to any one who has had long experience with the present calendars of our courts, but it is just possible that the Convention may try to

realize such a utopian condition. That there must be a large increase in the number of judges, a consolidation of some of the lower and intermediate courts, and a limitation upon adjournments and vacations, would seem to be clear, and the great number of eminent and experienced lawyers in the Convention is a guarantee that whatever is done to remedy the present state of affairs will be done in a conservative spirit."

EDUCATIONAL REFORMS.

Here the Delegate was invited to express himself upon school questions by the following remark and question:

"There is no public matter that lies in reality so close to the hearthstone of every family in New York as that of the proper provision for education, so that a wise and practical intelligence for citizenship and for self-support may be brought within the reach of the children of every household. What can this Convention do to improve the school system of New York and for education in general?"

"The opportunity is given to this Convention to place the entire educational system of the State, from the primary school to its colleges and universities, under a thoroughly competent and representative State authority, and to prohibit interference by the legislature or by local officers in the sphere particularly reserved to the science of education. The Board of Regents of the University of the State of New York is a body which, although its powers have been enlarged within two years, has never yet had that opportunity of doing effective work which so representative and important a body of men should have. And uniformity in the local boards of education would also seem desirable. There certainly can be no reason why in a city like New York there should be a Board of Education appointed by the Mayor, and various local boards of trustees and inspectors as well, while in the city of Buffalo all educational matters are summarily disposed of by a committee of the board of aldermen.

"To the central State authority should be accorded general supervision. And on the other hand, the local regulation, especially of the common schools, should be interfered with as little as possible. The connection which the Board of Regents now represents between the State at large and higher secondary institutions,—academies, high schools, seminaries, etc.,—is very valuable and should be preserved or strengthened. Moreover, the introduction of a far-sighted system of forest reservations by the State will require a school of forestry for which private enterprise would be inadequate: and the agricultural experiment stations now established and other institutions for State purposes now maintained at Cornell University and elsewhere, point toward greater efforts in the same direction."

THE DENOMINATIONAL SCHOOL QUESTION.

"There seems to be considerable discussion current in the newspapers regarding an alleged attempt to be made to induce this Convention to sanction appro-

priations of public money for denominational schools and charitable institutions. Is the Convention likely to meet this question, and in what way?"

"From general observation, and conversation with people from all parts of the State, I should say in reply that the Convention will most certainly fail to meet the expectations of a vast majority of the best people of New York if the new Constitution does not prohibit absolutely all appropriations of public money under any pretense for any institution wholly or partly under control of any denomination, or in fact any institution not wholly under public authority."

FOR HONEST AND PURE GOVERNMENT.

"What may we hope that this Convention can feasibly do to promote certain reforms which lie in the direction of a purer and a better administered public service? I mean, for instance, such reforms as those which will safeguard the ballot box, and those which may be included under the term of reform of the civil service."

"The Convention would signally fail to meet the best expectation if it did not provide most emphatically for civil service reform, and for real ballot reform, including the legalizing of mechanical devices such as the Myers voting machine, and the imposition, if necessary, of a penalty upon those voters who neglect their public duty. It seems to be apparent

that this latter reform lies at the bottom of many of the others; for the most perfect system of voting is of no account if the best classes of voters stay away from the polls through indifference."

AN UNRESTRICTED FRANCHISE.

"I have observed a recent tendency in the New England States, in the Southern States, and in some of the new far Western States, to place some small educational restrictions upon the exercise of the elective franchise. Is any proposition of this kind likely to be seriously discussed in the New York Convention?"

"I fear that in view of the character of the population, especially of the city half of the State, any such proposition would involve the rejection of the entire Constitution, and hence be open to the objection stated before against all very radical innovations. There is little reason to think that the Convention will attempt either to widen or to narrow the existing basis of the electoral franchise."

While, then, the new Constitution is not likely to go before the people freighted with any heavy cargo of so-called new ideas or utopian remedies for alleged social ills, it can be made the instrument of a number of genuine and desirable reforms; and it will behoove thoughtful citizens to give their minds and influence to the task of advising and stimulating the Convention for the attainment of the best possible results.

EMERGENCY RELIEF AT WASHINGTON.

The means employed at the Federal Capital to relieve the season's distress will naturally interest the entire country. Col. John Tracey, the U. S. Superintendent of Charities for the District of Columbia, has kindly prepared for us the following valuable statement:

The Federal Capital is peculiarly placed with regard to the conditions of distress that exist in all large cities of the country. Not being a manufacturing center, the number of unemployed artisans and laborers is relatively less than in other municipalities of importance. Nevertheless, the entire suspension of building industries has thrown a large number of men out of work, not only masons, carpenters and plasterers, and other mechanics, but the employees of brick-yards and other establishments in which building materials are prepared. The suspension of these industries has left out of work about twenty-five hundred men who usually earn wages at this season of the year. There is considerable suffering among the people engaged in what the French call "the small industries." The financial panic has deprived these people of their ordinary custom, and there are many hundred homes in Washington in which there now exists real want of the necessities of life among people who are very reluctant to make their sufferings known, and who, through pride, bear their privations in silence as long as they can.

There is also, as is customary in winter, an influx of needy people, particularly colored persons, from the District of Columbia outside Washington, and from nearby localities in Virginia and Maryland. This temporary migration has been larger than last year, but is now daily increasing. Altogether, with a resident population approxi-

imating closely to 300,000, there may be estimated to be now in Washington about fifteen thousand persons who are legitimate subjects of public aid, exclusive of those who are regular inmates of charitable and reformatory institutions.

The institutions of Washington care for a large number of persons, both permanent inmates and transient subjects of relief. It is a singular feature of the situation that some establishments of the latter class have not been crowded. Such is the case with the Temporary Home for Ex-Union Soldiers and Sailors, where applicants for pensions usually resort, and also with the Municipal Lodging House, where those seeking relief are required to do a certain amount of work for each night's lodging and each meal furnished. The Central Union Mission, a general institution of aid and shelter for the indigent, reports its applications this winter larger than at any time during the past nine years; as is also the case with the Young Women's Christian Home, which does similar charitable work exclusively for females. On the other hand, the police authorities and Society of St. Vincent de Paul, the Associated Charities and other organizations which distribute food, clothing and fuel to persons at their homes, report the demand for relief as large beyond precedent, and many cases of extreme destitution in quarters where it has not heretofore existed. The Washington Asylum, which unites the offices of almshouse and hospital for

the destitute, is very crowded, and arrangements for increasing accommodations there became necessary.

Specific measures for emergency relief were adopted by the organization of the Central Relief Committee of citizens, upon the plan outlined by the public meeting held on December 19. That meeting was called by the Commissioners of the District of Columbia in response to a public demand, expressed through the newspapers and many communications. It resulted in two lines of relief effort—one to obtain work for the unemployed, and the other to give systematic succor to those needy and deserving. A committee was appointed to ask Congress to render immediately available the contemplated appropriation of \$53,000 for construction and repair of District roadways. This application, favored by the House Committee on Appropriations, failed temporarily through a single objection in the House, and was thrown over until after the tariff debate. It is still expected that the bill will pass in time to insure the beginning of the work early in the spring instead of after July 1.

A system of relief to the worthy was provided in accordance with a resolution of the same meeting, by the appointment of a Central Relief Committee of fifteen, designated by the Commissioners of the District. This committee immediately organized and adopted as relief agencies the Police Department, the Associated Charities, the United Hebrew Charities, the Society of St. Vincent de Paul, the Central Union Mission, the Young Men's Christian Association (colored) and the Deaconess' Home. A Committee on Distribution was appointed, and a central depot for the receipt and distribution of supplies was opened on the premises of the Central Union Mission, in the Old Post Office Building, a very accessible and suitable location. A Committee of Fifty citizens was appointed by the Chairman of the Central Relief Committee, and charged with the work of soliciting contributions in money and in provisions, in accordance with a system reported by Mr. Theodore W. Noyes, as Chairman of the Sub-Committee on Ways and Means. This Canvassing Committee divided the District of Columbia into thirty-eight districts, with neighborhood sub-committees in each. These executive sub-committees were furnished with blanks, which were left at every house and called for by the canvassers. The blanks have spaces for donations in money, in fuel, and in provisions, and also for notes of cases of distress coming under the observation of the neighborhood canvassers. These memoranda are daily transmitted to the Central Relief Committee, and the contributions of supplies are collected by the committee, while those of money are sent through the Treasurer of the Canvassing Committee to the Treasurer of the Central Relief Organization. In this way, a very thorough knowledge of wants, as well as resources, is acquired, and imposture is rendered difficult.

Various minor expedients have been resorted to as parts of the system, rapidly devised to deal with an emergency. Among them was the issuing of meal tickets, at ten cents each, of which ten thousand have been used up to date, distributed by citizens instead of alms in money. Unavailable for other use than a good meal, these tickets have diminished the nuisance of professional alms seeking.

Of donations in supplies, there have been distributed during the month of January one hundred large van loads, consisting of meat, vegetables, groceries, bread, meal and clothing of all sorts. Fuel orders have also been given against donations by dealers to the extent of one hundred tons of coal and an equivalent quantity of wood. In addition to large deliveries through the nine police stations of the District of Columbia, the district offices of

the Associated Charities and the minor central agencies, there have been sent for cases specially investigated by the Central Committee a very large number of smaller packages. Transportation was provided free by the police patrol wagons, by the delivery vans of the leading merchants and by the local express companies, so that the entire expense of this branch of the work, including the keeping of records, has been the pay of a clerk in charge and two helpers.

The value of donations of supplies received and distributed exceeds ten thousand dollars. The money collections first available for the committee consisted of an original fund of ten thousand dollars, which included four thousand dollars raised by a concert given by the Marine Band, subscriptions at the citizens' meeting, the Washington Post Fund and an unexpended balance of a similar fund of the *Evening Star*. The Canvassing Committee has turned in twelve thousand dollars. The total value of the collection since Christmas up to the date of writing exceeds thirty-two thousand dollars and it is safe to say that contributions in money and in kind will aggregate forty thousand dollars. As there is a balance of over five thousand dollars yet available, it is believed that no further appeal will be necessary, especially if the employment appropriation bill be passed.

The police of Washington have a very good system of investigating distress, affording quick relief and accounting for donations, under the direction of Major Moore, the superintendent, and Mr. Richard Sylvester, the Chief Clerk and Property Clerk of the Department. The Associated Charities and other distributing agencies have exercised similar precaution, and as all names of beneficiaries have been collected and each case has been kept in the hands of a single agency, duplication of charity has been rare, while the city has suffered much less than was anticipated from the nuisance of unworthy seekers for relief. During the month of January the relief orders given were: Through the police, 4,364; through the Associated Charities, 3,851; through other agencies, about 1,100. Grand total, 9,315 orders.

The nature of the main organization for emergency relief work can best be indicated by a list of the principal offices of the temporary relief associations, as follows, the chairmen of the Central and Canvassing Committees being ex-officio members of various sub-committees:

Citizens meeting, December 19, Rev. Byron Sunderland, Chairman; M. I. Weller, Secretary.

Central Relief Committee: John Tracey, Chairman; James W. Somerville, Secretary; Beriah Wilkins, Treasurer.

Committee on Distribution: Lawrence Gardner, Chairman; Miss Harriet B. Loring, John F. Cook, L. S. Emery.

Committee on Ways and Means: Theodore W. Noyes, Chairman; Simon Wolf, Beriah Wilkins.

Auditing Committee: B. H. Warner, Chairman; C. C. Cole, J. Harrison Johnson.

Committee on Plan of Permanent Relief Organization: Simon Wolf, Chairman; John G. Slater, Mrs. J. W. Babson, Dr. J. W. Ritchie.

Citizens' Canvassing Committee: George Truesdell, Chairman; H. P. Godwin, Secretary; John E. Herrell, Treas. Executive Committee: John Joy Edson, Mrs. H. B. F. Macfarland, Wm. H. Baum, J. Holdsworth Gordon.

It is just to say that the work done under the direction of the Central Relief Committee has by no means measured the practical benevolence of the District of Columbia during the season of acute distress, there being no cessation or diminution of usual charitable effort through parish societies and many fraternities.

THEODORE BILLROTH.

A SHORT CHARACTER SKETCH OF GERMANY'S FAMOUS SURGEON.

THE modern surgical amphitheatre of a great hospital is the arena where is fought the battle with death and disease, with pain, misfortune and deformity. An impressive spectacle it is; tier upon tier of benches rising sharply one above the other, a sea of intelligent faces watching eagerly or indifferently the busy scene below, the glistening instruments in their antiseptic baths, the jars, basins and sponges, the assistants going swiftly and silently about their preparations, and in the center of all, the moving spirit, the nineteenth century gladiator, bare-armed and white-aproned, the operator himself.

BILLROTH'S CLINIC.

Perhaps the most famous clinic in the world was the late Dr. Theodore Billroth's in the University of Vienna. To it came students from every civilized land to learn the methods and listen to the teachings of the great professor.

The discipline in his clinic was that of an army, the result, possibly, of his long military service. A martinet, of few words, cold in manner, though sympathetic and tender with his patients, he gave himself little concern as to details, exacting from every one of his ten assistants the perfect performance of the duties assigned to him, seldom troubling himself to bestow a word of praise, while a rebuke from him, usually couched in the words, "But, Doctor," came to be considered almost a disgrace. In operating he was cool and almost cold blooded, swift, alert and dexterous. His methods were often unique, so much so his name occurs in modern works on surgery continually, perfecting or improving some operation. His greatest fame was reached in 1881, when he performed for the first time successfully excision of the pyloric end of the stomach for cancer. This achievement made his reputation world-wide, and easily placed him in a commanding position as a bold and successful operator. He soon came to be considered the first surgeon in Europe, and his clinic became renowned for the number and character of the operations performed by him.

Billroth cared little for money getting, the utmost difficulty often being encountered in persuading him to take charge of a case which gave no promise of interest or importance. As a consultant he was in demand in every continental capital of Europe, from St. Petersburg to Rome, occasionally journeying as far as Western Asia or even Egypt to give the benefit of his vast knowledge and experience. Honors had as few temptations for him as pecuniary reward, though many were thrust upon him in the shape of decorations, Russian, Austrian, Turkish, German, Roumanian, and the Emperor Francis Joseph in rec-

ognition of his eminence made him a member of the Austrian legislature.

HIS PERSONALITY.

In personal appearance Billroth was a little above the medium height, with a broad, intellectual face half hidden by a thick, flowing beard, blue eyes, small but sharp and piercing, and shoulders bent from long

DR. BILLROTH.

years of study. He was not, strictly speaking, a great teacher. His sentences were terse, delivered without raising his voice, and interesting more from the subject matter contained in them than from any peculiar charm in their delivery. The respectful attention with which his lectures were received and the absolute silence which reigned while he was speaking, he commanded without an effort. His success lay chiefly with his more advanced students and with the doctors who were pursuing special courses under his guidance

rather than with the beginners. His generosity and open handedness, aside from the personal fascination of the man and the glamour of his name, increased his popularity among both his assistants and students. It is said that he was in the habit of aiding the needy students whose pinched faces attracted his attention by throwing profitable work in their way. It is at least certain that the assistants profited largely by his unwillingness to undertake a case with little promise of interest. "Oh, go to Dr. So-and-so," he would say when pressed to treat such a patient.

EARLY LIFE.

Christian Albert Theodor Billroth was born April 26, 1829, at Bergen on the island of Rügen. His father was a Lutheran minister, and from his earliest youth both parents' efforts were directed toward guiding his steps into a professional career. His own inclinations, perhaps, would have led him to enter upon a life devoted to music, for which he showed very early a passionate fondness, but the remote possibility of the stage was enough to excite the pastor's family to violent opposition, and in 1848 he began his studies at the University of Greifswald. From there he went first to Göttingen and afterward to Berlin, where he received his degree of M. D. in 1852, on a thesis describing a pulmonary affection resulting from section of the vagus nerve. He decided to complete and round out his education by visits to other centres, and accordingly we find him journeying to Vienna and Paris. Shortly after he returned to Berlin, and became the assistant of von Laugenbeck, the greatest German surgeon of his time.

Billroth began to fit himself for teaching, and in 1856 his labors were rewarded by the position of privat-docent in the university. Other opportunities presented themselves, notably at Zürich, where he was installed as full professor and chief of clinic. There he remained until 1867, since when he has occupied a similar position in the famous Vienna University. His life in the Austrian capital was not unbroken, for the outbreak of the Franco-Prussian war recalled him to the Fatherland to assume charge of the military hospitals on the Rhine, at Weissenburg and Nannheim. After the siege of Paris and the close of the struggle he lost no time in returning to his chair at Vienna, where he continued until his death. His health had not been good for eight or nine years past, since an alarming attack of pneumonia, and he went to Abbazia, a well-known Austrian winter resort, to recruit his failing powers, where he died suddenly and peacefully on February 6, of debility due to heart trouble.

IN HIS VIENNA HOME.

A wife and three daughters, of whom only the second is married, survive him. The eldest daughter was the favorite, their friends often remarking that the relation between them seemed more that of

brother and sister than parent and child. They kept open house, entertained lavishly and made their home a salon where all the musical celebrities of Vienna, notably Brahms, Henschel and Saint-Saëns, were accustomed to assemble. Billroth himself was an excellent pianist, though he seldom appeared as a performer. Still he was a charming host and an attentive listener and the concerts he gave attracted the best artists of the city. Brahms and the Doctor were fast friends, the composer often treating his friends to a first performance of his compositions in his house. This style of entertainment and the expensive mode of living prevented any appreciable saving, so that when his illness awoke Dr. Billroth to a realizing sense of the possibility of his own death and the financial straits in which his family would be left, he determined on retrenchment and moved immediately into a flat, giving up his home and extravagance in living. Although so famous and so widely consulted, his practice was not large, owing to the peculiarities we have mentioned, and it is unlikely the change was made in time to permit him to accumulate even a competency.

HIS ACHIEVEMENTS.

Dr. Billroth entered upon the practice of his profession at a time when antiseptic surgery was in its infancy, when or before Lister made his great discoveries, and throughout his whole life much of the brilliancy of his success has been due to his championship of its principles. His early work was, in fact, more of the surgical pathologist than of the active operator, as can easily be seen from his numerous writings on bacteriological and pathological subjects. He was a prolific author, writing with the absolute ease that comes of a thorough knowledge of one's subject and long practice. It is said that he never hesitated, never waited for a reference. They were at his finger's end. One of the more widely quoted of his papers was his treatise on "Wound Fever;" but the volume which called forth most discussion and not a little unfavorable criticism was entitled "Teaching and Learning in German Schools." The work was translated into five or six European tongues, read and commented upon everywhere. In it he takes it upon himself to lay severe strictures on the Jews, and it was these anti-Semitic utterances (entirely foreign to his life and friendships) which brought down upon him the storm of indignation.

It is well to have lived, if, in dying, one's name is left inscribed where the sons of men may read and be incited to more arduous and better work. Billroth's pluck and daring won him first place among the surgeons of modern Germany, some say of the world. His name will always be identified with the advance of surgical science, with the alleviation of human misery, and is one to be written with that of Sims and of Lister.

THE STORY OF THE WORLD'S PARLIAMENT OF RELIGIONS.

BY THE REV. F. HERBERT STEAD.

REV. JOHN HENRY BARROWS, D.D.,
Chairman of the General Committee.

THE Parliament of Religions marks a new era in the history of mankind. Since it has been held the various religious communities, whether Christian or non-Christian, can never take up again to each other quite their old attitude. Antagonism there will be still—conflict there may be—but the fierce hatred and deadly intolerance which once generally prevailed have received their death-stroke. The world can never forget that honored representatives of the

chief living faiths of humanity have met on the same platform, have conversed frankly of their differences, have avowed the elements of faith and morals they hold in common, have agreed on common ends, and, above all, have joined in acts of common worship. This thing was not done in a corner, but openly, in the sight of all the peoples, at the greatest international festival yet held, the whole world being previously apprised of the event. The scene that was witnessed in the Art Institute of Chicago has been photographed on the universal consciousness, and the longer the exposure to the reflective intelligence of man, the more indelible will its features become. There were not wanting elements of pageantry to touch the popular imagination. The opening ceremony was a brilliant spectacle of moving color. Cardinal Gibbons, robed in scarlet, occupied the centre; on either side of him were Orientals in garments of "gorgeous red" and yellow, of orange and white, or of pure white. The silken and many-hued magnificence of the Chinese and Japanese delegates excited special admiration. Not less noteworthy in their way were the sombre costume of the Hindu monk and the imposing vestments of the Greek Archbishop, while around and before them stood thousands of men and women in varied garb from almost every nation under heaven. Nor was there lack of dramatic incident to deepen the impression. The one hundred and fifty thousand people who filled the halls during the seventeen days of session were unusually demonstrative in their enthusiasm. The delegates of the most

diverse faiths marched to the platform arm in arm. The Greek Archbishop publicly saluted the Catholic Bishop Keane with "an apostolic kiss" on the cheek. Archbishop Ireland (crowded out of the principal hall) found himself presiding over a Jewish congress in an adjoining room. No sooner had the Japanese Kinza Hirai finished his wildly-applauded denunciation of the iniquities of Christian nations, than Jenkin Lloyd Jones, in the fervor of the moment, flung his arm

around him. Solemnest and most deeply significant was the fact that each day the assembly opened in united silent supplication, which ended in the common utterance of the Lord's Prayer. This divine prayer has been spoken of as a symbol of Christian

MOST REV. JOHN IRELAND,
Archbishop of St. Paul.

unity. It must now be held to betoken a unity far wider than Christian. It was not merely joined in by men of other faiths; its utterance was begun and led, on one occasion, by Rabbi Dr. Hirsch, and on another by Mr. Mozoomdar, of the Brahmo-Somaj.

A NEW PENTECOST.

The spirit of the gatherings was thoroughly in accord with its devotional expression. It was throughout religious, reverent, fraternal. It was also intense and profound. It reminded some who were present of the spirit of the great revival meetings led by a Finney or a Moody. It has been described as "a holy intoxication." Again and again it has been called Pentecostal. The effect produced by the Hallelujah Chorus as sung at the closing session seems to have almost reached the point of ecstasy. "To the Christians present—and all seemed imbued with the Christian spirit—it appeared as if the kingdom of God was descending visibly before their eyes." Such are testimonies offered by men of the most different creeds. The late Matthew Arnold told us in italics that "miracles do not happen;" but if by miracle we mean such a convergence and combination of occurrences as is only explicable through the action of a Higher Will, then surely—to any one who accepts the theistic interpretation of history, and pre-eminently of religion—here was a miracle. President Bonney has dared to say, "It pleased God to give me the idea," and to close the meetings with the strong

words, "What men deemed impossible, God has finally wrought."

THE BOOK OF THE ACTS OF THE PARLIAMENT.

Of this great deed the story of the World's Parliament of Religions, which has just appeared in two volumes, edited by Rev. John Henry Barrows, D.D., chairman of the General Committee on Religious Congresses of the World's Congress Auxiliary, form a noble memorial. It not merely reports the proceedings. It communicates the spirit. It is the official record, but Dr. Barrows has combined with the fidelity of the official the fervor and vision of the spiritual leader. Much as it has owed to his secretary and other helpers, the book is alive with Dr. Barrows' religious enthusiasm, enriched and expanded as that has been by the wonderful experiences of the Parliament. Profound sympathy will be stirred by the sudden death of his first born just as he was completing the last chapter of the record. A glow as of an opened heaven falls on his closing editorial words.

These sixteen hundred pages are divided into five main parts. The first is a rapid and vivid "history of the Parliament," from its inception to its close. "The World's Response to a Great Idea," is the title of a chapter which is enough forever to banish the insane fancy that the Parliament was simply a Chicaogan project, to add one more rare show to the World's Fair.

GREETINGS FROM FAMOUS EUROPEANS.

Expressions of cordial approval of the idea of the Parliament are entered from Mr. Gladstone, Lord

PROFESSOR N. J. HOFMEYR,
Stellenbosch, South Africa.

Tennyson, Whittier, Chief Rabbi Adler, Phillips Brooks, Sir Edwin Arnold, the Bishops of Ripon and Worcester, Dr. James Martineau, General Booth, Mr. James Bryce, Rev. Hugh Price Hughes, Dr. Lunn, Dr. Fairbairn, President Miller of Madras, Dr. Hofmeyr (South African Reformed Dutch Church), Sir William Dawson, Professors Luthardt, Godet, Dr. Waldenström, and a great multitude of celebrities in all parts. The scientific worth of the enterprise may be inferred from the avowed sympathy of such professors of the comparative science of religion as Dr. Max Müller, who looks to the Parliament to "do excellent work for the resuscitation of pure and primitive Ante-Nicene Christianity;" of Dr. Tiele (Leiden), who contributes a paper on "The Study of Comparative Theology;" of Dr. Albert Réville, who concludes his paper by remarking "this Parliament marks the first step in the sacred path that shall one day bring man to the truly humanitarian and universal religion," and of Professors Pfleiderer and D'Alviella.

But though the book contains many weighty scientific essays, it is by no means an abstruse academic treatise. Except those entered in "the scientific section," the papers were all read or spoken before a

P. WALDENSTRÖM, D.D., PH.D., M.P.,
Stockholm.

from within, by intelligent but zealous votaries. One feels here the living heart-beat of devotion and sees the living face aglow with worship.

WHAT IDOL-WORSHIP MEANS.

The book contains many pictures of idols such as one mostly finds in missionary literature. There they are intended to excite the horror and pity of the Christian reader. Here the attitude to idolatrous religions is avowedly sympathetic rather than critical; but one can scarcely escape a twinge of the old feeling at a sight of the fantastic objects of worship. Nevertheless, the popular Protestant notion of idolatry was emphatically repudiated by those who spoke in the name of image-worshippers. Professor D'Vivedi, a Hindu from the Bombay Presidency, declared:

It may be said, without the least fear of contradiction, that no Indian idolater, as such, believes the piece of stone, metal, or wood before his eyes is his god in any sense of the word. He takes it as a symbol of the All-Pervading, and uses it as a convenient object for purposes of concentration, which being accomplished, he does not grudge to throw it away.

Similarly J. J. Modi, a Parsee of Bombay, refers to the grounds which "actuate and even justify a Parsee in offering reverence—which it must be remembered is something different from worship—to fire."

Suffice it to say (he observes) that the Parsees do not worship fire as God. They merely regard it as an emblem of refulgence, glory and light, as the most perfect symbol of God, and as the best and noblest representative of His divinity.

The Hindu monk, Swami Vivekananda, retorts upon Christian critics thus:

Why does a Christian go to church? why is the cross

DR. JAMES MARTINEAU.

crowded and demonstrative audience. The popular character thus insured is maintained and heightened in the general narrative of the proceedings.

In the following paragraphs a few glimpses are given of the kind of presentment made to the Parliament of the chief faiths of the world. It may be granted that our own scholars might at times give a more scientific account of the development of foreign faiths. But this consideration in no way affects the chief value of these contributions; which is that they represent the version of the world's religions, as given

BRONZE DABUTSU AT KAMAKURA.

holy? why is the face turned towards the sky in prayer? why are there so many images in the Catholic Church? why are there so many images in the minds of Protestants when they pray? My brethren, we can no more think about anything without a material image than it is possible for us to live without breathing.

HINDUISM BASED ON REVELATION.

This speaker, Swami Vivekananda, is a high-caste Brahman and representative of orthodox Hinduism. He was one of the principal personalities in the Parliament, as well as one of the most popular of guests in Chicago drawing-rooms. "Three religions," he begins, "stand now in the world, which have come down to us from times prehistoric: Hinduism, Zoroastrianism and Judaism." Of these, Hinduism alone has fully maintained its ground. "The Hindus have received their religion through their revelation, the Vedas." This is Vivekananda's account. With it picturesquely agrees the verdict of Rev. Maurice Phillips, missionary from India (p. 305):

We conclude that the knowledge of the divine functions and attributes possessed by the Vedic Aryans was neither the product of intuition nor experience, but a "survival," the result of a primitive revelation.

But by the Vedas the Hindu means no mere books:

The Vedas are without beginning and without end. . . . They mean the accumulated treasury of spiritual law discovered by different persons in different times.

The Vedas teach us that creation is without beginning or end. . . . The human soul is eternal and immortal, perfect and infinite.

"THOU ART OUR FATHER, THOU ART OUR MOTHER."

The Hindu refuses to call you sinners. Ye are the children of God, the sharers of immortal bliss, holy and perfect beings; ye are divinities on earth.

At the head of all these laws, in and through every particle of matter and force, stands One through whose

command the wind blows, the fire burns, the clouds rain, and death stalks upon the earth. And what is His nature?

He is everywhere the pure and formless One; the Almighty and the All-Merciful. "Thou art our Father, Thou art our Mother, Thou art our beloved Friend, Thou art the Source of all strength: give us strength. Thou art He that bearest the burdens of the universe: help me to bear the little burden of this life." Thus sang the Rishis of the Veda: and how to worship him—through love. "He is to be worshiped as the one beloved," "dearer than everything in this and the next life."

The Hindu religion does not consist . . . in believing, but in being and becoming. . . . Reaching God, seeing God, becoming perfect, even as the Father in Heaven is perfect, constitutes the religion of the Hindu. When a soul becomes perfect and absolute, it must become one with Brahma.

"NO POLYTHEISM IN INDIA."

Descending to "the religion of the ignorant," Mr. Vivekananda declared plumply on the very outset:

There is no polytheism in India. In every temple, if one stands by and listens, he will find the worshipers applying all the attributes of God, including omnipresence, to these images. To the Hindu, the whole world of religions is only a traveling, a coming up of different men and women, through various conditions and circumstances, to the same goal. . . . The Lord has declared to the Hindu in His incarnation as Krishna, "*I am in every religion, as the thread through a string of pearls*;" and wherever thou seest extraordinary holiness and extraor-

SWAMI VIVEKANANDA.

dinary power raising and purifying humanity, know ye that I am there.

This noble address concluded with a prayer beginning:

May He who is the Brahma of the Hindus, the Ahura Mazda of the Zoroastrians, the Buddha of the Buddhists, the Jehovah of the Jews, and the Father in Heaven of

the Christians, give strength to you to carry out your noble idea !

"THE BANE OF INDIA"—AND ITS ANTIDOTE.

Professor M. N. D'Vivedi, who also speaks as an exponent of Orthodox Hinduism, gives a copious narrative of the six great stages in the development of his religion from the time of the Rig Veda to the present day. From their lofty conception of God as "one only essence" "in the totality of all that is," he argues that the authors of the Vedas were much more than the simple, wondering, nature-worshipping shepherds that "the learned doctors" of the West try to make them out to be. It is deeply significant that this Orthodox Hindu professor, in narrating its beginnings, speaks of "the exclusive system of castes which has proved the bane of India's welfare." He traces the true reformation of Hinduism to the revival of Sanskrit consequent on the British advent in India. On the degradation of Hinduism prior to that period Mr. Nagarkar of the Brahmo-Somaj agrees with his orthodox countryman. He ascribes the British conquest of India to the direct intervention of "the Lord of love and mercy."

ESSENTIALS OF HINDU FAITH.

Professor D'Vivedi's Advaita philosophy teaches :

Look upon all as upon your own self. The philosophy of the absolute does not respect caste or creed, color or country, sex or society. It is the religion of pure and absolute love to all, from the tiniest ant to the biggest man.

As illustrative of Hindu tolerance of other faiths, he quotes the couplet of the *Bhagavata* : "Worship, in whatever form rendered, to whatever God, reaches the supreme, as rivers, rising from whatever source, all flow into the ocean." Professor D'Vivedi gives the following "principal attributes" of Hinduism : 1, Belief in the existence of a spiritual principle in Nature and in the principle of reincarnation ; 2, observance of complete tolerance and of the *Sams Karas* (twenty-five rites), being in one of the *Varnas* and *Asramas* (certain castes), and being bound by the Hindu law.

An eloquent account of the rise, progress and principles of the Brahmo-Somaj is given by Protap Chunder Mozoomdar, of Bombay. He utters a notable warning to the Christian nations :

I am often afraid, when I contemplate the condition of European and American society, where your activities are so manifold, your work so extensive that you are drowned in it, and you have little time to consider the great questions of regeneration, of personal sanctification, of trial and judgment and of acceptance before God. That is the question of all questions.

BUDDHA'S FOUR NOBLE TRUTHS.

Buddhism is represented by some dozen papers. As it exists in Siam it is concisely sketched by H. R. H. Prince Chandradat Chudhadharn. The Siamese form of the faith teaches that all things are made up from the Dharma or "essence of nature," itself formed of two essences, matter and spirit, both eternal, but

PROTAP CHUNDER MOZOOMDAR.

compounded, dissolved and recomposed in endless evolution. "The four noble truths as taught by our merciful and omniscient Lord Buddha" are : 1, "The very idea of self" involves suffering ; 2, suffering is caused by lust of sensuous or supersensuous objects ; 3, the cessation of this lust insures extinction of suffering ; 4, the paths that lead to the cessation of lust are eight—right understanding ; right resolutions ; right speech ; right acts ; right way of earning a livelihood ; right efforts ; right meditation ; right

H.R.H. PRINCE CHANDRADAT CHUDHADHARN,
Bangkok, Siam.

state of mind. These lead to "the absolute repose of Nirvana," which H. R. H. roundly defines as "the extinction of our being—nothingness."

BUDDHA'S SUPREME GOD.

A much more positive version of Buddhism is offered by H. Dharmapala, general secretary of the Maha-Bodhi Society of Ceylon, who is kind enough to append to his paper a list of works on the subject.

H. DHARMAPALA, COLOMBO,
General Secretary Maha-Bodhi Society.

"There is," he says, "no pessimism in the teachings of Buddha, for he strictly enjoins on his holy disciples not even to suggest to others that life is not worth living." Human brotherhood "forms the fundamental teaching of Buddha; universal love and sympathy with all mankind and with animal life. Every one is enjoined to love all beings, as a mother loves her only child."

Buddha only denies Deity in the sense of Creator.

A supreme God of the Brahmans and minor gods are accepted, but they are subject to the law of cause and effect. This supreme God is love, all merciful, all gentle, and looks upon all beings with equanimity.

From time to time a new Messiah or Buddha is promised. Nirvana is said to transcend all human thought: "it is eternal peace. On earth the purified perfected man enjoys Nirvana." "Eternal changefulness in evolution becomes eternal rest."

PARALLELS TO THE SERMON ON THE MOUNT.

Mr. Dharmapala claims that "wherever Buddhism has gone, the nations have imbibed its spirit and the people have become gentler and milder. The slaughter of animals and drunkenness ceased, and wars were almost abolished." He offers for comparison with passages in the Sermon on the Mount certain Buddhist teachings, of which these are the pearls:

Hatred does not cease by hatred at any time. Hatred ceases by love. This is an ancient law. . . . Let one overcome anger by love. Let him overcome evil by good. Let him overcome the greedy by liberality. Let the liar be overcome by truth. . . . The real treasure is that laid up through charity and piety, temperance and self-control; the treasure thus hid is secured and passes not away.

"THE SYNTHETIC RELIGION."

Japanese Buddhism presents a more metaphysical appearance. Of its sixteen sects and thirty sub-sects the Nichiren School is described by Yoshigiro Kawai as pre-eminent. The Mandala or object of this sect's worship is "the Buddha or original enlightenment," who "pervades all times and spaces, and is closely interwoven with all things and all phenomena. He is universal and all-present." The Rt. Rev. Zitzuzen Ashitsu tells of Buddha's three personalities, the first formless, eternal, omnipresent, immutable; the second, attained by his self-refinement; the third, which

A GROUP OF BURMESE PHOONGEES.

spontaneously appears to all kinds of beings to enlighten them. The only difference between us and him is our lack of self-culture. Other Japanese essayists glory in Buddhism as "the synthetic religion" and as the national spirit of Japan.

THE JAINS NO ATHEISTS.

Exposition of the religion of the Jains falls to Mr. V. A. Ghandhi, a fine-looking dweller in Bombay, honorary secretary of the Jain Association of India. Jains believe in the eternity of matter and soul, in "a subtle essence underlying all substances, conscious as well as unconscious, which becomes an eternal cause of all modifications, and is termed God," in the transmigration of the soul, and in Karman, or the strict recompense in succeeding lives of deeds done in the

Omi, Japan.

HON. PUNG KWANG YU, PEKING,
Delegated by the Emperor of China to present the doctrine
of Confucius.

present life. The charge of Atheism frequently brought against the Jains is thus repudiated.

CONFUCIAN ETHICS.

Confucianism is sketched at a great length by the Hon. Pung Kwang Yu, first secretary to the Chinese Legation at Washington, who was deputed by the Emperor of China to expound the official religion. His account of it and of its relations to other faiths, as well as his criticism of European missionaries, presented from the standpoint of the widely-traveled scholar and diplomatist, forms one of the most valuable features of the book. "Only a single person who is venerated as the teacher for all generations and in all human attainments," "only a single uncrowned lawgiver who has been venerated by sovereigns and ministers of all succeeding generations as their own teacher," is Confucius. "By bequeathing the 'Six Classics' to posterity, Confucius practically concentrated in himself the wisdom of the ancients." The five "natural relations" of man are those of "sovereign and subject, parent and child, husband and wife, elder and younger brothers, and friends." Confucius requires in each of these relations the appropriate behavior. "Do not unto others," said he, "whatsoever ye would not that others should do unto you." In comparison with this five-fold distinction, Mr. Pung feels the Christian resolution of all social relations into a universal brotherhood to be abstract and unjust. "A universal love of mankind, without distinction of persons, gives more to him to whom less is due, and less to him to whom more is due."

THE DANGER OF "IMMORTALITY PILLS."

Doctrines of immortality and everlasting life Confucians do not accept, but do not suppress. "We

cannot as yet," says Confucius, "perform our duties to men; how can we perform our duties to spirits?" Of Buddhists and Taoists, says Mr. Pung:

As a rule, they are men given to speculations on the invisible world of spirits, and neglectful of the duties and requirements of life. For this reason they are employed by public functionaries to officiate on occasions of public worship, and, at the same time, they are despised by the Confucianists as the dregs of the people.

Throughout Mr. Pung speaks of miracles, stories of another life, and concern to propitiate spirits, pretty much as the English man of science would have spoken a score years ago of spiritualism.

A prize essay, by Kung Hsien Ho, naively protests against belief in immortality. "If we become like genii, then we would live on without dying; how could the world hold so many? If we transmigrate, then so many would transmigrate from the human life and ghosts would be so numerous." He also objects that an emperor who believed in Taoism "got ill by eating immortality pills!"

ZOROASTER A MONOTHEIST.

The religion of the Parsees, or Zoroastrianism, is unfolded by J. J. Modi, of Bombay. He denies that Zoroaster preached dualism. Parseeism, he says, is a monotheism. Ahura-Mazda is the Omniscient Lord, the causer of all causes, the creator, the ruler of both the material and immaterial world, the source of all physical and all moral light. The two principles, evil and good, Angro-mainyush (Ahriman) and Spenta-mainyush, are both subordinate to Ahura-Mazda. Purity, physical and moral, is the law of human life. The sanitary code of the Parsees will, for the most part, "stand the test of sanitary science for ages together." On the triad of "thought, word, deed," the

whole morality is based. Three days after death the soul of a man is judged at the Chinvat Bridge. His actions are weighed in a scale pan, and if the good outweigh the evil, even by the smallest particle, he passes over the bridge into heaven; but if the evil preponderate, he is hurled into the abyss of hell. If good and evil are at equipoise, he is sent to a sort of purgatory, known as Hamast-Gehan. A curious idea is that, as capital increases with interest, so the good and bad of actions increase with the growth of time. Deeds in youth count for more than deeds in age. Five striking engravings illustrate the chief stages of initiation to the Parsee priesthood.

THE MIKADO'S RELIGION.

Shintoism, the State religion of Japan, is expounded from various standpoints. A Christian convert, Matsugama, distinguishes the primitive Japanese faith found in the sacred books *Kojiki* (712 A.D.) and *Nihongi* (720 A.D.), from that subsequent blending with Buddhism which in the ninth century produced Shintoism. Another Japanese Christian declares that:

Shintoism has no written moral code, no system of abstract doctrine, because the laws of God are engrossed in the heart. This indwelling is the living law governing the moral nature. Formal prayer is not of much importance, but believers observe prayer services. Confession of sin is made and the wrath of the Highest Being averted. The Emperor is the representative of the entire nation, and must therefore be its model.

"THE BRAIN OF THE ENTIRE GLOBE."

The most interesting exposition is made by the Rt. Rev. Reuchi Shibata, eleventh president of the *Zhikkô* (practical) sect of Shintoists. The common tradition of all Shintoists is that a generation of deities in the beginning created heaven and earth and all that in them is, and became ancestors of the Japanese, and that two of these deities, male and female, were the ancestors and founders of the Imperial line in Japan. The *Zhikkô* sect teach one original, eternal, absolute Deity, who took embodiment as male and female deities—together forming "the three deities of creation." These originated a generation of deities, who in their turn gave birth to Japan, sun and moon, etc., etc. "As every child of the heavenly Deity came into the world with a soul separated from the one original soul of Deity, he ought to be just as the Deity ordered." The founder of the sect, born in 1541 A.D., received these revelations in Mount Fuji, which is thence regarded as the "abode of the divine Lord and as the brain of the entire globe;" its plain and simple form and serene air being also regarded as moral example and emblem. "We should respect the present world, with all its practical works, more than the future world," and especially regard Emperor and native land.

A SHINTO SCHEME FOR ENDING WAR.

This Shinto prelate reveals his practical aim by the following concluding appeal:

While it is the will of Deity and the aim of all religion-

ists, that all His beloved children on the earth should enjoy peace and comfort in one accord, many countries look still with envy and hatred toward one another and appear to seek for opportunities of making war under the slightest pretext. . . . Now and here my earnest wish is this, that the time should come soon when all nations on the earth will join their armies and navies with one accord, guarding the earth as a whole, and thus prevent preposterous wars with each other. They should also establish a supreme court in order to decide the case when a difference arises between them. . . . There will thus ensue, at last, the universal peace and tranquillity which seem to be the final object of the benevolent Deity.

The Rt. Rev. R. Shibata should go on a mission to the Kaiser of Germany and Czar of Russia.

WHAT THE JEWS HAVE DONE.

The Jews are especially well represented in this volume, having from the first taken a most active in-

RIGHT REV. REUCHI SHIBATA,
High Priest of the Zhikko Sect of Shintoists.

terest in the Parliament. Dr. N. Kohler glowingly insists that the doctrine of the brotherhood of man, based upon the fatherhood of God, is essentially Jewish. Rev. Dr. H. P. Mendes, speaking as representative of orthodox Judaism, finds the fatherhood of God announced by Moses, "Israel is My son, My firstborn," "implying that other nations are also His children." Hence "Malachi's 'Have we not all one Father?' does not surprise us." Thus Israel supplied the ideal of universal brotherhood as well as of universal peace and happiness. Dr. Mendes remarks upon the coincidence: In 521 B. C. Zoroastrianism revived; Confucius was then living; Gautama Buddha died in 534; the Jews had been long in Babylon; there was traffic of merchants between China and India via Babylonia with Phenicia. He affirms that the modern Jews "unite in the belief of the coming

MOHAMMEDANS AT PRAYER.

Messiah," and "believe, soul and might, in the restoration to Palestine, a Hebrew State."

WHAT JEWS HAVE YET TO DO.

Miss Josephine Lazarus declares that "during the last hundred years Judaism has undergone more modification than during the previous thousand years." Now, faced with the ubiquitous anti-Semitic movement, what must the Jew do?

Change his attitude before the world, and come into fellowship with those around him. . . . Mankind at large may not be ready for a universal religion; but let the Jews, with their prophetic instinct, their deep spiritual insight, set the example and give the ideal. The world has not yet fathomed the secret of its redemption, and salvation may yet again be of the Jews.

REMARKABLE NEWS ABOUT ISLAM.

Islam was, perhaps owing to the interdict of the Sultan, poorly represented at the Parliament. Its chief spokesman was Mr. Mohammed Webb, "an American of the Americans," who has been converted to the faith of the prophet. He roundly denies that Mohammed's character was sensual, or that polygamy ever was or is a part of the Islamic system, or that the prophet ever encouraged or consented to the propagation of Islam by force. He "was as thoroughly non-aggressive and peace-loving as the typical Quaker." "Stated in the briefest manner possible, the Islamic system requires belief in the unity of God and in the inspiration of Mohammed. Its pillars of practice are physical and mental cleanliness, prayer, fasting, fraternity, almsgiving and pilgrimage." Mr. Webb's requirements are yet more elastic. "No man is expected to believe anything that is not in perfect harmony with his reason and common sense." Like the Jews, he will not allow the Christians a monopoly

of the two doctrines most associated with their creed. "The Moslem brotherhood stands upon a perfect equality, recognizing only the fatherhood of God and the brotherhood of man."

THE LADDER, THE GATE, AND THE FIELD.

One of the most imposing figures on the singularly picturesque platform was Archbishop Dionysios Latas, of Zante, who represented the Greek Church—"the mother of the Christian Churches," as he called it.

The peculiar feature about his paper is that at a time when Western critics are doing their best to eliminate as alien to the Christian faith the Hellenic elements which have entered it, this Eastern prelate claims for the entrance of just these elements a special divine Providence.

If (said he) the ladder by means of which the Son and Word of God came down from Heaven into the world had its basis on Judaism, if the gate through which He passed was Palestine, still the field, the smooth and well cultivated field on which the Messiah was to sow the doctrines of His Gospel and to reap the fruit of His teaching—that field was the Greek nation, the Greek element, the Greek letters, and the sound reasonings of the different systems of Greek philosophy.

The Armenian Church was represented in essay and person.

HOW IT IMPRESSED ROMAN CATHOLIC HIERARCHS.

The Roman Catholic Church, which has from the first taken deep interest in the Parliament, is admirably represented. Cardinal Gibbons contributes a paper in which he declares that he is more drawn to the Catholic Church by her system of organized benevolence than by her unity of faith, or sublime morals, or world-wide catholicity, or apostolical suc-

MOST REV. DIONYSIOS LATAS,

cession. Which remark explains much in the later developments of American Romanism. Archbishop Ireland promised his active interest from the first. Archbishop Feehan, of Chicago, and Archbishop Red-

sophic movement marked by Renan and Darmesteter, and predicts that France will remain a Christian land.

PROFESSOR HENRY DRUMMOND'S PLEA.

Presbyterianism is well to the fore. Among a host of others, Rev. Dr. Briggs treats of "The Truthfulness of Scripture," Rev. Dr. A. B. Bruce of "Man's Place in the Universe," and Professor Henry Drummond on "Evolution and Christianity." Dr. Drummond glorifies the services which the theory of evolution has rendered to the Church, avers that "there is probably no more real unbelief among men of science than among men of any other profession," and craves for the theological world "a clearing house, a register office, a something akin to the ancient councils, where the legitimate gains of theological science may be registered . . . and authoritative announcements made of the exact position of affairs."

Among other Protestant luminaries may be mentioned Rev. Drs. Lyman Abbott, Th. J. Munger, G. P. Fisher, Washington Gladden, Pentecost, F. E. Clark, G. Dana Boardman, Professors Von Orelli and Richard T. Ely, and Rev. T. E. Slater.

MUGURDITCH KHRIMIAN,
Catholicos of All Armenians.

wood, of New Zealand, took leading part in the opening session, and at the last session Bishop Keane prefaced his discourse on "the ultimate religion" with the beautiful words :

These days will always be to us a memory of sweetness. Sweet it has been for God's long-separated children to meet at last, . . . here to clasp hands in friendship and in brotherhood in the presence of the blessed and loving Father of us all ; sweet to see and to feel that it is an awful wrong for religion, which is of the God of love, to inspire animosity, hatred, which is of the evil one ; sweet to tie again bonds of affection broken since the days of Babel, and to taste "how good and how sweet a thing it is for brethren to live in unity." And we have felt, as we looked in one another's eyes, that the only condition on which we can ever attain to unity in the truth is to dismiss the spirit of hostility and suspicion, and to meet on the basis of mutual trustfulness and charity.

PROTESTANT CHURCHES.

Despite the refusal of the Archbishop of Canterbury to countenance the Parliament, the Anglican Church was represented in person by Rev. Dr. Haweis and Dr. Momerie, and in an essay by Canon Fremantle. American Episcopacy was also in evidence. Count A. Bernstorff reported on the religious state of Germany, "the greatest danger" in which he finds to be the spread of Ritschl's system, but declares that "believing, evangelical Christianity in Germany is more a power now than it ever was before." Rev. G. Bonet-Maury reports from Paris the neo-Christian revival in France, welcomes the sympathetic philo-

RT. REV. JOHN J. KEANE,
Rector of the Catholic University of America, Wash-
ington, D.C.

CRITICISM OF CHRISTIANITY.

The genial spirit which pervaded the Parliament seems to have happily blended frankness with courtesy, and the element of mutual criticism was only helpful. What has been termed the Christianity of Christ was rarely adversely canvassed. The Hon. Mr. Pung spoke somewhat in this vein, though with studied respect. He dismisses the miraculous narratives of the Gospels with scarcely concealed scorn. The Chinese honor Confucius not for miraculous performances of any kind, but for his virtuous example. Marvelous tales are doubtless popular. Chinese works could supply more than ten wagon loads of them. He pities Christian missionaries that they reach only the uneducated and immoral Chinese.

I know that they will quote Christ's words, "I come not to save the righteous but sinners," to refute me. This idea to be sure is excellent, but can hardly be made applicable, it seems to me, to the present state of things.

He urges the missionaries to win the confidence of the gentry, and suggests they be trained also in physical science and sociology and Chinese customs.

MISSIONARIES CRITICISED.

There is much wholesome criticism of missionary methods. Mr. Pung complains that the Christian Scriptures have been execrably translated into Chinese. He also advises that women and girls should not be allowed to frequent churches where men worshiped, but should be taught either at home or in separate assemblies; and that converts be required to support their parents. He earnestly insists on missionaries inquiring into the moral character of their converts.

The Buddhist Mr. Dharmapala complains that missionaries are as a rule intolerant and selfish. "We want the lowly and the meek and the gentle teachings of Christ, not because we do not have them now, but

we want more of them." A Brahman, Mr. Charya, says Christian missions have failed in India because "the religion which a conquering nation, with an exasperating consciousness of superiority, condescendingly offers to the conquered, must ever be disgusting to the recipients, however good it may be," and because "Christians by tacit silence make people believe that the eating of animal food is a necessary preparatory course to baptism." Generally the Asiatics seem to have made their hosts aware that Western religionists impress them as wanting in gentleness and devoutness; the energetic Western temperament is to their mild and meditative Eastern natures something rough and almost brutal.

Several of the non-Christian speakers lash very heavily the unchristian conduct of Christian nations. Mr. Hirai warmly denounces the iniquities caused by the refusal of Christian powers to grant treaty revision to Japan, and the insolent treatment of Japanese immigrants. "If such be the Christian ethics—well, we are perfectly satisfied to be heathen." The Japanese "will not join Christianity as long as they think that it is Western morality to preach one thing and practice another."

Of counter criticism the most defiant is that of the Boston lecturer, the Rev. Jos. Cook. Said he: "I take Lady Macbeth on my right hand and her husband on my left, and we three walk down here. . . . I turn to Mohammedanism. Can you wash our 'red right hands?' I turn to Confucianism and Buddhism and Brahmanism. Can you wash our 'red right hands?' . . . It is a certainty that except Christianity there is no religion under heaven that effectively provides for the peace of the soul."

WOMAN.

Woman is well represented here. Deeply significant is the fact that, as the religions first meet on a com-

MITROFAN, METROPOLITAN OF MONTENEGRO.

ERVAD SHERIARJI DADABHAI BHARUCHA.

mon platform, woman stands there on equal footing with man. Besides women who deliver short addresses, papers are contributed by a score of women, including six "Reverends," two Jewesses, and one Parsee convert to Christianity. Miss Willard describes "A White Life for Two." Lady Henry Somerset writes a characteristically beautiful and thoughtful letter, hoping for "an organized movement for united activity, based on the fatherhood of God and the brotherhood of man." Mrs. Ormiston Chant discoursing on "The Real Religion of To-Day," puts the old antithesis of justification by works and faith in the new way—that "man's duty to God" is receding before the idea of "God's duty to man." Non-Christian contributors are generally careful to state the attitude of their faith to the claims of woman.

DR. SCHAFF INVITES THE POPE TO HEAD REUNION.

"I was determined to bear my last dying testimony to the cause of Christian union." So said the Rev. Dr. Schaff, scarcely aware how near his end was. His testamentary utterance is worthy of the man. All churches, he urged—Greek, Roman, Protestant—shared in the sin of schism. Yet "negative reunion, which would destroy all denominational distinctions," would be untrue to the Providence which had produced these distinctions. "A confederation of all English-speaking Evangelical Churches, and possibly an organic union," is chiefly hindered by the "historic Episcopate;" but Dr. Schaff hoped the Episcopal Church will interpret the historic Episcopate as "locally adapted," so as to include the "historic Presbyterate." But, Protestants united, "union must include the Greek and the Roman Churches." If any church, then one of these must be "the centre of unification." These two must come to agreement on the procession of the Holy Spirit and the authority of the Bishop of Rome. Dr. Schaff makes the curious proposal:

What if the Pope, in the spirit of the first Gregory and under the inspiration of a Higher Authority, should infallibly declare his own fallibility in all matters lying outside of his own communion, and invite Greeks and Protestants to a fraternal pan-Christian council in Jerusalem, where the mother-Church of Christendom held the first council of reconciliation and peace?

Canon Fremantle expresses himself as looking to the development of faith as opposed to systems and of the social movement as leading to reunion. Cardinal Gibbons supplies a proof of this latter tendency when he says, "Though we differ in faith, thank God there is one platform on which we stand united, and that is the platform of charity and benevolence." On this platform a wider than Christian union is shown to be possible in the common agreement

against war and destitution, and even in some of the methods of remedy.

THE ULTIMATE RELIGION?

There are occasionally tentative outreachings after some all-inclusive religion yet to be evolved. Dr. A. Réville lays down what he considers to be the scientific conditions of it. Professor D'Vivedi and the monk, Mr. Vivekananda, seem to conceive of it as a further expansion of the accommodating Hindu system. Japanese Buddhists call their faith "the synthetic religion." But Dr. Barrows reports that "no religion, excepting Christianity, put forth any strong and serious claims to universality." The eagerness with which all faiths, excepting perhaps the Confucian, sought to lay claim to the doctrines of the Divine fatherhood and human brotherhood is deeply significant to the believer in the New Testament.

We have here touched on but a few aspects of this multitudinous array of religious thought. There are whole mines of theistic and Christian evidences, of general and special social ethics, of projects for co-operative work and study, of pleas for certain forms of church government, etc., etc., which we have not sampled here. But the general impression left by this unique volume is certainly not in the direction of any eclectic syncretism or colorless pan-religionism. It is, to the Christian at least, emphatically Christian. The Archbishop of Canterbury, if he reads this record, will be glad to repent of his suspicion that Christianity would be degraded by entering into friendly consultation with other faiths. The comparison will doubtless act as a powerful solvent to any version of Christianity which is compounded of bigotry or haughty exclusiveness. It will tend to dissipate such Christianity as consists merely of a bundle of ideas caught up out of the teaching of Jesus, for Jews and Moslems and Parsees are quick to claim these as their own. But it has only brought out into fresh clearness the element that is vital in the Christian faith. The ultimate and universal religion, Professor Goodspeed has said, "is not so much Christianity as Christ. Such was the deepest voice of the Parliament." Such undoubtedly is the deepest dint left on the mind by perusal of the record.

It is thus easy to understand the prediction of a participant, "A new impetus will come to Christian missions." But the impetus is one that must not a little modify their methods, and breathe into them a larger and gentler spirit. Liberal, evangelical, and Catholic Christians alike have come away from the Parliament, confessing to a new Divine impulse. To appropriate and assimilate what was then received is now the privilege of English-speaking mankind.

MISS CLARA BARTON AND THE RED CROSS.

A STUDY OF RELIEF WORK AND OF AGENCIES TO MEET SUFFERING FROM
WAR, PESTILENCE AND CATASTROPHE.

BY SOPHIA WELLS ROYCE WILLIAMS.

THOSE who remember the outburst of philanthropic aid conducted through the Sanitary and Christian Commission during the years of our civil war have probably seen in the winter just over greater aid stretched out for those who sit in affliction than at any time since that period. During no winter for twenty years has the attention of so many people been drawn to the aid of the suffering both at their doors and throughout the land. This renaissance of relief at a time when the current catastrophe is only commercial is due to two causes: first, to the dire distress of the day, and second, to the growing popular habit of effort to relieve the suffering caused by great disasters as well as to meet more regular and constant demands. This increased effort for increased need is but a step in the steady Christianization of society.

An examination of the great disasters of the past twenty-five years, culminating in the horror of Johns-

formed for the occasion. Yet at all, praiseworthy work has been done by the National Red Cross Society. Probably the most conspicuous before the public in the last ten years of relief work has been Miss Clara Barton. Who is Miss Clara Barton? The originator of the Red Cross Association in this country. What is the Red Cross Association? This is a more difficult question to answer. To-day Miss Clara Barton, at sixty-four, after thirty years of work in relief of the misery of battle and disaster, is a slight woman, rather under sized, with soft brown eyes, thin gray hair and a large mouth—rather strong withal. Her hands are small, soft and delicate, freely used in gesture and emphasis during conversation. In talk she is, as might be expected of the woman of the lecture platform, the committee room and the wide direction of extensive work, rapid, quick and voluble.

FROM FARM TO HOSPITAL.

She was born in 1830, of farmer parents, at New England Village, a small hamlet near Oxford, Mass. After going to school in Oxford, she taught for a while a country school; then went into a factory as cloth trimmer; again taught until she had succeeded in saving money enough to give her a year's study at Clinton Liberal Institute. From there she went to Bordentown, N. J., where she taught a free school until her eyes gave out, when, during Buchanan's administration, she obtained a position in the Patent Office at Washington. On the death of her father shortly after, she took up the mortgage on the small farm, settling with her family. Her brother, who owned on the James River a turpentine distillery, knowing that it was certain to be destroyed by the Union forces, is said to have agreed with the Confederate commander to set fire to it when General Butler's army should reach a certain point. This was done, but he was captured before making his escape. Hearing of his capture, Miss Barton conceived the idea of going down to General Butler's headquarters and making an effort to liberate her brother. She obtained a substitute for her position in the Patent Office, with whom she shared its pay. Just before the battle of Bull Run, she advertised in the Worcester (Mass.) papers, saying she would receive stores and money for the wounded soldiers at the front, which she would personally distribute. The appeal was so liberally answered that she filled a building at Seventh and Pennsylvania avenue and went to the front, where she succeeded in getting her brother paroled. He died in the autumn, again needing her interceding efforts, and she continued her work, nursing and

MISS CLARA BARTON.

town, will show that the largest expenditure and the most efficient and prompt aid has been given the greatest calamities, from the Chicago fire to the Johnstown flood, by organizations and committees

relieving suffering, supplies continuing to come to her until nearly the end of the war.

DORRANCE ATWATER'S GREAT SERVICE.

Her work was entirely independent of any of the State organizations and of the Sanitary and Christian Commissions. On returning to Washington she petitioned Congress, through Henry Wilson, for \$15,000, in payment for her services "in endeavoring to discover missing soldiers of the army of the United States and in communicating intelligence to their relatives." A bill was finally passed giving her \$15,000 for expenses already incurred and for services to be rendered, that appropriation having reference to her proposed search for the graves of soldiers, unknown, missing or unrecorded, in Southern prisons and elsewhere. The path to this work opened for Miss Barton through the records kept by Dorrance Atwater, a Connecticut boy prisoner at Andersonville. He had been detailed to keep for the prison authorities a record of the dead and their burial. Thinking that their people at home would like, if possible, to know, he preserved sometimes on a bit of paper, sometimes on a rag, or anything that he could get and kept always concealed, a duplicate set of records, with the graves carefully indicated on a plot of the burial ground. On being liberated he was sent home and lay for weeks on a bed of illness. As soon as he was able, he wrote the War Department that he had 15,000 names, and that the graves ought at once to be marked or the summer's rank growth would render it impossible to identify them, so slight were the present markings. The Department pigeon-holed his letter and lists, refusing to return them, but gave him a place in one of the departments. One day he saw in the post office a notice asking for information of the burial of dead Union soldiers, and signed "Clara Barton." He wrote to her and offered her the 15,000 names if he could get them. With her assistance he succeeded in obtaining them from the War Department and had at once a boat put at his disposal,—boards and nails and paint, with carpenters to make the wood into head-boards, and was sent to mark the graves more permanently. Miss Barton accompanied him and together thousands of graves were marked at Andersonville and elsewhere, the work at Andersonville depending altogether on the Atwater records.

LIFE AFTER THE WAR.

Her war labors over, she sought the lecture platform and made an arrangement with a New York lecture bureau to lecture for 300 nights at \$100 a night. She was well advertised and managed, and drew crowded houses almost everywhere she went.

In the spring of 1867 she broke down. In seven years she had freed herself from clerical thralldom, organized her own work for the wounded and secured the opportunity to rescue these unmarked graves from forgetfulness and given two winters to lecturing. In 1869, nearing her fortieth year, she went abroad for necessary rest and recuperation. The next year the Franco-Prussian War broke out,

and Miss Barton did some effective work among the wounded, especially at Strasburg. From Strasburg she went to relieve the suffering after the fall of the Commune in Paris. Her services won her the Prussian order of merit, gave her acquaintance with the working of the Red Cross agencies in Switzerland and Germany, and brought her under the notice of the head of the latter society, the Empress Augusta.

DECORATIONS ABROAD; NEGLECT AT HOME.

As the result of this and other visits and services, Miss Barton has received an amethyst cut in the form of a pansy, the gift of the Grand Duchess of Baden, her personal and beloved friend; the jewel of the American Red Cross, the Servian decoration of the Red Cross, presented by Queen Natalie; the Gold Cross of Remembrance, presented by the Grand Duke and Duchess of Baden; a Red Cross medal, the gift of the Queen of Italy, and an English decoration, pinned on her dress by Queen Victoria's own hand. When all was over Miss Barton returned from Europe to find, as many others have done, who have won for themselves fame abroad, that her work was almost wholly unknown here. The bitterness of the disappointment only those can appreciate who have felt it. Coming as it did after a severe strain, the result was a long and serious illness, which resulted in her spending seven months in the Columbian Hospital at Washington. She spent the Winter of 1877 in Washington, endeavoring to get the Red Cross Convention signed. The summer of 1877 was spent at Dansville, and the winter of 1878 again found her at Washington, where she met with no further success, and she again returned to Dansville. During the winter of 1879 her sympathizers to whose care she had intrusted the pushing through of the Red Cross Convention, wrote her that it would be signed in a few days. For reasons of her own Miss Barton ordered proceedings stopped at once. In the spring of 1881 she herself came on to Washington and succeeded in getting the convention signed, while Congress passed the needed legislation.

THE UNITED STATES SIGNS THE PACT.

This action was reached as a result of pleas addressed by M. Gustave Moynier, the originator and president of the Swiss Red Cross Association, to President Garfield, and answered in a sympathetic letter by Secretary Blaine in May, 1881, just before the President's martyr death. On May 21, 1881, an association was formed in Washington, D. C., to be known as the American (National) Association of the Red Cross, and a constitution was adopted, the first article of which requires that its office be located at Washington, D. C., and another that the association "shall consist of the subscribers hereunto and such other persons as shall hereafter be elected to membership, and it shall constitute a Central National Association with power to organize State and territorial associations auxiliary to itself."

At a subsequent meeting held on June 9, 1881, Miss Clara Barton was elected President.

The National Society of the Red Cross in Washington is established in a large brick house at the corner of Seventeenth and F streets, N. W., standing on a terrace high above the pavement, a fact which adds much to the impression it makes. The walls of the broad hall running through the center of the house are gracefully draped with the flags of the various nations for whose suffering soldiers Miss Barton has worked. Various Red Cross flags also float from the walls. At the end of the long parlors is a large, beautiful blue and white silk flag of Greece, and in strong contrast with this a large insignia of the Red Cross in its brilliant red and white.

Here Miss Barton makes her home, when not at work in the field alleviating the sufferings of some storm-stricken people.

FIELD WORK OF THE SOCIETY.

Miss Barton's first personal Red Cross field relief work was done in 1882, when the Mississippi river overflowed its banks. Having less than \$1,000 in the Red Cross treasury, she started for the scene of the disaster. Before she had fairly left Washington, the Associated Press wires sent news of the disaster flashing to every part of the country, accompanied by appeals for aid, to be sent at once to Clara Barton at Cincinnati. Aid poured in from every direction. So generous was the response that more came than was needed. Always frugal and careful, Miss Barton put by the surplus for the next great disaster, which soon followed in the overflow of the Ohio in 1883, and of the Louisiana cyclone in the same year. In the following year the Red Cross again found work to do in the overflow of both the Ohio and the Mississippi.

In 1884, the government having appropriated \$3,000 for the purpose, Miss Barton again went abroad, this time accompanied by Mr. A. S. Solomons and Judge Sheldon, to represent the American Red Cross at the International Conference at Geneva.

In 1886 the drouth in Texas necessitated more work by her agents. When the Charleston earthquake occurred, in the same year, Miss Barton was in California, endeavoring to regain her health. She remained until early in December, when she returned by way of Charleston. In 1887 she again represented the United States government at the court of their Royal Highnesses the Grand Duke and Duchess of Baden, at Karlsruhe. In the same year she relieved the sufferers from the Mt. Vernon cyclone.

The terrible Johnstown disaster occurred May 31, 1889. The relief begun by private effort (afterwards organized as the State Commission) was first on the ground, giving most efficient aid in every possible way. Later Miss Barton arrived on the field, after which the distribution of clothing was under the personal supervision and direction of the "National Red Cross Headquarters." The entire sum expended by the society at Johnstown was about \$40,000.

THE SEA ISLAND HURRICANES.

The Sea Island hurricanes, which Mr. Joel Chandler Harris has described in the February and March *Scribner's*, give the last instance in which the Red

Cross has taken the field. In August the low islands which fringe the coast from Charleston to Savannah were struck by one of the West India hurricanes, which in every August and September start in the mid-Atlantic and are first heard of when they strike some island from the Windward Islands to Cuba and then follow a curving path along our coast. Tide and gale combined on that fatal August 28 to strip the low-lying islands along the South Carolina coast of every home and habitation, to destroy crops, to flood every well and to sweep hundreds to death in the wild rush of wind and wave. The population of the islands directly affected is about 9,000. The fringe of coast which felt the storm, whose serious effects did not extend far inland, was about 30,000 to 35,000. If the entire population which received damage along the lower parts of the coast be included, from 60,000 to 75,000 persons suffered loss. Beaufort County, S. C., which felt the worst of the storm, is almost exclusively negro, and each decade sees a smaller white population. In 1870 the county had 5,309 whites; in 1890, 2,695. Its colored population, 29,050 in 1870, had only risen to 31,421 twenty years later. Simple, kind, inoffensive, ignorant, this black population, when its food crops were overwhelmed and its cotton ruined by the hurricane, while hundreds were drowned, was left utterly helpless and unable either to ask aid or to distribute it.

THE NUMBER IN NEED.

The estimate made by Mr. Harris and by Miss Barton is that 30,000 were in need of food. The first aid, within a fortnight after the hurricane, was extended by the Marine Hospital Service, which promptly expended \$5,000. Dr. G. W. Magruder, of the service, found that the territory which suffered most from the storm was about 150 square miles in area and had a population of 9,000 persons, nearly all negroes. Within this area 660 houses were wrecked and 211 drowned. Into this wrecked and disorganized community the calm skill of the Federal service entered. Graves were dug, 195 wells cleaned, seven new ones dug and twenty-three curbed, thirty-nine miles of drains opened and a physician told off to each island. In three weeks 3,709 cases of illness were treated, a third of the population. It is impossible to read the brief, colorless, self-contained report of the self-denying labors of Dr. Magruder and his associates, Dr. Carson, Dr. Copeland, Dr. Allen Stuart, Dr. J. C. Woodruff and Dr. W. P. Gibbes, without profound admiration for the prompt and efficient aid given by the Marine Hospital Service.

"Happily for the country," says Dr. Magruder in closing November 3, 1893, "the colossal work of furnishing subsistence to this large population has been undertaken by the Red Cross Society under the leadership of its president, Miss Clara Barton, who has already for the past six weeks been doing noble work, and it is surely to be hoped that the approach of spring will find another magnificent charity brought to the successful termination which usually characterizes the work of this society." Two months later, Miss Clara Barton made a mid-field report. Assum-

ing control October 2, the Red Cross Society received up to January 9, 1894, \$23,926.36 and on that date all but \$6,383.12 had been expended. Mr. Harris' testimony corroborates Dr. Magruder's prediction. Small rations have been given out, a peck of grits and a pound of pork a week to each applicant, lumber, 300,000 feet, has been bought and distributed, men were paid in rations to rebuild ruined houses and the district made as far as possible self-supporting and self-helping. So far as one can judge, the work of relief has been well done. It has met criticism in some well-informed quarters. The aggregate amount distributed is not large, and the ration small. Much of the repair would doubtless have been done in any case, but it is much to have intelligent direction on the ground and a little aid goes a long way in the simple life of a negro population, living in waters which swarm with fish and who live frugally the year around. Besides its own money receipts, the Red Cross has had to distribute the trains sent South by the *New York World*, large supplies from other quarters and hundreds of packages of clothing. It is expected to continue aid for six months or until the early crops come in. Fortunately, food begins to grow early and the expenditure of \$260 a day in winter cannot be long necessary.

ASSOCIATE SOCIETIES.

Under the Red Cross constitution there have been several "associate societies" established at various points. The first one, known as the "Dansville Society of the Red Cross," was established at Dansville, N. Y. This associate society was the very first to enter the field, sending under care of Major Mark J. Bunnell relief to the flame-stricken people of Michigan in 1881.

The citizens of Rochester, N. Y., were the no text fall into line, under the title of "Society of the Red Cross of Monroe County." They at once sent relief to the burned districts of Michigan under the personal care of Prof. J. B. Hubbell. The Society of the Red Cross of Onondaga County was next formed at Syracuse, N. Y.

The Associate Society of the Red Cross of Philadelphia, of which Dr. Pancost is president, was established in 1886, and incorporated June 7, 1890. It was the first organized body on the field at Johnstown. Thirty hours from the first call to action, "supplied for almost any possible emergency, with food, clothing, medicine and a completely appointed hospital camping equipage, the Field Corps, consisting of surgeons, physicians, nurses, quarter-masters and treasurer, departed for the scene of the disaster. This relief corps of the Philadelphia branch at one time had three hospitals in operation. Of these, the official "Red Cross Field Hospital" was continued until November 19. Then, after feeding over 5,000, caring for 165 hospital cases, fifty-five of which were typhoid cases, and expending \$11,000, the field work, covering a period of twenty-four weeks, was declared finished and the Relief Corps recalled. The hospital buildings, in complete running order, were transferred with all they contained to the care of the

Cambria County Medical Society for the continued use of Johnstown. This hospital stands as a permanent memorial of the world's beneficence exerted in behalf of the stricken city. At the dedication Mr. Robert C. Ogden, of Philadelphia, who delivered the address, made an earnest plea for aid in behalf of the Russian famine. A subscription of \$5,000 was raised and afterwards turned over to Miss Barton. Important as the Red Cross work was at Johnstown, it was after all but a very small amount compared with the \$2,912,346.30 received by the State Commission.

Dr. Joseph Gardner, of Bedford, Indiana, thinking the American National Red Cross ought to own a house in which might be established during times of peace training schools for nurses, storehouses or other such educational, charitable, or philanthropic edifices as its president might deem necessary, and which in times of war should be neutral ground, has recently deeded to this society 782 acres of valuable land in Lawrence County, Indiana. It has upon it a village, postoffice, barns, tenement houses, orchards and forests, including groves of maple, and quarries of Bedford oolitic stone, as well as a river frontage of one mile in length.

THE RED CROSS THE UNITED STATES HAS.

For thirteen years since the United States signed the Geneva Convention the National Red Cross Association in this country has been Miss Clara Barton, and Miss Clara Barton has been the National Red Cross Society. This is natural. It has its disadvantages. It is natural because after sixteen years of unavailing efforts by others, Miss Barton secured the ratification of the Convention by the President and the Senate and the passage of an appropriation by Congress. Under our government a task like this is not discharged in a day. It can only be accomplished by long, unintermitting and patient work, which is called lobbying in a bad cause and exerting influence over legislation in a good one. Enough others had tried. The natural and the better course would have been for the Sanitary and Christian Commissions at the close of the war to merge and continue their existence under the new name suggested by the Geneva Convention. Our war had seen such aid to the wounded as the world had never witnessed. The gathering at Geneva was in part due to our demonstration of what could be done by private effort supplementing insufficient military provision in war. The Geneva Cross itself, long familiar as a badge of aid and mercy with Hospitallers or Knights of Malta, had been used as a hospital signal in our war. It had replaced in our field service the old yellow hospital flag, associated here with yellow fever and pestilence. The Geneva Convention really did little more in 1864 than recognize and embody in the law of nations the ameliorations of the horrors of war which our experience had shown possible. Anxious to adopt and share in the international movement, Dr. Bellows, fresh from his supreme labors at the head of the Sanitary Commission, organized January 26, 1866, at the rooms of the Commission, the "American Association for the Relief of the Misery of Battle Fields; a central national

committee auxiliary to the 'Comité International de Secours au Militaires Blessés,' constituted by an International Conference at Geneva, Switzerland." This cumbrous title expressed the purpose of the new organization which should have been the connecting link between the Sanitary Commission and the new international movement intended to carry on the same work. The association issued two annual reports and then died. It is a way movements have when they are begun in New York and need action at Washington.

For ten years the worthy men in this movement asked our government to sign a convention to which over thirty States had given their adhesion. The most liberal of all nations in practical benevolence in war was proving the least liberal in the far-sighted preparations of peace. What no one else had done the little, gray-haired, voluble, diplomatic, untiring woman at the head of the Red Cross accomplished. She knew her Washington. She had urged claims. She had pushed patience for pension legislation. She gave her whole time to the work. She enlisted friends who did as much as herself. The result was as natural as her success in securing the ratification of the Convention and an appropriation.

THE RED CROSS IT OUGHT TO HAVE.

What the United States ought to have is a National Red Cross Society with a man like Bishop Potter at its head, with Pierrepont Morgan its treasurer, with leading men in our great cities, like Higgenbotham and Armour, and the rest who ran the World's Fair, on its board, with delegates from the Philadelphia College of Physicians and Surgeons and the New York Academy of Medicine and like bodies in Boston and other cities, and the Army, Navy and Marine Hospital Staff, on its board of medical and surgical control and with a constituency representing the entire country. Instead, the country has Miss Clara Barton, industrious, indefatigable, persistent and enthusiastic. For thirteen years the National Society of the Red Cross has been in existence. It has raised great sums. It has had great publicity. The Associated or United Press representative has nearly always been connected with it. It has worked much relief. It has been of great service to suffering humanity, but when one asks for detailed reports, for itemized statements of disbursements, for a careful recapitulation of its labors, its achievements, its failures, its experience and the teaching and lesson of its work—these things either do not exist or are not furnished. "Mid-work" reports are issued while work is being prosecuted and funds are needed, but if full and detailed reports of the work when it is over are prepared, they do not apparently see the light. "Our business affairs," says Miss Barton, "are just as private as any merchant's." The government appropriations are, of course, audited. With Mr. George Kennan as treasurer, it is certain that all moneys passing through his hands are carefully accounted and rigorously audited. I doubt if there ever was a charity which lasted so many years, which has disbursed such large sums and which has been

so constantly before the public but which has so scanty publications. I asked its officers for reports. I pleaded for all its statements, and two or three pamphlets were all I could secure. Manifestly, these things ought not to be. This national body ought to have a national organization, a national board, and reports which would stand as model and guide for all relief work, the country over.

THE RED CROSS ELSEWHERE.

Mark the difference in other lands. In every European country the Red Cross is organized on the lines already indicated as wise for the United States. Ten years ago the British *United Service Magazine* gave an exhaustive account of the Red Cross. The germ of the movement began in the *Frauenverein* of Frankfort in 1813. This association of ladies was strengthened in 1815 by inter-societies in other German cities. In 1854, the work of Florence Nightingale in the Crimea showed the value of personal and private initiative in supplementing military medical service in the field. In 1859, during the Franco-Italian war, a powerful association, eliciting heavy subscriptions, was formed in Austria, which also possesses two permanent organizations in the Teutonic Order and the Sovereign Order of the Knights of Malta which have devoted their old foundations and mediæval machinery to hospital service, special attention being paid to soldiers in time of war. In 1885 the former had forty-three columns ready for the field with three ambulances apiece, one fourgon and one cooking wagon. The Order of Malta has six complete railway hospital-trains, each composed of sixteen carriages.

Switzerland, as in so much else, however, led Europe in this modern movement. The *Société des Secours*, established at Zurich in 1847, was the first permanent organization formed in peace, with medical men and ambulances ready at a moment's notice to take the field, as it has done in every great European conflict since its organization. In 1870 its train was moving the afternoon of the day on which war was declared. Twelve years after its work began, M. J. Henry Dunant, of Geneva, published his "A Recollection of Solferino," an epoch-making description of the total collapse of the French and Italian military medical service after that battle. Translated into many tongues, and widely circulated, it led the Geneva Society of Public Utility to discuss in 1862 "whether means might not be found to form during peace a society whose aim should be to help the wounded during war." In October, 1863, as a result of their action, a conference of the representatives of 16 European governments met at Geneva. The premises upon which this conference acted in adopting the Geneva Convention was that:

"At every period and among all nations, from Cyrus down to Napoleon III, the *personnel* and material of the army medical departments have been insufficient."

The principle of this Convention is simple, though often misunderstood. Surgeons, nurses and ambulance trains had long been held to be non-combatants.

The Geneva Convention declared them neutral, *provided* and this was its important step, they wore the badge of a red cross on a white ground, *which had previously been stamped*, passed and issued by the military authorities. Unless this indispensable preliminary has been carried out a Red Cross Society has no standing whatever. The natural corollary of this proposition is that in all European countries, where fighting is serious business, the Red Cross Societies are in intimate relations with the military medical staff and under government patronage and supervision. In England this relation is less intimate. In this country it scarcely exists, though nominally recognized.

This relationship is made clear by Mr. John Furley, of London, in a paper on "Red Cross and First Aid Societies," kindly furnished me in proof by Dr. Hurd, of Johns Hopkins University, and earlier by the same contributor in the *Nineteenth Century* of December, 1885. At that date thirty-two National Red Cross societies had been formed. Each is independent. Each has its own methods. Each, it must be remembered, has no rights in time of war except as its badge reissues from the military authorities. To promote the mutual working of these societies, after the first conference in Geneva in 1864, another was held in 1868 and three conferences since, in 1867 at Paris, at Berlin in April, 1869, and in Geneva in 1884.

GERMANY, FRANCE AND OTHER COUNTRIES.

In Germany, as might be expected, the most complete organization exists, loose in peace, rigid in war. Various aid societies exist in the several States, one of which, the Samaritar Verein, follows closely the lines of the English St. John Ambulance Association. In war, the direction of these branches is centralized under the Chief Committee of the German Association of the Red Cross. This body of delegates has as its presiding control a commissary inspector acting on behalf of the government. The Empress Augusta was the real head of the movement and she has a worthy successor in the present Empress. When the Franco-Prussian war broke out this society had \$2,900,000 in its treasury. It is probably better provided to-day. Ten years ago it had 600 female nurses, 120 male, and organizations in 35 large towns ready to take the field.

In France, three societies, L'Association des Dames Françaises, l'Union des Femmes de France and the Société de Secours aux Blessés (the last the French Red Cross), are by decrees of 1884 and a more recent date given legal authority to co-operate in war with the Military Sanitary Service, their presidents placed in direct relation with the Secretary of War, their delegates accredited to each corps commander and all aid given in war directed in this way through a single channel. The French Red Cross has an ambulance force at each corps headquarters, keeps up depots of supplies, a force of registered surgeons and nurses, turns out at manoeuvres and in peace pursues the pious task of erecting tablets over the graves of the French dead, this having been done in 171 German towns and villages.

The Russian Red Cross Society has a well-defined

relation to the Headquarters Staff and the Medical Department. In December, 1877, it was employing ninety doctors, ten apothecaries, one hundred and twenty dressers, ninety students, five hundred Sisters of Mercy, five hundred male nurses and a reserve of four hundred persons. In the war of 1877-8 it established 13,120 beds, with 24,973 more by affiliated agencies, gave succor to 116,296 patients, including 2,863 officers, and lost by death but 2,863 patients.

Each European country has a like organization. Austria centers its committees at Vienna and Budapest. In the Franco-Prussian war they disbursed \$442,000. Italy in the same war united its committees at Milan.

IN CONTRAST WITH OTHER COUNTRIES.

England has its British National Aid Society, the "Red Cross." The St. John Ambulance is an independent body, organized to give first aid to the injured, but ready to co-operate in war. The Volunteer Medical Staff Corps is organized on the army model instead of being, like our National Guard Medical Staff, a scattered and divided body. As the British National Aid Society has been comparatively quiescent in time of peace, its inaction has given encouragement to a number of kindred societies, for instance, the Stafford House and Lord Blantyre's Committees, Lady Strangford's Fund and so on, while the Princess of Wales Branch of the National Aid and Canadian Princess Louise Fund are quite independent. This has, as Mr. Furley points out, "led to a wasteful expenditure of money and energy and created confusion and doubt in the minds of generous contributors."

The absence of any central organization strong enough to command public opinion, control public action and supervise and supplement local and official action has had the same effect here. An expert like Major John S. Billings would undoubtedly advise such a central society. Official Washington would not. The Marine Hospital Service, under the very capable command of Surgeon-General Walter Wyman, has already drawn under its control national quarantine and has its official eye on relief work, towards which it took an important step at Beaufort. When a great disaster comes, like Johnstown, a State Commission steps forward and spends \$3,000,000. Philadelphia maintains, as our French friends would say, *en permanence*, a "Citizens' Permanent Relief Committee," which keeps a fund in hand for emergencies, and this winter has taken charge of the work of relief for the unemployed on a great scale. In New York, the Chamber of Commerce has frequently raised money and superintended relief operations through committees. As Mr. Furley shows, it is an enormous advantage in all work of this kind if stretchers, ambulances, beds, and all hospital equipage, in all places are on a common pattern, registered under a common organization and affiliated. A national organization, carrying the Red Cross, which could secure this and organize local organizations through the country would be in a position when disaster befell in peace or when war came to start all the machinery of relief roundabout.

LEADING ARTICLES OF THE MONTH.

TO THE RESCUE OF THE SEA ISLANDERS.

IT was a happy thought that suggested to the editor of *Scribner's* the plan of commissioning Mr. Joel Chandler Harris to visit the Sea Islands, which were last fall swept by the terrible West Indian hurricane with such dire results. Mr. Harris and the artist who accompanied him were given every facility to seek out the particulars of the awful calamity, being conveyed in tugs and steam launches from point to point through the sinuous estuaries which cut up and divide this marshy archipelago. No one other than the author of "Uncle Remus" could have given here and there the veridical touches of negro dialect and temperment which go to make up a complete picture of the isolated, hapless community.

The islands are of importance to the outer world chiefly on account of the fine cotton which grows there luxuriantly in response to very little persuasion on the part of the easy going agriculturists. It is of a finer grade than is produced anywhere else in America, and fetches sixty cents a pound when carefully prepared, or twenty-five in the rawest state. The darkies raise it, or rather it raises itself, on comfortable farms which often belong to them, and which are sometimes of ten, thirty or forty acres in extent.

A GENTLE, SIMPLE RACE OF NEGROES.

Mr. Harris removes the popular impression that the inhabitants of the islands are still utter savages. "It is just twenty years since I first saw and studied the speech and characteristics of the Sea Island negroes; more than twenty years since Daddy Jack astonished me with his Gullah talk, half African and less than half English. During that time there has been a great improvement in the negroes of this region. They are still different from their brothers in the upland plantations, but the Gullah element is nearly wiped out and the Congo type is rapidly disappearing. They are not so gay as the upland negro, they do not belong to the same tribes; but they are gentler, they are more unaffected, and there is a flute-like note in their voices, a soft, lilting intonation at the close of their sentences that is indescribably winning."

THE FORCE OF THE DISASTER.

The island had been scourged before by fearful storms, and the oldest inhabitants had set down ten and twenty years as the probable periods of these visitations, but last year broke all these theories and all records. Hurricane succeeded hurricane, and the last fatal storm was unparalleled in ferocity.

"It is," says Mr. Harris, "the most disastrous that ever visited this coast. It struck helplessness where it was weak. It is not to be measured by the destruction of life which it caused, though that was

something terrible, but by the suffering which has followed.

"It is estimated, and the estimate is not in the nature of a rough guess, that two thousand five hundred lives were lost in the islands and on the adjacent coast. The truth would not be missed very far if the number were placed at three thousand. Not all of those were lost in the storm. Two thousand persons, the great majority of them negroes, were drowned or killed on the night of the storm. The others died from exposure, from a lack of food or from the malarial fever that was epidemic on the islands during the hot September days that succeeded the disturbance."

But this *débâcle* did not give the measure of the disaster, for twenty or thirty thousand people were left destitute in the face of the winter months. The stores from the wreck of the "Savannah" saved many from starvation, but they were only a handful, and six months of the leanest variety were before these thousands of poor creatures.

MISS BARTON AND THE RED CROSS.

It was here that Miss Clara Barton stepped into the breach and began relief work in the systematic, detailed method which was necessary in coping with such a giant wolf at the door of these widely separated little cabins.

Mr. Harris says frankly that he set out on his tour of investigation with no enthusiasm for the Red Cross Society and the kind of work he thought it likely to do. But he hastens to announce the error of these preconceived judgments, and to pay a hearty tribute to the noble work which Miss Barton was conducting from her headquarters at Beaufort. "Miss Barton and her assistants had faced a good many emergencies, but I have their word for it that the conditions they were compelled to deal with in relieving the population of the Sea Islands have never been paralleled in all their experience. The problem before them was new, but they had the capacity for organization, the gift of promptness, the quality of decision; they had tact, energy, and enterprise. They knew what was to be done at once, and there was no delay nor yet undue haste in setting the machinery of relief in motion. The local committees turned over everything to the Red Cross, and immediately the work of relief, as distinguished from indiscriminate charity, took form and became substantial.

"Miss Barton had some experience with the negroes of this region in the first months after the war, and therefore had nothing to learn or to unlearn in dealing with them. Her name was known to the older ones, and one old negro woman—Aunt Jane—

who had cooked for her 'when freedom come 'bout,' came thirty miles to see her.

THE DIFFICULTIES BEFORE THE RESCUERS.

"But with all its experience, with all its energy and discipline, the Red Cross Society was compelled to move slowly. It was not superior to the lack of the means of communication. It could not give boats to its messengers nor wings to its messages. All that it could do was to launch some of the boats that had been blown ashore and hire others that had been rescued. Presently, too, the negroes began to recover some of their own boats that had lodged in the marshes, and then the work of organizing relief committees on the islands began. It was slow and tedious. The delay was almost disheartening. Malarial fever was playing havoc with the destitute—not killing them outright, but so weakening them as to cause death from the lack of nourishing food or from exposure; for hundreds were living in the bushes, practically without shelter, and hundreds were without clothes.

"Miss Barton and her assistants adopted from the very first the most rigid system of economy—a system far more efficacious in the end than any lavish dispensation of charity could have been. A peck of grits and a pound of pork—these are the rations for a family of six. They seem at first thought to be a poor excuse for charity, and the negro who goes after them in his little ox cart most likely takes them away with a disappointed look on his face, glancing back at the little bundles as he drives along, or shaking his head doubtfully as he measures their weight by lifting them in his hand. 'Mockin' bud been eat mo' dun dat!' He remembered the days when the government poured out its bounty through the Freedman's Bureau."

THE PRINCIPLE OF SELF HELP DOMINANT.

"In the very beginning one thing was made clear to the negroes—that to get help they must help themselves; that there was to be no indiscriminate distribution of alms. Some of the older ones, remembering the days when the Freedmen's Bureau was in operation, came to the conclusion that the government had charge of the relief funds; but their minds were promptly disabused by the methods which the Red Cross adopted. Was a negro able to work? Then he was provided with tools and material—hammer, saw, nails and lumber—and set to building houses for families of women and children who had been left homeless.

"The first object of the Red Cross Society was to aid the helpless, to succor those who were unable to work or to help themselves; the next was to help those who were willing and able to help themselves. Miss Barton is very much afraid that this part of her work will be misunderstood.

"'I feel that we are standing on the edge of a volcano,' she said, with a smile. 'We have had a very delicate and difficult task before us. It is still before us. I have been doing, and propose to do, only what my judgment and experience approve. But you

know how small a foundation misrepresentation needs for a foothold. I expect to hear any day that Clara Barton and her Red Cross Society are selling—actually selling—the supplies the people have donated for the relief of these Sea Island sufferers. You may smile—I smile myself to think of it—and yet it is a very serious matter. Our regulations do not permit us to give relief to able-bodied men. But these men need relief. There is no work for them to do. They are as absolutely dependent as if they had been crippled in the storm. Yet they are able-bodied; they can work. They need food, they need clothes, and, as the cold weather comes on, their needs will be sorer.'

STORIES OF THE STORM.

Such a story teller as Mr. Harris naturally finds it hard to keep his pen from the instances of individual loss, the pathetic experiences of the blow which left these simple black folk fairly dazed and dumb. He interviews some of the mothers:

"The woman who had spoken for him formed part of a little group standing near. She was rubbing the head of a four-year-old pickaninny.

"'How many children have you?' she was asked.

"'T'ree, suh. Two boy; one lil' gal.'

"'Were any of them drowned?'

"'How dee gwan drown, suh?' she answered, laughing. The intonation of her voice was indescribable. 'I up'd de tree,' she said, after a pause, with a gesture that explained how she saved them. 'Dee choke—dee strankle—I up'd de tree!'. The woman turned and pointed to another woman who was standing apart by the water's edge, looking out over the lonely marshes. 'She los' dem chillun, suh. She have trouble.'

"And so it turned out. This woman, standing apart, as lonely as the never-ending marshes, had lost three children. She had five. In the fury and confusion of the storm she had managed to get them all in a tree. The foundations of this place of refuge were sapped and the tree gave way before the gale, plunging the woman and her children into the whirling flood. Three were swept from under her hands out into the marsh, into the estuary, and so into the sea. They were never seen any more. She had nothing to add to this story as brief as it is tragic. One moment she had five children clinging to her, in another moment there were only two. The angry winds and the hungry waters had torn them from her and swept them out of hearing before they could utter a cry. But what this woman said did not run in the direction of grief. 'I glad to God I got two lil' one lef'. After all, the woman had reason to be glad. Pathetic as her own story was, it was not as touching as another that she told of a neighboring family. She showed where the house had stood, but there was nothing to mark its site, save a blackened stone that had lain in the fire place. Every other vestige of the cabin, and of the other cabins that had clustered near, was swept away.

"'Tirteen in de house, suh,' the woman said, 'I call dem w'en I run. I call dem an' run. If dee make answer I no yeddy dem. Dee gone!'"

A WAIF OF THE WHIRLWIND.

"The negroes at this place had a mystery to deal with, and they were very much perplexed by it. The mystery was in the shape of a little old man, who had come into the settlement in the very middle and height of the storm. The negroes were not afraid of the little old man, but it was plain they regarded him with something more than a shade of superstition. One of the negro men, trying to reach the big house, was tossed by the rising tide against a live oak, into which he clambered with all possible haste. He sat there all night, and at dawn found at his side the little old man, who was not only as contented as possible, but actually nodding on the limb. He was an entire stranger. The negro asked him who he was and where he came from, but all the reply he could get was 'John Omcum.' I spell the name the best I know how, phonetically. It may be Armcome, or Armstrong. But 'John Omcum' was all that could be got out of the little old man in the tree. None of the negroes had ever seen him before, and none had ever heard of him. Where did he come from? Was he blown from Hilton Head Island across the long sweep of Port Royal Sound, or did he drift from one of the little islands in the Chechese River?

"The little old man was pointed out to me. He stood apart, for he was too much of a mystery to invite familiarity on the part of the other negroes. He smiled shrewdly, blinked his little eyes, and seemed to feel some sort of pride in his peculiar position. He was old, and wrinkled, and dried up, and yet wonderfully alert."

RELIEF FOR THE UNEMPLOYED.

TWO valuable articles relating to relief for the unemployed appear in the *Forum* for February, one by Mrs. Josephine S. Lowell, the other by the Rev. Dr. Lyman Abbott. Mrs. Lowell, who is not only a close student of sociological problems but has also for years been one of the foremost practical workers in the relief of distress, points out that our present trouble is an acute disease rather than a chronic condition such as exists in London and elsewhere in England, and emphasizes that in any efforts for relieving the present distress this distinction must be clearly kept in mind, else there is great danger that the chronic condition may be unintentionally encouraged in New York and other American cities. "It cannot," she says, "be too often and emphatically insisted upon that as the chronic distress and the acute distress of the unemployed are distinct in character and due to distinct and different causes, they also affect distinct classes of people and require distinct remedies, and what is said of one may be entirely inapplicable to the other. The problem which confronts us is clearly one of how to tide over a period of temporary distress without converting the acute disease into the chronic condition. The present acute distress may be said, broadly speaking, to be among men and women who have always supported themselves and who have done their best to

provide for the future of themselves and their families; and the want in which they now find themselves is not due usually to moral or intellectual defects on their own part, but to economic causes over which they could have had no control and which were as much beyond their power to avert as if they had been natural calamities of fire, flood or storm.

THE DANGERS IN RELIEF.

"It is evident that to meet this distress measures which would not be suitable in dealing with chronic distress are a necessity. In this case education and moral training are, as a rule, not what is needed, but direct relief of temporary and pressing needs. But here arises the danger of encouraging chronic dependence in the weakest members of the class who are suffering, and, although in regard to the bulk of them there is no such danger, these weakest members must be protected against degeneration while their temporary needs are supplied. Another danger to be guarded against is that the relief offered to those who are only suffering from acute distress, and which is suitable to them, may not reach them, but may be turned aside and seized upon by the people who are in chronic need, and thus both increase the numbers of the latter and aggravate their condition."

To avoid these dangers, therefore, the relief offered must be of a kind which those in acute distress will accept because it does not offend their self-respect, and which will not tempt those in a chronic state to depend upon others. "Relief work seems the natural remedy, but relief work is a very dangerous thing. It tempts the industrious, because it is called work and is usually highly paid as compared with regular work, to leave the latter, which is permanent, and to depend upon the relief work, which soon fails them; and it tempts the unstable and the lazy because it is not continuous, and they are allowed to work in a slack and unworkmanlike manner." Relief work to be a benefit and not an injury must, Mrs. Lowell declares, be continuous, hard and underpaid. A regular day's work for six days in the week must be given. The work should not be advertised, for publicity will only attract a large number of persons to whom work cannot be given, and the result will be disappointment and added trouble to those managing the enterprise.

The reason for the difficulties presented in dealing with the question of relief for the unemployed Mrs. Lowell finds in the existence in every community of two classes of persons who are a constant burden upon the public, and who are distinct from the genuine workers, whether the latter be in distress every winter or only once in ten years. First there are the tramps, vagrants or laborers who, whether by their own fault or not, have become so unfit for regular work or decent living that they require a course of severe discipline before even an attempt to reform them can be made. Next the regular "relief seekers," who often have many virtues, but whose distress is due to inherent defects either of mind, body or character. These two classes are only encouraged in

their weakness by charity. Neither of these classes are included among the unemployed, although both complicate every attempt to relieve the distress of the other.

"But the greatest danger of all in trying to find artificial means of support for any class of men or women is lest, by the very means which are adopted to help one hundred or one thousand, ten thousand should be injured. The sole permanent dependence of the great mass of the toiling, striving men and women who carry on their weary tasks without comment or complaint is regular work, and if, by the attempt to supply the comparatively few who have temporarily lost this resource, there is any interference with trade or the regular market, which reacts unfavorably upon the producers, a greater mischief has been done than any amount of relief work or charitable effort can repair or atone for."

The Church's Opportunity.

Dr. Abbott's article is entitled "The Personal Problem of Charity." He, also, condemns careless and indiscriminate giving, and for the same reasons advanced by Mrs. Lowell, namely, because it aggravates the evil it pretends to cure, confounds the innocent with the guilty, and always degrades and angers the honest and deserving poor.

In such times as these Dr. Abbott believes that every man should guard against adding to the general distress by increasing the number of the unemployed, and that business should be carried on when no profit results, and even temporarily at a loss. He urges the rich manufacturer and business man to follow the example set by Mr. Carnegie, who recently announced that his mills will continue to run, notwithstanding the depressed state of business.

In conclusion, Dr. Abbott sets forth the duty of the Church in this time of distress: "The Church of Christ has a great opportunity before it. Will it see and lay hold upon that opportunity? We have been asking ourselves, Why do not the poor come to church? Now the question is reversed: Will the Church go to the poor? I do not mean in contributions to 'organized charities,' but in personal visitation. In Christ's picture of the judgment he does not say to the righteous, 'I was an hungered, thirsty, a stranger, naked, sick and in prison, and ye sent a secretary unto me,' but 'ye fed and clothed and visited me.' Now is the judgment day of the Church of Christ. And it is not enough for the Church to take care of its own poor. Some unhappy churches have no poor. Every city church ought to fix the geographical limits of a parish, for which it should assume responsibility, and, either alone or in conjunction with some other church or churches, should undertake to visit the entire district and ascertain where there is distress to be relieved. In this visiting the object should not be to do detective work—that is, to discover fraud; nor to do inquisitorial work—that is, to pry into the history of the family, rake over its past, learn its history and sit in judgment on its faults. Neither, on the other hand, should its object be the mere distribution of clothes,

food, fuel and money to any one who asks for it, on the principle of giving to those most who claim the most. It should be sympathetic, kindly, helpful, cautious. It should have experienced supervision, and supplies should be given out with caution. It is better to sell than to give, and to give a little rather than much, and never to give at all except with personal inquiry or personal knowledge, and as the expression of personal sympathy. But if cautious and experienced visitors cannot be secured, I would encourage incautious and inexperienced ones to undertake the work. Inexperienced love is better than none at all. Between sympathy without wisdom and wisdom without sympathy is a hard choice, and we ought not to be driven to it. But if the choice must be made the unwise sympathy is better than the unsympathetic wisdom; wisdom will be required in the work, while the suspicious and unsympathetic heart will grow more suspicious and more unsympathetic."

Set the Unemployed at Work.

The exceptional amount of enforced idleness at the present time justifies exceptional public measures. Subscribing to this view, Mr. George Gunton, in his *Social Economist*, considers the question how to give relief to the temporarily unemployed without humiliating or, perhaps, degrading them by offering charity. The question, then, as it presents itself to Mr. Gunton, is not how to give charity, but how to give employment. Furthermore, he maintains, the situation is such that it is not enough that the rich expend more freely than usual, instead of economizing in every direction, or that workshops be opened for the manufacture of various kinds of wearing apparel to be distributed among the needy classes. These methods of relief have their merits, and should be encouraged, but they are not adequate to meet the general situation.

Mr. Gunton suggests a way, however, that employment can be given to an almost unlimited number for a short time, and where the work is greatly needed—namely, in public improvements. Now is the time, he declares, for the large cities, as New York: 1, To repave and asphalt all the streets that need it; 2, remove and condemn some of the worst tenement-house property, and wherever possible to convert the place into public squares and parks; 3, to plant trees on all avenues and streets where it is feasible so to do. Besides benefiting the poor, this would improve the value of property, beautify, and in other ways benefit our cities.

How Not to Help the Poor.

In the February *Chautauquan* President John H. Finley, of Knox College, tells "How Not to Help the Poor," a subject which he is peculiarly able to discuss on account of his long connection with the organized charity work of New York. He asserts that an increase of pauperism is certainly incident on "charity" which is not carefully discriminating; most of such giving never reaches the really needy cases, and he attributes a large part of it to the motive of egotism.

A SOLUTION OF THE SOCIAL PROBLEM.

"Cultivate Your Own Tastes."

"THE Social Ministry of Wealth" is suggestively treated by Prof. H. C. Adams, of Michigan University, in the *International Journal of Ethics*. He finds the three great stages of the evolution of liberty in: 1, the Mosaic cosmogony which declared man created to rule nature, and so emancipated the mind from superstitious regard for natural forces; 2, the movement begun by the English peasant's assertion in the thirteenth century of "the right of his own personality," and carried on through the Reformation to the middle of last century, which emancipated man from the slavery of superstitious regard for established institutions; and 3, the advent of machinery, which "means the deliverance of man from the necessity of arduous toil in order to attain the means of satisfying a rational existence, and it works this deliverance by bringing under man's direction the boundless forces of nature."

"THE POETRY AND PROPHECY OF MACHINERY"—AND ITS DANGER.

This is "the poetry and prophecy which lie in machinery." But everything depends on the use to which the new wealth is put. "Let it be assumed that the inventor has geared the rays of the sun to the shaft of industry, so that power is as free as light. It still remains an open question whether or not this conquest over nature will gain for man the freedom for which his soul longs. Judging from the use that has been made of wealth on the threshold of this era of opulence, it seems doubtful if the passions and petty ambitions of men will permit wealth to fulfil the mission to which it is called by the logic of history.

"The character of civilization built on machinery will be determined not by machinery, but by the purpose of the men and women who compose society. We have not yet proceeded far enough in the era of opulence to permit it to assume a determined and final character. The material of our social structure is yet plastic and may be molded to fit our desires.

"If labor-saving machinery be used so as to provide absolute leisure for the few rather than to save labor for the many, the overthrow of our civilization will be the inevitable result. In this I speak as an economist, and after a critical analysis of the causes and tendencies of commercial crises and commercial depressions."

The false principle that labor ought to cover all the waking hours of life must be dismissed. The burden of toil which becomes felt in the last hours of the working day must go. Himself an avowed individualist, Mr. Adams warmly supports Mr. William Morris's demand that "labor must be pleasant, and nothing should be made by man's labor which is not worth making." He insists that "wealth will not perform its true ministry until it is so distributed that the necessity for excessive toil shall disappear."

"THE GOSPEL OF BEAUTY RATHER THAN OF DUTY."

But how is this better distribution to be effected? Mr. Adams' answer is disappointing. He enforces

Mr. Ruskin's advice to the consumer, who, he says, holds the key to the future. "It is in their capacity as consumers that the common people enter into their dominion of power. . . . All one has to do is to cultivate his own tastes so as to desire those things which are worthy because they are beautiful and useful. . . . If you demand worthy things, the men who make them will grow into worthy lives, but if you demand what is unworthy they will be condemned to wearisome labor in order to gain the means of continuing a life that has no worthy end. Work, then, must be made worthy for the sake of the worker.

In the second place the desire of a pleasant life must be made to supplant the passion of accumulation.

"What the world needs at the present time more than anything else is the development of the amenities and courtesies of life. It is the gospel of beauty rather than the gospel of duty which fits the requirements of our times. If life could be made pleasant, so that business would be an adjunct to living rather than, as in so many cases, living an adjunct to business, the industrial phase of social activity might be confined to its proper place. . . . Men will no longer continue to accumulate beyond the requirements of rational living, but having provided for themselves, will step aside and give opportunity to others."

Thus "the slavery of the business man to the fascination of his business" will be broken. "A man of fortune who desires to exert an enduring influence on his times can do so by making ample provision for presenting the highest grade of music, drama and art to the student at any of our great centres of learning."

He can thus cultivate tastes in youth which will outmaster in later life the rage of accumulation.

"All one has to do is to cultivate one's own tastes," so as to buy only worthy things, and so as to wish to retire early from business! The process may be accelerated by men now rich using their superfluous wealth to cultivate other people's tastes as well. And this is to usher in the era of man's real freedom, and to carry out the logic of his history!

OLD AGE PENSIONS A DEBT, NOT A DOLE.

THE State has created old age distress; therefore the State is bound to relieve it. This is the point of a clever plea for old age pensions advanced by Mr. M. J. Farelly, of the Inner Temple, in the *International Journal of Ethics*. The State, he points out, has in the interests of the king and lord and trader brought about in England "the dissolution of the family and the separation of the family from access to the land." It abrogated family rights by the introduction of primogeniture, by allowing disposition of property during life and disposition of property by will, and by giving the creditor priority of claim to the widow and orphans. It broke up the manor, confiscated common lands, and allowed creditors to seize the villein's land. The "emancipation" of the villein was really his expropriation. The "separation of the family from capital" was thus

brought about. The State suppressed combinations of labor and fixed wages. It lowered wages by vagrant acts and poor law, also by altering the incidence of taxation when it relieved landholders of military burdens. In the misappropriation of the lands of the monasteries and of the trade guilds the State suppressed endowments for the sick and disabled, and for the aged, the widow, and the orphan.

HIGH WAGES THE CAUSE OF CHEAP WORK.

IN the *Edinburgh Review* appears an article on the subject "The Economy of High Wages." The writer reviews an American work of that title by Mr. J. Schoenhof, a widely traveled investigator of industrial questions, along with a German book on "The Relation of Wages and Working Hours to Work Done," by Professor L. Brentano. Both authors, the academic man and the practical, answer in essentially the same way the question, What constitutes cheap labor? The high quality of labor, say they, which means highly paid, well-educated and short-houred labor. With Adam Smith "the axiom," previously current, "that low wages means cheap work," entirely disappears from the writings of English economists. Experience was against it. Contractor Brassey found that the cost of unskilled labor was the same all the world over; "what was saved in wages was lost in efficiency." French and German and English Commissions indorse these views. In Prussian mines it has been proved that the output rose or fell with the rate of wages.

SHORTER HOURS, GREATER PRODUCTION.

The shortening of the hours of labor was brought about in this country on physical and moral grounds, "in the teeth of economists and practical men alike." Not a single economist raised his voice in its favor. But the hard facts of experience have declared for the humanitarians and against the economists and capitalists. Though wages are lower and hours longer, the cost of cotton spinning is greater in India than in England. "Well may Mr. Mundella say that the long hours of labor on the Continent are our chief protection against competition from that quarter." "Short hours are the explanation of American superiority in production." Experience in all parts of the civilized world swells "the chorus of agreement in the statement that shortened hours have resulted in greater production, and consequently have been to the gain of the employer, as well as of the employed."

HOW MACHINERY ELEVATES THE LOT OF LABOR.

"That high wages and short hours of labor may and do go hand in hand with a low cost of production is now regarded as an economic truth proved by experience. . . . *Ceteris paribus*, in proportion as the laborer is well fed, well clothed, well housed, so will be the value of his labor, and his wages, therefore, may be regarded as an investment by his employer, which will bring in a greater or a smaller return as they are on a liberal or a niggardly scale.

"The strain upon laborers grows greater as the use of machinery is extended and the motive power grows stronger. Qualities hitherto by comparison neglected come rapidly into demand. It is no longer muscular power which is the sole or the principal qualification; mental clearness, grasp and elasticity, moral self-control and trustworthiness, come more and more to take its place as characteristics of a valuable laborer; for the direction and control of machinery so costly, complicated and delicate cannot be safely intrusted to the ordinary workman. Every year the number of spindles which a man supervises and the pace of them grow greater, and . . . the growth of nerve-power necessary for work at such tremendous pressure is possible only when the conditions of life are favorable—in short, when wages are high.

"Low wages are found, as a rule, to go with ignorance, but it is the educated laborer who is really productive, and to whom, consequently, his employer is able and willing to pay high wages."

WHAT IS NEEDED FOR THE FUTURE.

The reviewer thus summarizes Mr. Schoenhof's somewhat optimistic views: "High wages cheapen production in two ways. They make the laborer more efficient—he is stronger, more capable, more alert, and consequently the product of his labor is greater, increasing proportionately faster than the rise in wages. They also provoke, and indeed necessitate, a constant growth in the productive power of machinery, and give the maximum of stimulus to the inventiveness of its makers. Short hours of labor produce similar results, for employer and employed are under every inducement to greater application on the one side and economies on the other, lest the volume of production should be lessened. And in proportion as wages rise, so does the demand for the products of industry rise also; for the working class—i.e., the great majority of consumers—are able to purchase more. What, then, is needed in the present and the future? More light and air for production; the abolition of all restraints, protective or otherwise, upon exchange of commodities; the increase of competition everywhere. At the same time, no agency should be neglected which will help to increase the laborer's efficiency. His home, his food, his surroundings should be jealously guarded; art schools, museums, libraries, all that goes to improve his mind, should be provided without stint."

These conclusions are confirmed by Professor Brentano's more psychological investigations, and the reviewer holds that "the future of the laborers themselves is bright with hope."

ONE remark by Dr. Stanton Coit in the *International Journal of Ethics* is worth laying to heart: "The true and abiding social settlement, that which will succeed and render unnecessary the University Settlement, will be one of educated families. Whole families must and will feel 'the subjective necessity for social settlements.'"

A TALK WITH A TRAMP.

MR. JOSIAH FLYNT continues his stories of tramp life, made "on the road," in the February *Century*, telling of a journey he made in the guise and with the accoutrements of a "bum," from New York to Buffalo and back. He began with a capital of three dollars, one of which was paid for a ticket on the Albany boat, and the other two of which were stolen on that ride by the Italian venders with whom he rashly associated. The ethics, the occupation and the dialect of the American "bum" are well suggested in the following conversation which Mr. Flynt had with a companion in his profession:

"He tried to persuade me to go South with him, and claimed that Yonkers Slim was going to meet him in Washington with some money, and that the 'bums' intended to have a great 'sloppin'-up' (drinking-bout). I made him understand that I was determined to go West. Then he gave me some advice which was typical.

"Young feller, you're goin' to a pretty poor country. Why, when I left Buffalo two weeks ago the bulls [police] were more than pinchin' the tramps right in the streets and givin' them ninety days. The only decent thing about a journey up that way is the New York Central Railway. You can ride that to death. That's the only godsend the country has. Jes let me tell you, though, what towns it cuts through and then you'll squeal. Now, there's Schenectady. You can chew all right there, but divil a cent can you beg. Then comes Fonda, and you must know what a poor town that is. Then you've got Utica, where you can feed all right, for any fool can do that, but you can't hit a bloke for a dime in the streets without a bull seein' ye and chuckin' ye up for fifty-nine days in Utica jail. And you must know well enough what that jail is this time of year—it's jes filled with a blasted lot of gay-cats [men who will work] who've been on a booze. After Utica there's Rochester, a place that oncet was good, but isn't worth pawnin' now since that gay-cat shot a woman there sometime ago. After Rochester, what ye got? You've got Buffalo, the most God-forsaken town a bum ever heard of."

"Here I interrupted my lecturer to say that I had heard of Buffalo as a good 'chewing town.' He turned upon me fiercely. 'What d'yer want? D'yer only want to chew? Don't you want boodle, booze, togs and a good livin'? Of course ye do, jes like ev'ry genooine hobo. It's only a blasted gay-cat that'll fool around this country now. Cig, you'd better come South with us. Why, las' year the blokes more than sloughed in money around the Ponce de Leon Hotel in St. Aug'stine. We ken git there in a week if we ride passenger trains. You'll hustle for an overcoat if ye stay yere much longer, an' I'll bet my Thanksgivin' dinner that every cad you meet up the road is bound South. You'd better foller their coat-tails.' I thanked Yorkey, but satisfied him that I was determined to get to Buffalo. 'Well, so long, blokie,' he said, when I left the camp for Troy."

THE INCOME TAX IN ENGLAND.

"THE English Income Tax" is discussed by the Hon. Sir John Lubbock, M.P., in the *North American Review*. The mode of raising revenue by a tax upon incomes is said to have been introduced into England by Pitt in 1799. The rate was 10 per cent. and it produced about six million pounds. After the peace of Amiens it was repealed on the ground that a tax of this kind should be exclusively reserved for times of war, but was reimposed for the same reason when the war broke out again in the following year. It was very unpopular and was repealed in 1806. The tax was reimposed by Peel in 1842 for practically the same reason that is urged at the present time in Congress—namely, in order that other taxes considered to be more injurious to trade and commerce might be removed. At that time it was over and over again promised that the tax should be only temporary, but it has continued until the present day.

Sir John maintains that the income tax can only be defended as long as it is kept within very moderate limits, and considers that it is open to two objections: 1, That it falls equally upon temporary and permanent incomes and, 2, that the same rate is imposed on incomes derived from individual exertion as on those from real property. Attempts have been made from time to time to repeal the tax, but the country has rejected such propositions. It has in fact become a permanent portion of England's fiscal system

CATHOLIC SCHEME OF GRADUATED INCOME TAX.

THE impetus which the Pope's encyclical on labor is giving to Catholic courage in social reform receives fresh illustration in the *Dublin Review*. Rev. John S. Vaughan, writing on "The Social Difficulty," insists that there is room, and plenty, in the world for all men, and that even the United Kingdom is not fully cultivated. Every man, he declares, has a right to live, a right to all that is requisite to life, and therefore, when he is able, the right to work—a right to what is requisite for ordinary decency and comfort in the present conditions of society. "Every member of the human family should have the means of enjoying the ordinary requisites of life, according to his state, before any should indulge in its dainties or luxuriate on its delicacies. No member of the body politic should be clothed with silk and broadcloth till shivering nakedness has secured a flannel petticoat. What is superfluous belongs to the poor; St. John Chrysostom calls it 'the patrimony of the poor.'" The power of the State should be "more especially at the service of those, 1, whose needs are greatest and, 2, who are least of all in a position to defend themselves." "It is the duty of the State, at all events, to try and diminish, rather than increase, existing inequalities."

96 PER CENT. TAX ON £100,000 A YEAR.

Father Vaughan's first practical suggestion, based on high theological principles, is a fairly drastic re-

form of taxation: "An arrangement somewhat on the following lines, though more nicely graduated, is held to harmonize more nearly with the requirements of justice:

Percentage Levied.	Present Income. £	Gain. £	Remaining Income. £
3 per cent	500	15	485
6 "	1,000	60	940
12 "	5,000	600	4,400
24 "	10,000	2,400	7,600
48 "	50,000	24,000	26,000
96 "	100,000	96,000	4,000

Uncultivated or half cultivated land should also be cultivated by command of the State, and, failing obedience, by the State itself. Hours of labor—especially in mines—should be shortened by State enactment. There is something pathetically ironical in one of Father Vaughan's concluding remarks: "The powerful and cultured leisured classes who are generally credited with breadth of view, largeness of heart, and fairness of mind, should be the last of all to take undue advantage of the accidents of birth and the freaks of fortune, and the very first to hail any practical means of insuring a juster distribution of the good things of this world."

"THE PARALYTIC BANK OF ENGLAND."

IN this month's *Investors' Review* Mr. Wilson renews his strictures on the Bank of England. He is greatly indignant with Sir William Harcourt for refusing to make an examination of the "ancient fabric." He says:

"The Chancellor of the Exchequer does not want to be bothered about it, likes to take life as easy as he can, knows little about finance and cares less, and is, in addition, not a man gifted with the pluck necessary to one who would really tackle the hoary abuses which are a permanent source of danger to the nation, which, if much longer neglected, may, one of these days, tumble all our banks in the ditch together.

"To assume such an attitude is to exhibit hopeless obliviousness on the part of the board to its own condition and incapacity. For twenty years and more the Board allowed the late chief cashier to be its master. What he ordered the Governors to do they mostly did without a murmur. Though the scandal of his stock jobbing was well known outside, the Board seemed to know or think little of it. He did pretty well what he pleased with the money in the Bank's custody, and so far as is known never a director said 'you must not.'"

Mr. Wilson has apparently by no means exhausted his arsenal. "From many points of view, besides this one of the incapacity and weakness of its Board, the position of the Bank of England requires to be looked into with a view to reform. Its monopoly has been suffered to exist far too long for the good of the community, and for the best interests of Imperial and domestic banking credit. Wisely reformed now the Bank might flourish still, and be stronger in the future than it has been for generations. Left alone it must continue to drift and to drag other banks

more and more into the sphere of its own weaknesses."

He animadvert strongly upon the fact that since 1879 the Bank has ceased making the annual parliamentary return required.

THE INDUSTRIAL CRISIS OF THE SOUTH.

IN the *Sewanee Review* Mr. George F. Milton sets forth clearly and forcibly the manner in which the recent industrial crisis in the South was brought about. He devotes the first seven pages of his article to enforcing the economic truth that any careless waste or consumption of material is harmful to the community, and then proceeds to apply this principle to the conditions which for the last few years have obtained in the Southern States. The development in this section since the war has been chiefly of an industrial nature. The discovery of the availability of the great iron and coal fields of the Southern Appalachian system attracted a large investment of capital and a great immigration of population. The older agricultural regions have also had a substantial growth, but the great stride has been in manufacturing. Some idea of the magnitude of this development is had when it is considered that in the steel and iron industries alone the capital invested has increased from \$13,000,000, in 1870, to \$50,000,000, in 1890. "In Tennessee alone, the production of coal has increased from 350,000 tons, in 1873, to 2,527,000, in 1891. The natural effect of this great development of mineral resources has been a very rapid increase of wealth and population in these regions. This has been especially true of Southwestern Virginia, Eastern and Middle Tennessee, Northern and Central Alabama, and parts of Georgia. The increase of population, as shown by the census of 1890, is remarkable. For instance, the percentage of increase for Hamilton County, Tenn., was 126.22, the gain of the Chattanooga district alone being 51½ per cent. of that of the entire State. Jefferson County, Ala., containing Birmingham, increased 280 per cent. The growth in capital invested is as great, the State of Alabama showing a gain of over 600 per cent. in the investments in its iron and steel industries. The effect of this great influx of population and wealth has been either the building up of old or the founding of new cities and towns. In other words, the development was of the very healthiest character and promised stability of wealth and prosperity until the mad craze for speculation struck the country.

HOW IT WAS BROUGHT ABOUT.

"Then fortunes that for years had been accumulating were withdrawn from legitimate industries and invested in town lots staked off in corn fields, or in some sort of manufacturing business, the prospectus of which was as ephemeral as that of the newly created city. If this had been all, we might by now have fully recovered from the baleful effects of such investments. But the natural result of the inflated values of real estate was a confidence in ourselves and an expansion of the lines of credit to such

an extent that fortunes seemed the creation of a few years at most. Great apparent prosperity in business was the result, and the unlimited personal extravagance of the people kept up for some time this appearance, only to cause the disaster to be the greater when it came. For there had really been no prosperity since industry had left its proper channels. It was merely another case of the consumption of wines, equipages and furniture. The money spent in these destructibles had not employed labor to produce things of ultimate benefit, and the accumulated capital of years of legitimate toil was being rapidly consumed."

EFFECTS OF THE CRISIS.

Mr. Milton furnishes clearing-house statistics which go to show that the Southern cities depending upon agricultural interests suffered least from the craze, and those depending upon manufacturing most. For instance, these statistics indicate an increase of 10.4 in the volume of trade from November, 1892, to November, 1893, for Houston, Texas, the interests of which are largely agricultural, and a decrease of 62.3 in the business of Birmingham, Ala., a manufacturing centre. This Mr. Milton attributes to the greater speculation and the greater apparent prosperity of the manufacturing towns during the period of boom. The capital in these towns was withdrawn from active production and was invested in the production of useless articles, with the result that the people consumed what they had saved from the hardest and most intelligent efforts of the years previous and now, their store of savings having been exhausted, have no fund to support labor.

But the worst effect produced by the "boom" was, says Mr. Milton, the demoralization of labor. "Workingmen have become trained in various pursuits which are finally proved by bitter experience to be fruitless of benefit. The proportion of manual laborers has decreased and legitimate enterprises of reasonable profit have become so unpopular that when the reaction sets in and there is a demand for the products of genuine industry, neither capital nor competent labor is present to produce them.

REBUILD ON THE OLD BASIS.

"Things must now," concludes Mr. Milton, "be shifted back into their normal state. A period of liquidation must be suffered in order to wipe out the effects of unwise investments. The prospective great cities laid off around badly located blast furnaces must come once more under the cultivation of the plow. We must begin again to build on the old solid basis. The schemers, promoters and other useless newcomers must be relegated to the lands from whence they came. When this is accomplished and true production begins once more, we can expect to resume real advance towards wealth and prosperity. Little comparatively has been lost, for much of the apparent shrinkage is a natural decrease from inflated values. Population has actually increased."

Mr. Milton is of opinion that when industry has re-

turned to the proper channels of production the South's recovery will be very rapid—more rapid, in fact, than that of any other part of the country similarly affected.

THE SOUTH CAROLINA LIQUOR LAW.

GOVERNOR TILLMAN, of South Carolina, assures us, in the *North American Review*, that the Dispensary Law recently put in force in that State has not by any means proved a failure. In his own words, "he takes pleasure in assuring the lovers of temperance throughout the land that the dispensary system is a grand success, and that three-fourths of his fellow citizens are so pleased with it that it is safe to say that never again will the bartender in South Carolina sell liquor over the counter, and before the next General Assembly meets the illicit traffic in liquor will almost cease.

HOW THE STATE CARRIES ON THE TRAFFIC.

"The law went into effect on July 1, and on the night of June 30 every bar in the State closed its doors. The work of preparation, organization and arrangements for the control of so mammoth a business had been going on for several months. It is safe to say that no member of the General Assembly, and very few others—certainly not myself—ever conceived the magnitude of the undertaking; and yet, after it has been in operation four months, the ramifications, complications, and ultimate growth of the business are still subjects of conjecture and wonder.

"All of the legal whisky traffic has been turned into one channel, flowing to Columbia, the central distributing depot. Agricultural Hall, a large two-story building with a cellar, thus making three stories, 167 feet by 35 feet, had been turned into a bottling works. It is only a question of time when the erection of much larger quarters on the railroad will be necessary. Fifty-four employees, working 10 hours every day, are kept busy bottling, and we find it almost impossible to keep the local dispensaries in stock, and that, too, when I think it is safe to say that not more than one-half of the liquor being drunk in the State at this time has passed through the Dispensary. Large quantities were purchased in advance, or in anticipation of the law going into effect, by consumers, while there is hardly a train entering the State, day or night, passenger or freight, which does not haul contraband liquor. Some of the railroads are yielding a measure of obedience to the law, but most of them openly defy it or lend their assistance to smuggling liquor into the State."

SOME STATISTICS.

Governor Tillman has had prepared tables covering the operations of the State Dispensary and the County Dispensaries up to October 31, the end of the State fiscal year. These tables show that the gross sales to consumers for the first four months, under all the difficulties and obstacles, have been \$166,643; expenses of State Dispensary \$75,566; expenses of County Dispensaries \$20,054; net profit of State Dis-

dispensary \$32,198, and of the Counties \$20,295. Hitherto under the license system the several counties have derived a revenue of \$100 for each license, aggregating for last year (1893) for the entire State \$81,100, the State itself receiving nothing. "If," says Governor Tillman, "the towns cease their unreasonable and senseless opposition, and three-fourths of the liquor which under any conditions will be consumed in that State shall pass through the Dispensary, the revenue of the towns will not be decreased from what it was formerly, the counties will receive as much, and the State will obtain a revenue equal at least to both of these."

THE CLAIMS OF THE DISPENSARY LAW TO SUPPORT.

The claims of the Dispensary to support are set forth by Governor Tillman as follows :

"1. The element of personal profit is destroyed, thereby removing the incentive to increase the sales.

"2. A pure article is guaranteed, as it is subject to chemical analysis.

"3. The consumer obtains honest measure of standard strength.

"4. Treating is stopped, as the bottles are not opened on the premises.

"5. It is sold only in the day time; this under a regulation of the board, and not under the law.

"6. The concomitants of ice, sugar, lemons, etc., being removed, there is not the same inclination to drink remaining, and the closing of the saloons, especially at night, and the prohibition of its sale by the drink, destroy the enticements and seductions which have caused so many men and boys to be led astray and enter on the downward course.

"7. It is sold only for cash, and there is no longer 'chalking up' for daily drinks against pay-day. The workingman buys his bottle of whisky Saturday night and carries the rest of his wages home.

"8. Gambling-dens, poolrooms, and lewd houses, which have hitherto been run almost invariably in connection with the saloons, which were thus a stimulus to vice, separated from the sale of liquor, have had their patronage reduced to a minimum, and there must necessarily follow a decrease of crime.

"9. The local whisky rings, which have been the curse of every municipality in the State, and have always controlled municipal elections, have been torn up root and branch, and the influence of the bar-keeper as a political manipulator is absolutely destroyed. The police, removed from the control of these debauching elements, will enforce the law against evil-doing with more vigor, and a higher tone and greater purity in all governmental affairs must result."

The consumption of liquor under the old system is estimated at upwards of a million gallons per annum. There were six hundred saloons and four hundred druggists engaged in its sale in 1892. "Under no circumstances," says Governor Tillman, "will the number of Dispensaries ever exceed one hundred and twenty-five, and it is safe to say that the consumption will be reduced forty or fifty per cent."

PUBLIC ARCHITECTURE IN THIS COUNTRY.

MR. MONTGOMERY SCHUYLER introduces his articles "Official Architecture in America," in the *Engineering Magazine*, with the significant statement that "while public architecture in every other country fairly represents the best that the architects can do, in the United States it is very apt to represent the worst." In France, for instance, public architecture is a political function, and the goal of a professional practitioner is appointment to be a government architect. The French architect must prove his ability according to the tests imposed by a professional education, which is itself the care of the State, and also in private practice before he can be so much as considered when there is a question of designing an important public building.

The result is that whatever may be thought of a new public building in Paris or in the provinces, there is never any doubt that it represents what the official hierarchy and the public alike consider the acme of architectural attainment. Throughout the rest of continental Europe the rule is the same.

LOG-ROLLING AND ARCHITECTURE.

During the past quarter of a century the United States has, perhaps, erected more buildings for its own use than the government of any other country in the world. It has, declares Mr. Schuyler, spent more money on architecture and got less architecture for its money than any nation of past or present times. "The waste is appalling when we come to think what might have been done with this money if the standard of official architecture had been kept up to the standard even of the best private building. If we had had a bureau of public works with a succession of able and responsible architects at the head of it, it would have had by this time a tradition of its own that would have been of immense value to the architecture of the country. For the national building in any town is sure to be a conspicuous building. With the system now firmly established in Congress of log-rolling for building appropriations, and of erecting in villages public buildings suitable, in scale and cost, for the cities these villages are expected to become, it is apt to be the most conspicuous building, and the pioneer and model of edifices built of permanent materials. And what models they have been, these public buildings, from the time of Mullett and earlier! With one or two distinguished exceptions, the supervising architects have not been men of high professional standing, although they have been quite as eminent as could have been expected from the conditions of their service. Indeed, the status of the supervising architect is a measure of the legislative, and consequently of the popular, appreciation of architecture. That functionary has the spending of far more money than any private practitioner. He has the supervision of ten times as much work as any conscientious private practitioner would consent to be responsible for. Yet his status is that of a clerk and his compensation such as would not tempt an established practitioner, unless such a prac-

tioner were sustained by professional enthusiasm and willing to make sacrifices for his art. Even so his sacrifice would be vain. A busy architect in private practice has far too little time to devote to the art of architecture. The supervising architect of the treasury, if he discharges the responsibilities his office imposes upon him in other respects, can have none at all.

"There is much to be said about the official architecture of our lesser political divisions,—of States and municipalities. The rule is that no official person cares about it or takes thought for it, and the rule consequently is that it is pretty bad; but the rule is mitigated by occasional exceptions. In any case, and if there were no exceptions, the mischief that is done by the workings of officialism in the architecture of States and municipalities would sink into insignificance compared with the mischief that is done in the architecture of the national government. We are spending enormously and profusely every year to pervert the perceptions of the people of the United States respecting the art of architecture."

THE COST OF CONSTRUCTING AND OPERATING AN ELECTRIC LIGHT PLANT.

AN article by Mr. J. H. Talbot, in the *Engineering Magazine*, contains valuable information for city taxpayers or investors interested in the establishment of small electric light stations. If the facts in this article had been given to the public several years ago without doubt a large waste of capital would have been prevented, and a great many enterprises of this kind now struggling under financial burdens might now be in a prosperous and flourishing condition. Mr. Talbot points out how very difficult it has been for persons desiring to establish an electric light station to obtain in advance accurate and definite information regarding its cost of construction and expense of operation, and it is his purpose in the present article to furnish such information.

Mr. Talbot estimates as follows the cost of construction of a plant suitable for a town of from 5,000 to 10,000 inhabitants—one requiring from fifty to sixty arc lights for public use, and about twelve hundred incandescent lamps for commercial purposes:

Steam plant of 150 horse-power, including foundations, stack, piping, belting, etc.....	\$5,000
Electrical apparatus in station, including arc lamps, instruments, switch boards, etc.	7,000
Arc circuit, complete, to include poles, wire, hanging of lamps, etc., on the basis of, say, 8 miles of wire and 5 miles of pole line.....	2,000
Incandescent circuit, primary, utilizing arc light poles.....	1,000
Converters for 500-light capacity, leaving balance to be purchased as needed....	625
Wiring up, with plain wiring—500 lights—to include lamps and sockets.....	1,250

Total, excluding real estate and buildings.....\$16,875

It is thus found that for a plant of the size sug-

gested, the promoters would have to reckon on an expenditure of capital, paid in cash payments, amounting to about \$17,000, excluding real estate and buildings.

Mr. Talbot next considers the cost of operating such a plant as compared with total earnings. He believes that the following figures may be taken as approximately correct; \$4,250 may be reasonably counted upon as revenue from fifty arc lamps lighted each night from dark until midnight under contract with the city at \$85 per lamp per year, and \$7,300 as revenue from incandescent lighting; or a total revenue of \$11,550. The expense of operating the plant would be, for labor, engineers, firemen and lamp trimmers, \$2,160; fuel, estimated at 750 tons of coal at \$2.75 a ton, \$2,062; for arc lamps and carbons, incandescent lamp renewals, \$1,100; tax and insurance, \$600; collections, bookkeeping and stationery, \$500; repairs, contingencies and sundries, \$560; allowance for depression, $7\frac{1}{2}$ per cent. on \$12,000, \$900, or a total cost of operating plant of \$7,882. Deducting the operating expense from the revenue, it is found that there is an apparent profit of \$3,668. The cost of real estate, of building and of steam power plant depend largely upon local conditions, and no estimates of the items are given by Mr. Talbot.

ELECTRICITY IN SUBURBAN DEVELOPMENT.

DISCUSSING, also in the *Engineering Magazine*, "Electricity in Suburban Development," Mr. Erastus Wiman points out that there are two classes in very many localities in the United States now seriously affected by the hard times, who, while not closely united, could by joining forces materially help each other and promote the general prosperity. These two classes are the owners of suburban property and the owners of electrical plants. The great problem to owners of suburban property is how it is to be rendered accessible, and how in its turn capital can be induced to build railroads and improve the communication sufficiently to bring property into market. The electric light company is already an organization capable of expansion and divisibility, and Mr. Wiman thinks that by enlarging and reconstructing this organization it can be made to include: 1, the light company; 2, the land; and 3, the electric road. Into this company would be merged all the interests to be served, and in its bonds and common stock Mr. Wiman is confident sufficient profit, safety and attraction might be found for capital, not only local but from abroad. An obstacle to the formation of such a company is now to be found in the laws of many States, as that of New York, which while they impart to electric light and power companies the privilege of railroad construction and operation, do not contemplate the acquirement of land, its improvement, sale and lease. Mr. Wiman proposes that such States amend their laws so that the three purposes, the creation of light and power, the construction and operation of an electrical road, and the acquirement and development of suburban property, can be accomplished at one and the same time.

TAMMANY HALL AND NEW YORK CITY.

THE *Atlantic* for February contains a capital article on "Tammany Hall," by Henry Childs Merwin. Not the least entertaining chapter in this recital pertains to the personal history of Mr. Richard Croker, the unofficial but very real "boss" of two millions of people.

"Mr. Croker emigrated to New York from Ireland about forty years ago, being then a small boy. He remained in New York, growing up on the East Side of the city, and while still in his teens he acquired some reputation as a 'tough.' He became identified with what was known as the 'Fourth Avenue Tunnel

MR. RICHARD CROKER.

Gang;' and subsequently he advanced to having a 'gang' of his own. The 'tough' recognizes but one virtue, that of courage, and this young Irishman possessed that virtue in a far higher degree than is the case with most 'toughs.' In 1866 he defeated one Richard Lynch in a fight at Jones' Woods, on a Sunday morning. Afterward, he was matched to fight a well-known professional, Mr. Owney Geoghegan; but this arrangement fell through. At one time Mr. Croker kept a liquor saloon. Later, he served for a short period as stoker to a fire engine. Then he went into politics, holding a small clerkship under Tweed and 'Prince Harry' Genet.

"Mr. Croker is a man of medium height, heavily built, but not portly. He has a massive jaw, a well-shaped head, and though he wears a full beard it is possible to see that he has a mouth which denotes a will of iron. His face is of the bulldog type, but it lacks the good nature which those who are familiar with the really gentle character of the bulldog are able to detect in that animal's countenance. Mr. Croker is reputed to be a man of very few words; that he is extremely sagacious need not be said; that

he has an innate tendency to become respectable is evident from his career. At present he holds no public office whatever, but he governs New York more absolutely than most kings have governed their kingdoms. Though without visible means of support he is a man of great wealth. He has built, or is building, one palace in Heidelberg, another in New York, and he has invested large sums both in running and in trotting stables. How are these facts accounted for? Why is Mr. Croker an autocrat and a millionaire? The answer can be made in a word,—he succeeded John Kelly as Boss of Tammany Hall."

HOW TAMMANY GOVERNS NEW YORK.

Aside from the great general committee of five thousand members, elected annually from the thirty assembly districts into which New York City is divided, which meets every month and prepares the campaign, and besides the committees for the conduct of elections and for finance, the local and detailed work is managed as follows:

"Each assembly district is divided by law into numerous election districts, or, as they are called in some cities, voting precincts—each election district containing about four hundred voters. The election districts are looked after as follows: Every assembly district has a district committee, composed of the members of the General Committee elected from that district, and of certain additional members chosen for the purpose. The district committee appoints in each of the election districts included in that particular assembly district a captain. This man is the local boss. He has from ten to twenty-five aids, and he is responsible for the vote of his election district. There are about eleven hundred election districts in New York, and consequently there are about eleven hundred captains, or local bosses, each one being responsible to the (Assembly) district committee by which he was appointed. Every captain is held to a strict account. If the Tammany vote in his election district falls off without due cause he is forthwith removed and another appointed in his place. Usually the captain is an actual resident in his district; but occasionally, being selected from a distant part of the city, he acquires a fictitious residence in the district. Very frequently the captain is a liquor dealer, who has a *clientele* of customers, dependents and hangers-on whom he 'swings' or controls. He is paid, of course, for his services; he has some money to distribute and a little patronage, such as places in the street-cleaning department or perhaps a minor clerkship. The captain of a district has a personal acquaintance with all its voters; and on the eve of an election he is able to tell how every man in his district is going to vote. He makes his report; and from the eleven hundred reports of the election district captains the Tammany leaders can predict with accuracy what will be the vote of the city."

NO RESPECTER OF NATIONALITIES.

Tammany is not, as is generally supposed, almost exclusively Hibernian in membership. "Some of its

election district captains are Jews, and although most of the assembly district leaders are Irishmen, there are almost as many Germans as Irish in the rank and file. Tammany, again, is always on the alert to placate and promote men who have influence or ability. If there be, for example, an Italian in the district who shows some independence of character and has a following, however small, among his countrymen, Tammany will grapple that man to itself with hooks of steel. He will get money or a place; he will get something, or at least the promise of something.

"Tammany is very hospitable to rising talent, and it bears no grudges. It receives a convert with open arms and rewards him in proportion to the harm which he did to the organization in his unregenerate days. Young men find that Tammany is ready to advance them as fast as their capabilities will permit."

THE RESULTS OF SUCH A SYSTEM.

While Mr. Merwin has a great deal to say, naturally, about the petty despotism that Tammany exercises over the least and the greatest of New Yorkers, he is rather surprised at the net result of effective and economical government that, in his opinion, comes to the city from such an absurdly illogical system. "It is commonly conceded that in most respects the city is well governed. It is orderly; the criminal class is well kept under; the fire department is exceedingly good; the police are extremely efficient, though often brutal and oppressive in their treatment of persons without money or influence; the streets are well paved, and not very dirty. School teachers are appointed regardless of politics. Finally, the cost of the city government is not excessive. The tax rate is \$1.85 per hundred, and the valuation is low, being calculated at forty, or possibly fifty per cent. . . . Furthermore, so far as is known, no frauds are committed upon the taxpayers outright, such as were perpetrated in the days of Tweed. Tammany raises immense sums, but they are raised by contribution and by blackmail, not by theft. In short, the results are astonishingly good, considering the character of the persons who are now at the head of Tammany Hall; and the inference is that the rank and file of Tammany Hall, including most of the office holders, are sound, honest men. As was remarked to me recently by a prominent lawyer, familiar with city politics, 'If a reform movement should be made successfully here in New York, and an anti-Tammany machine be organized, the rank and file would remain substantially the same, the leaders only would be changed.'"

THE DARK SIDE.

On the other hand, some of the appointments, especially those important ones to the judicial bench, are atrocious. The anti-Tammany daily papers have made us acquainted with many a representative case of this. Then the blackmail schemes by which the ring raises so large a proportion of its revenues are pointed to by Mr. Merwin as another blot on the government of the metropolis. This is not confined to

the smaller bribery from and intimidation of city property holders.

THE PART IT PLAYS AT ALBANY.

"There is another way, also, in which Tammany, or rather the State 'ring,' of which Tammany forms the chief part, is interested in Albany legislation. For many years the 'striking' of individuals, and more especially of corporations, has been a recognized industry at Albany, as indeed it has been, though to a less extent, in most State capitals. A legislator 'strikes' a corporation, as I have indicated, when he introduces some bill calculated to injure it directly or indirectly; his purpose being, not to have the bill pass, but to compel the corporation to buy him off. Sometimes, also, corporations are forced to pay large sums for particular legislation which they desire, which may be, and often is, perfectly proper, and which a legislature not venal would grant without difficulty. It is generally believed that enormous sums pass into the ring's hands in this way. I know of one case where twenty-five hundred dollars were paid by a corporation for a small piece of legislation. I know of another case where fifteen thousand dollars were demanded for a similar but more important service. After much deliberation, and under the advice of able counsel, it was concluded to pay this sum, and nothing remained to be done except to send the check; but at that stage of the negotiations the election of last November occurred. Tammany lost its majority in the legislature, and I presume, though I do not know, that the check was not sent. In still another case, Tammany demanded of a corporation doing an immense business in the State sixty thousand dollars for some entirely proper legislation at Albany. The company was advised by its counsel, an eminent member of the bar, to hand over the money. But here, again, the election of last November intervened, and caused, I believe, a hitch in the proceedings. These large payments are not made by shady individuals or companies doing a doubtful business and advised by shyster attorneys; they are made by the chief corporations in the State, acting under advice of the chief lawyers in the State. Last year, Tammany being in full possession of the legislature, this blackmailing business was thrown directly into the hands of the ring, and the result was described by the president of a great insurance company doing business in New York. 'Formerly,' he said, 'we had to keep a man at Albany to buy off the "strikers" one by one, but this year we simply paid over a lump sum to the ring and they looked after our interests.'"

Mr. Merwin concludes this valuable paper with this paragraph:

"But even if it were extremely good, even if it did not involve blackmail and oppression, it is not the sort of government which we are supposed to tolerate in this country. Did we rebel against England, have we declared constitutions, made laws, organized a nation, in order that Mr. Richard Croker, or his successor in the office of Tammany Boss, might put his foot on our necks and keep it there? That is the question which confronts the citizens of New York."

"POLITICAL REUNION FROM A CANADIAN POINT OF VIEW."

MR. W. SANFORD EVANS, in the *American Journal of Politics*, writes on "Political Union," from what he calls a Canadian point of view. The greater part of his article is taken up in answering some of the claims for political reunion between the United States and Canada which have been presented in recent magazine articles, by Professor Goldwin Smith and Hon. Francis Wayland Glen. He adds to the controversy, however, some fresh facts, the most striking of which is, perhaps, that since 1760, when Canada became a British possession, its population, even allowing for the emigration across the line, has increased eighty fold, while that of the United States has increased only twenty-one fold. Furthermore, he states that Canada has greater and more valuable public works than the United States, has more miles of railroad, an export trade fifty per cent. greater, a mercantile marine six times as great, more respect for law, less crime and less destitution. He states, also, that in seventeen years the deposits in the Canadian banks have increased from \$17,000,000 to \$223,000,000.

"What would Canada gain, then," he concludes, "by uniting with a nation which, in proportion to population, is not so prosperous or progressive as herself? 'She would get more capital.' Yes; but the capital will come whether she unites or not, and, in any case, she would as soon have European capital as American. If United States capital was not able to support home industries when a large amount of European capital was withdrawn during the past year, we would just as soon get our capital when it can be better spared; although we will welcome any attempt to develop our resources.

THE CANADIAN FORM OF GOVERNMENT PREFERABLE.

"We could share in the American form of government.' The first thing that strikes a Canadian in this connection is that any representatives we would be allowed to send to Washington would be so hopelessly in the minority that we would be exchanging a condition of almost perfect freedom and self-government for one of helpless subjection to a parliamentary majority. Besides, with the exception of the universally attractive idea of independence, the American form of government has no attractions for a Canadian. We are firmly convinced that our own form of government is better throughout. But more than this, we believe that all government is yet in the experimental stage, and that nowhere has there been found that form which will best suit the development of man, and will foster what is noble while it represses all unworthiness, and will deal absolute justice between class and class. There is an ideal of government toward which the world is working, and which, we hope, Canada will first formulate and carry out.

"But if we united we would form the greatest empire in the world, and there would be removed forever the fear of war.' Unfortunately the teaching of reason and of experience, as shown in the pages of

history, is that great empires are grand mistakes. Individualization in nations is as essential to the progress of the world as the development of personality in individuals. 'But the fear of war would be removed.' He who talks of or threatens war should be indicted of high treason before the court of the developed conscience of this Western World.

"There remains something better for the United States and Canada than political union, and that is to live side by side, learning from one another and adding to each other that stimulus which shall call forth the best from each, and withal in perfect friendship, so that the world may be taught what true progress is and what should be the relationship between nations from the example of Uncle Sam and his cousin on the North."

THE HAWAIIAN DIFFICULTY.

BY far the coolest and most discriminating presentation of the Hawaiian situation that has yet appeared in the magazines is Dr. Theodore S. Woolsey's article, "The Law and the Policy for Hawaii," in the *Yale Review*. Dr. Woolsey first clears the way by setting forth the policy which the United States has adopted with reference to unstable Central and South American governments. As a result of the frequent political changes in the Latin Americas the United States has been led to accurately define its diplomatic position in view of them and lay down rules for the recognition of new governments. Its usage in this regard Mr. Woolsey considers settled. He finds it clearly stated in a dispatch of Secretary Livingston's to Sir Charles Vaughn, April 30, 1833: "It is the principle and the invariable practice of the United States to recognize that as the legal government of another nation which by its establishment in the actual exercise of political power might be supposed to have received the express or implied assent of the people." Several instances are cited in which this statement has since been endorsed; among others, in President Hayes' first annual message in 1877, and in President Arthur's third annual message in 1883.

OUR RECOGNITION PREMATURE.

The rule that a revolutionary government is not to be recognized until it appears that it has the approval of the people in the State it pretends to govern, represents, continues Dr. Woolsey, not only the usage of this country, in the manner of recognition, but it is also in accord with the principle of international law. "All States are equal. Each State may determine its own form of government, may change it at will. The government *de facto* is the government *de jure*. That is a government *de facto* which is capable of insisting on the rights and fulfilling the duties of its State. Such capacity will spring from the undoubted expression of the will of the people. Recognition, before proof of such popular backing is furnished, is premature. It assumes a fact which is not yet manifest. With these simple, well established rules in mind, we are in a position to judge of the propriety of the early diplomatic moves in the

Hawaiian question now confronting us. The position of a queen in the Hawaiian Islands is as legal as that of an emperor in Russia. The personal character of that queen does not affect the legality of her government. A change of the constitution under which she governs is an internal question solely. Early in the present year there occurred a revolutionary outbreak in Honolulu. A new government was set up, calling itself provisional. What was the attitude of the United States towards it? Was its traditional usage observed? On the contrary, amidst the conflicting statements of fact, we can at least make sure of this. Before the people of Oahu had a chance to pronounce upon their desire for the change, before the other islands could even hear of it, before the new *régime* could demonstrate its capacity for fulfilling the obligations of the State, before it had gained possession of all the government buildings, and proved its power, its recognition was granted by the United States. This action was premature; it was contrary to our usage in similar cases; it was in the highest degree improper. That it was soon followed by similar recognition by the representatives of the other States which maintain diplomatic relations with Hawaii does not excuse it. For, in the first place, our recognition unquestionably gave the new government a standing which it might not otherwise have had, and, again, recognition by one State is apt to be speedily followed by the recognition of other States, lest they suffer in influence with the new government. Emphatically it is the first step which counts."

Dr. Woolsey makes no mention of the charges that the avowed sympathies of the Minister of the United States, and the landing of marines to preserve order, assisted in effecting this revolution, nor does he enter into the questions of veracity raised by Mr. Blount's reports and Mr. Stevens' denials. These charges and refutations he regards as of incidental importance compared to what he calls "the hasty recognition of the Provisional Government by the United States."

ONCE RECOGNIZED, IT IS A SOVEREIGN STATE.

As to the second act in the little drama, Dr. Woolsey says: "Here we find a sovereign and independent State, calling itself a provisional government, that is, organized provisionally to secure certain objects. What these objects were is best stated in the proclamation of the revolutionary committee, issued January 16, 1893. 'The Hawaiian monarchical system of government is hereby abrogated. Provisional government for the control and management of public affairs and the protection of public peace is hereby established, to exist until terms of union with the United States of America have been negotiated and agreed upon.' What is the status of this government in the eye of international law? Does its provisional character make it any the less a sovereign State? Granting that its origin was owing to a wrongful act on the part of the United States, is its subsequent legality impaired? Both of these questions must be answered in the negative. The intervention of France

in our Revolutionary War was technically illegal, was an act of war, but the recognition of the United States was not thereby invalidated. Our recognition of Texan independence was wrong, in being likewise premature, but no one questioned the legality of the Texan status. Not only our recognition of the new government in Hawaii, not only its recognition by other States, but also every subsequent act proves its sovereignty. We have accredited a minister to it, we have received a minister from it. Nor does its avowed provisional character alter our duties or its rights. If a government is organized to secure certain objects, who shall decide when and whether those objects are achieved or are impossible, or what other objects shall succeed them? Is the dictum that the objects for which this provisional government was formed have proved nugatory, and that, therefore, *ipso facto* it has lapsed, and the former government reverts, one which it is competent for any other than itself to pronounce? Surely not, otherwise its sovereignty would be a very qualified article. What this new government shall do with its own, what it shall develop into, whether it shall withdraw in favor of the deposed queen, or form itself into a permanent republic is a matter purely for internal decision."

Dr. Woolsey points out that the recognition of a provisional government is no new thing. It was made in the case of Costa Rica in 1868; the National Defense Committee was organized in 1870 as the government of France, and the Calderon government was recognized in 1881 as the "Existing Provisional Government" of Peru.

OUR DUTY IS SIMPLE—HANDS OFF!

"When we ask, then, what should be our attitude towards the Provisional Government of Hawaii, if we observe our own usage and the rules of international law, there can be but one answer. Its rights are the same, our relations to it are the same as in the case of its predecessor. To restore the queen by intervention would be a fresh wrong. Any forcible interference in the affairs of Hawaii, even to insist on a plebiscite whose result should determine in whose hands the government shall reside, would be illegal. For Hawaii is a sovereign State. One wrong cannot be cured by another. Our duty is simple. It consists in keeping our hands off."

Dr. Woolsey then considers the policy which should be adopted toward the islands, concluding that since neither party in Hawaii seems hostile to the interests of this country, and that we have the treaty of 1875 to fall back upon if our interests are threatened, and the Monroe Doctrine to appeal to if the treaty should be abrogated, we should pursue the same policy toward Hawaii as existed down until the overthrow of the monarchy and in fact still exists.

Annexation of the Hawaiian Islands does not seem to him to promise material advantage, and he is inclined to think that the profit this country would reap from annexation would be far from commensurate with the responsibilities and burdens it must assume. He goes so far as to say that the real and only

advantage from annexation would be gained by the islands themselves, and adds that in a question of State policy we must consider our own interests, not those of others.

An Historian's Review of the Revolution.

In the *Forum*, Mr. James Schouler, the well-known American historian, undertakes to present "without bias or direct suggestion" a succinct review of the three days revolution of January, 1893, at the Hawaiian Islands, which resulted in the dethronement of Queen Liliuokalani and the establishment of the Provisional Government. Mr. Schouler's conclusions support the position taken by the present Administration and are based not merely upon Mr. Blount's report or Secretary Gresham's briefer synopsis of the revolutionary incidents leading up to the overthrow of the Hawaiian monarchy, "but," he says, "as if investigators so tried and so able, and so honorable, as these might not be trusted upon their own sifting of the evidence, I have gone searchingly through the whole mass of accompanying testimony for my own satisfaction, with all the individual counter-statements which have appeared since its publication, as well as our leading press comments, lying by me for comparison; and my only surprise is that a candid and unprejudiced mind can reach, on the essential facts, any deduction materially different from their own."

MR. BLOUNT'S TESTIMONY NOT "EX PARTE."

"For," continues Mr. Schouler, "this testimony is not *ex parte* in reality, as so many have taken for granted, but Commissioner Blount pursued his delicate mission with rare discretion, and with an evident determination to reach the bottom of the truth; he avoided, for the independence of his search, all insidious attentions which were offered him on either side; and it appears painfully clear that from the moment the chief participants in the Queen's dethronement and the present Provisional Government discovered that his purpose was not to make up a vindication for them, their witnesses avoided him, did not volunteer information, became unwilling to testify, while our legation archives, more deficient in written letters and memoranda than they ought to have been, proved difficult of access. Those chiefly compromised by Blount's report have, moreover, differed with it in their various explanations, not so much on the facts as in the deduction from facts. . . . The main purpose of Blount's mission, properly considered, was not to explore the moralities of other nations that have not undertaken to explore ours, but to find out whether in actual truth the present government, *de facto*, never authoritatively sanctioned, was *bona fide* established by local revolution, or, on the other hand, by fraud, or at least a misuse of colorable protection under the American flag, which neither the law of nations nor a self-respecting public neutrality can warrant. Minister Stevens, in his latest printed explanation, embraced most leading opponents of the revolution whom the commissioner met at Honolulu in something like a wholesale bill of attainder, but reflection should con-

vince us that even immoral persons may be credible to some extent, and especially ministers of state who are backed by official documents."

THE HARRISON ADMINISTRATION DECEIVED.

Mr. Schouler sums up his review of the Hawaiian situation as follows: "Thus, then, was acquired by American sojourners, after less than a three days' conjoint rebellion, and without the loss of a single life or the firing of a gun, what Mr. Stevens, most loath to lose it, has lately described not inaptly as a 'territorial and maritime prize' for the American people. And if his own official dispatch which announced the new situation veered rather wide of the truth, the statement of the five Hawaiian commissioners, who were next hurried off to Washington to negotiate an alliance treaty, must be pronounced a positive falsehood. The Harrison Administration had been plainly deceived in this whole *de facto* business, as the statements of two, at least, of its Cabinet tacitly, if not positively, admit; and the American people must confess with shame that the national honor endures a new stain, a new reproach of national greed, in the wrong so recently done to the gentle Hawaiian people, to their constituted ministers, and only less positively to Queen Liliuokalani in person. That the insurgents were prematurely recognized to say the least, and put in use of that formidable weapon to accomplish what they must needs have accomplished somehow to become a government *de facto* at all, is now so evident that their defenders have fallen back together upon the plea—utterly inadmissible and unwarranted by the facts—that the Queen's government had practically ended on the Saturday previous, and by an act on her own part which never went beyond a mental intention before she yielded to her constitutional advisers and to the public expression, and relinquished the ill-conceived purpose.

OUR NATIONAL EXECUTIVE'S RIGHT AND DUTY.

"Our national Executive has now the clear right and duty under all the circumstances, unless constrained by Congress, to decide what our national vindication requires before the world, and to enforce that vindication besides. Either of two grounds may be taken for such action: one ground, which Secretary Gresham has already put forward, and international comity asks, in case of unwarranted interference by one nation in the affairs of another, that the injured sovereignty shall be placed as nearly as possible *in statu quo*; and the other ground, which is justified by the peculiar facts of the present case, that two rival organizations in a conflict for domestic sovereignty referred mutually the question of rightful status and supremacy, rather than have bloodshed, to this foreign American republic, already involved to some extent in their dispute, agreeing at the same time substantially and mutually to abide by its award and final adjustment.

"In proof of this latter postulate are, the conditional character of the Queen's abdication as accepted by

the provisional contestants: and furthermore the creation of their own Provisional Government, not as one full and permanent, but as a mere temporary establishment having no distinct sanction from the Hawaiian people beyond such conditional abdication, a government "to exist until terms of union with the United States of America have been negotiated and agreed upon,"—words which do not naturally import continuous existence if we now decline such union, but rather the reverse. For if this revolutionary establishment had counted upon the cupidity of our American people, that of constitutional monarchy hoped for a generous sense of justice. Such a compact of reference and arbitration was entered into when all contracting parties knew that Mr. Cleveland had just been elected President, and that the case could not fairly be heard until his induction into office. His Administration has since investigated the facts with all reasonable diligence and honesty of purpose; and, having investigated and decided, enforcement of the decision comes next in order, so far as international justice is concerned, aside from mere prudential considerations."

THE REPUBLICS OF THE WORLD.

HOW each of the various republics of the world is governed is concisely described by Mr. James Douglas, in the *Missionary Review of the World*.

FRANCE.

The fundamental laws of the United States are familiar to all of us. Of the republican governments, next to our own ranks that of France, which is governed by a President, Senate and Chamber of Deputies. "The President is elected by the Senate and Chamber of Deputies for seven years. He concludes treaties with foreign powers, but requires the assent of both Chambers to declare war. The Chamber of Deputies now consists of 584 members, who have been elected from as many *arrondissements* on the basis of universal suffrage. All bills are first canvassed in committee before being introduced into either House, and may be introduced either by the ministry, or by the President through the ministry, or by private members. The Senate is composed of 300 members, elected for nine years by an electoral body composed of municipal councils, deputies, councillors-general, and district councillors. The Senate has the right, as well as the Chamber of Deputies, of initiating and framing laws; but all laws relating to finance must first be presented to and voted by the Chamber of Deputies. The Senate acts as a Court of High Treason, before which even the President and ministers may be arraigned. The ministry is appointed by the President, and forms a council of ten ministers who hold the varied portfolios of office. In addition there is a *Conseil d'Etat*, introduced by Napoleon I, and still existing, whose functions are consultative only.

MEXICO AND CENTRAL AMERICA.

"The republic of Mexico comprises the richest and most varied zone in the world. The area is about

half the size of European Russia and the population about half that of England. It is divided into 27 States, two territories and the federality of Mexico—in all 30 political provinces. The government has the usual threefold basis—President, elected for eight years, a Senate of 60 members, and a House of Representatives, elected by universal suffrage. Each State elects two members to the Senate, and, as in the United States, has autonomous local government. All sects are tolerated in Mexico, and none is aided by the republic or allowed to acquire land. Primary education is provided and is compulsory; there are 10,000 schools.

"Since 1859 the long, irregular isthmus connecting North and South America, and formerly constituting the Spanish colony or kingdom of Guatemala, has been divided into five independent republics, of which three—Costa Rica, Nicaragua and Salvador—are governed in the normal manner, by a President, an Upper House and Lower House; while the other two States, Guatemala and Honduras, present the anomalous *régime* of a President and Congress only.

COLOMBIA, VENEZUELA AND ECUADOR.

"The republic of Colombia, formerly known as the United States of New Granada, is chiefly noteworthy as being intersected by the ill-fated Panama Canal, *the dearest ditch ever delved*. The governing body consists of three orders—a President, elected for six years, a Senate of 27 members and a House of Representatives of 66 members.

"Venezuela has a similar constitution; but Ecuador can hardly be said *to be governed*, as civil wars and revolutions are almost always in progress. Even its area is uncertain, as there are chronic boundary disputes between Ecuador and Peru; but the size is about equal to that of the United Kingdom of England and Scotland. It contains the highest peaks in the Andes chain and the sources of the Amazon.

BRAZIL.

"Nearly four years ago the bloodless revolution which drove the gentle, learned, and invertebrate Emperor Dom Pedro II from his throne removed the last crowned monarch from the Americas, which now, with the exception of Canada and certain West India islands owing a certain measure of suzerainty to European powers, are under republican sway. Under the new *régime* Brazil is divided into immense provinces with few common interests, and separated by undeveloped regions. These provinces are each governed by a provincial assembly, and the several assemblies unite to elect a Chamber of Deputies, or Constituent Assembly, which has at its head a President, elected for four years.

"Ever since the old Emperor was dethroned Brazil has been in a seething state of disaffection and incipient revolt, due generally to the desire of the southern provinces to establish their independence. Just now this has culminated in the throes of revolution, and will probably lead to the disruption of Brazil into several mutually antagonistic States. While the present outbreak is in progress no more

detailed information transpires than that life, property and funds are alike insecure, and that it would be unwise to choose Brazil as a field for emigration. The States have shaken off the established religion, which was Roman Catholic; education has been secularized; and only civil marriages are recognized. Brazil has the enormous area of 3,250,000 square miles—as large as all Europe, Russia excluded—and a population less than half that of Europe.

PERU AND CHILI.

“Peru has a constitution modeled on that of the United States, but religious liberty is not permitted, only the Roman Catholics being allowed to hold their services publicly. Since the disastrous war with Chili, the great encomiums formerly lavished upon its capabilities, mines and climate have been discounted. The population is about the same as that of Scotland, but the area is equal to that of the United Kingdom, France and the Spanish Peninsula combined.

“Chili is a long, narrow strip of land between the Andes and the South Pacific, divided into 21 provinces and three territories. These elect a Lower Chamber of Deputies of 109 members triennially, the electors being confined to men with a property qualification, and an Upper House, or Senate, of thirty-seven members, elected directly by the provinces every six years. The executive power is in the hands of a President, elected for five years. The Roman Catholic religion is the State religion, but all others are tolerated. Education is free, compulsory and universal.

BOLIVIA, PARAGUAY AND URUGUAY.

“Bolivia, a sparsely peopled inland State, shut in by the Andes and the Cordilleras, in Central South America, is ruled by a President with two legislative chambers, elected by universal suffrage.

“Paraguay, an inland territory, for which is claimed the title of ‘Garden of South America,’ has an area of one-fifth of that of Great Britain, and a population smaller than Manchester. It is governed on the usual threefold plan. The State religion is Roman Catholic, but all others are tolerated. A metal currency has been introduced, and now that the government is settled and territorial wars have ceased the prospects are bright.

“Uruguay is a small republic on the east coast of the La Plata River, with an area a little larger than that of England and Wales and a population equal to that of Glasgow. The government is of the normal order, modeled largely after the United States. Education is general and the State religion Roman Catholic, but all others are tolerated.

ARGENTINE REPUBLIC.

“The Argentine Republic is a vast cave of Adulam, whither every one that is in debt and every one that is discontented have gathered themselves. It is a bankrupt republic, with which the British government will not even exchange money orders, and which refuses to extradite fugitive thieves so long as their money is not all spent. At the present time of

writing this republic, having President, Senate and House of Deputies, is in its chronic state of rebellion against its President, who was, according to government statements, crushing out the last embers of disaffection; but, if we may believe the insurgents’ statements, was deserted by all, and had abandoned the reins of power to his adversaries. Argentina has a population of 4,000,000, sprinkled over an area nine times as large as Great Britain.

HAYTI.

“The island of Hayti, the largest but one of those forming the West Indies, is divided into two republics—the Spanish mulatto one of San Domingo and the negro one of Hayti. This island, which was the first European settlement in America, is the most fertile and the worst governed spot in the Caribbean Sea. San Domingo, the larger republic, is governed by a President and national Congress; but in the smaller republic of Hayti, the government being military, the President has large sway. He is assisted by a Senate and House of Representatives. The debt is heavy and more or less repudiated. The currency is chiefly paper. Numerous revolutions have occurred, and the political barometer is set at *stormy*.

SWITZERLAND.

“The far-famed and historic republic of Switzerland has a parliament of two Chambers, the State Council and National Council, in which are vested the supreme legislative and executive authority. The first is composed of 44 members, chosen by the 22 cantons of the confederation, two for each canton. The second consists of 147 representatives, chosen in direct election, at the rate of one deputy for every 20,000 souls. A general election takes place every three years; any voter, if not a clergyman, may be a deputy; and every citizen has a vote who has attained the age of twenty years. The two Chambers constitute the Federal Assembly, which elects a Federal Council of seven members, the President and the Vice-President of which are the first magistrates of the republic. In no country is the will of the people so directly felt and so emphatically law as in Switzerland. Frequently the first step to legislation is taken by the popular initiative; and besides, the principle of what is called *referendum* is often acted upon, whereby on a petition from 50,000 citizens, or eight cantons, the measure passed at headquarters must be submitted to the direct vote of the nation.

ORANGE FREE STATE AND ANDORRA.

“The Orange Free State republic, in South Africa, has a President, elected for five years, a small Executive Council and a popular Assembly, of 57 members. The right to vote is restricted to white burghers who are owners of property.

The miniature republic of Andorra, in the Pyrenees, the entire population of which might be seated in the Metropolitan Tabernacle, London, is governed by a council of twenty-four, chosen by the inhabitants, a judge and two priests. This is subject to France and Spain.”

AN ADVOCATE OF PROPORTIONAL REPRESENTATION.

IN the February *New England Magazine* Mr. W. D. McCrackan argues energetically for proportional representation in this country. He holds up to condemnation the evident solecisms of the unproportional system, and tells of the discussion by the advocates of the better system who met at the World's Fair. These gentlemen came from States as far removed as Massachusetts and California, Illinois and Maryland. A national league was formed to educate and agitate. It was decided to advocate either of two methods, the Hare system or the Swiss Free-List. During the session of this congress a practical test of the Hare system was made with the audience as voters. It was like a parlor game, which any child could have understood.

"The audience was supposed to be a constituency with six representatives to elect. Ballots were distributed containing twelve names. The voters were asked to mark six of these names in the order of their preference. The total number of ballots was ascertained, then divided by six to give the electoral quota, and the first six candidates who had received this number were declared elected.

"The unused votes of the first choice were transferred to the second choice, and so on, until the necessary six candidates were elected.

"But as this system practically disregards party organizations, and might, therefore, encounter greater oppositions, it was decided to advocate also the system of the Free List, as now working in three cantons of Switzerland—Ticino, Neuchâtel and Geneva.

"A bill was prepared, the main features of which were the following:

"That the members of the House of Representatives shall be voted for at large in their respective States.

"Each elector has as many votes as there are representatives to be elected, which he may distribute as he pleases among the candidates, giving not more than one vote to any one candidate.

"The votes given to candidates shall count individually for the candidates as well as for the tickets to which the candidates belong.

"The sum of all the votes cast in any State shall be divided by the number of seats to which each State is entitled.

"In Switzerland, proportional representation has taken firm root. M. Louis Ruchonnet, one of the foremost statesmen of the little Republic and an ex-President, assured the writer that this reform was bound to sweep the country. He himself had been instrumental in having it introduced into Canton Ticino.

"It is now generally conceded that our own rebellion was forced upon the Union by a minority of the Southern people. The records of elections and the proceedings of legislatures in the Confederate States previous to 1860 show conclusively that the majority were not in favor of war. Unfortunately, a faulty electoral system prevented the voice of the Southern

peace majority from being heard at Washington. It is worth considering whether this country is not now incurring grave dangers in disregarding the just demands of the industrial classes for representation. It were far better to have the most foolish schemes under the sun proposed and discussed than to embitter a large minority by a conspiracy of silence."

A Bill to Establish the Referendum in England.

"An appeal to the Lords" is advanced in the *National Review* by Mr. St. Loe Strachey, who describes himself as "a Democrat and a Unionist." He asks: "Why should not some Peer of standing and ability introduce a bill establishing the Referendum as one of our institutions? and that done, why should not the House of Lords pass the bill and send it down to the Commons? Such action on the part of the House of Lords would leave no doubt in men's minds as to the acceptance of the popular sovereignty by the Lords.

"If the Commons passed the measure, no more need, of course, be said. Both Houses would have vindicated their trust in the people. If, however, the Commons evaded the issue by refusing to discuss the bill, or otherwise disposed of it, then the electors would clearly know how to value the claim of the Gladstonians to be the true Democratic party."

ON THE INITIATIVE OF EITHER HOUSE.

His suggestions for a bill, which, he thinks, need be only "a couple of pages," are these: "The bill would lay down that if and when the two Houses could not agree as to the provisions of a bill, either House might, in passing the bill in the form desired by the other House, insert without further debate or conference a proviso that before being submitted for the royal assent the bill should be referred to the electors of the United Kingdom—a poll of the people being taken in the manner prescribed by the act. The prescribed manner would naturally follow the lines of parliamentary elections." The ballot paper should ask simply a mark in a column headed Yes or No, according as the voter did or did not approve the measure referred to him. The measure should be posted up inside and out of the polling booth.

OR ON THE INITIATIVE OF THE PEOPLE.

The general count should be supervised by the Speaker of the Commons and by the Chairman of Committees in the Lords, and in case of a tie the decision should be taken as against the bill. Mr. Strachey somewhat hesitatingly concedes that "it might be enacted that there should be an interval of a month between the passage of a bill through parliament and the royal assent, and that if during this time a certain number of electors petitioned the crown to issue writs for a poll of the people, a poll should be held."

Mr. Strachey is convinced that "the Referendum would make it impossible for the Union ever to be dissolved. Home Rule is only possible by means of a log-rolling agreement between the Gladstonian sub-

parties and the Irish, and no Home Rule bill would ever stand the test of a poll of the people."

IS REPRESENTATIVE GOVERNMENT A FAILURE?

"IS Representative Government a Failure?" is the question which Mr. Auberon Herbert propounds in the *New Review*, "Is the hope of our century an illusion?" he asks. His answer is not reassuring. The representative idea by which men once believed social existence was to be recreated and happiness finally secured, is, he declares, "dead; dead, past praying for, dead as a door nail." "It can clear the ground of obstruction; it has in itself no powers of construction." Of this lamentable disappointment he catalogues the reasons!

"TWO PAIRS OF SHOES FOR ALL THE NATION."

1. A body of men cannot in any true sense be represented by one man. Agreement to be represented by one man is secured only by self-effacement; and it is external and superficial agreement at the best. How different are the educational questions men note and agitate about from those of the inner meaning, method and aims of education.

"In all such self-effacement there is deep national loss. Under the true democratic creed no man should be self-effaced, no man should be sacrificed to machinery. Under our system four out of every five men are self-effaced and sacrificed. It is the penalty of constructing two pairs of shoes for all the nation and declaring that everybody must find his fit in one or the other.

THE TYRANNY OF MACHINERY.

"2. The second great defect inseparable from representation is that it forces organization from a secondary and inferior position into the first and dominant position. . . . We have been learning far too much to shape our opinions to give effect to our organizations, instead of shaping our organizations to give effect to our opinions. . . . Under a representative system organization is an essential part, from which there is no escape . . . and this machinery not only has the effect of compounding us into an untrue artificial whole, which is a very coarse and poor expression of the various forms of life and thought which make up the real whole, but it specifically fails in its own work and does not "represent" in the narrowest sense of the word. There are signs that this truth is now felt in the political world itself, and the next great change is likely to be the decision of questions by the direct public vote instead of by a House of Representatives."

DELEGATE OR GOD-ELECT?

3. What is the representative? A delegate? Then he is a bit of badly constructed machinery, so many incoherent mandates being mixed up in him. If he is not a delegate, then we have a democratic imitation *in petto* of the divine right of kings.

4. How are we to discover the right little god-elect?

"At present the method is, selection of the man

who professes those opinions which find most favor, and who can most skillfully express them on a platform. Can this method yield satisfactory results? . . . Is it not quite certain that in many cases what is required will be professed? But will men who profess for the sake of their own advantage make good little gods-elect? . . . And yet under our system we almost force insincerity upon our representatives."

DEMORALIZATION EVERYWHERE.

5. Government must be carried on by two large parties or by groups of small sections. Both systems present hopeless difficulties. The second is more true to human nature, but makes continuity difficult.

6. The hopeless burden of work flung on the representative which is not to be staved off by devolution or decentralization, results in "demoralization everywhere"—to the government, to the representative individual.

The system is wrong in theory, says Mr. Herbert, for a few men cannot represent many men; it breaks down in practice, for "there is no possible way in which the people can control the huge machinery which is to control on their behalf all the complicated affairs of life."

"A SORT OF POLITICAL INFLUENZA."

What then is the remedy? Ask, first, what is the root of the malady? "The value of representation to us has been that it has allowed us to continue to play the great game of power without actually breaking each other's heads; it has been for us—compulsion made easy. But now comes the big question: is this fighting life of ours, for which we have thus used representation, good in itself? Is this compulsion of each other a true relation for reasonable human beings?"

The article ends with the cheery belief "that this present mania for compulsion of all kinds is merely a temporary mental ailment through which we are passing—a sort of political influenza—and that with returning health we shall shake off these sick fancies and discover a robuster and happier faith, believing once more in universal manhood and not in universal babydom."

SIR DOUGLAS GALTON contributes to the *Nineteenth Century* several interesting particulars from the investigations instituted by Dr. Francis Warner concerning feeble-minded children. Dr. Warner "has now reported on over 80,000 children seen individually by him in 148 schools, having taken notes of all cases presenting any visible defect—i. e., 14,297 children." It appears that in all groups of schools a larger proportion of boys than girls deviate from the normal. When, however, we take boys and girls presenting no defect in development, we find the proportion who are delicate equal in the sexes. The subclass "small heads" forms 3.4 per cent. among English girls, as compared with 1.3 for boys. This condition appears more commonly among the children of large block dwellings and warehouses.

EUROPE A FEDERATION OR A WRECK?

The Dilemma Offered by American Rivalry.

AMERICAN competition is the very demon of the British agriculturist. It is the bogie which haunts the brain of the British merchant as he dreams of the days when American protectionism is dead. It is yet apparently to become the angel of peace whose power will scatter forever the war cloud now lowering over Europe. Such is the outlook presented by Mr. Charles Roberts, M.A., in his article on "European Militarism and an Alternative," in the (English) *Economic Review*. The recent naval agitation convinces him that "England is helplessly drifting into the European competition in military armaments."

To show what that competition means he quotes these statistics: From 1869 to 1892 the standing armaments (peace effective) of nineteen European States rose from 2,195,000 to 3,240,000 men. In 1869 the total number of trained men ready at hand for the war purposes of twenty European States amounted to 6,958,000 men; in 1892 there were actually ready for service 12,564,400. When the existing laws have had their full effect, there will be 22,621,800 men in Europe trained for war. The aggregate of the budgets for the armies and navies of Europe in 1869 amounted to \$560,000,000 for nineteen States. In 1892 they amounted to a sum nearly double—\$990,000,000. Reckoning on \$200 a year earned by every man withdrawn from productive expenditure, we get another \$648,000,000. So the total yearly cost of European militarism is at least \$1,638,000,000. In twenty months during peace there is spent as much as Mr. Giffen reckons the ten months of Franco-German war cost directly and indirectly. The national debts of Europe now amount to twenty-five thousand million dollars.

FUTURE COMPETITION BETWEEN EUROPE AND AMERICA.

What, then, of "the future competition between the United States of America and the Disunited States of Europe?" "We all know how slight a handicap may decide the advantage in the fierce competition for the neutral markets of the world. . . . As the young Giant of the West comes to its full stature, is it a rash speculation that armaments amounting to three millions of men and national debts amounting to a total sum of twenty-five thousand million dollars, may just suffice to turn a trembling scale?"

"Even now the competition would be seriously felt, were it not that the States choose to throw away the wealth of their inexhaustible resources on a high protective tariff and the scandals of their pension-list. If American reformers do succeed in clearing these abuses, they may strike the sword out of our hand by leaving Western Europe to the simple alternative of deciding whether it is least disagreeable to become a confederate democracy or a wreck, for the competition of commerce would then become as ridiculous as a race between a mediæval knight in chain armor and battle-axe and a modern professional runner in flannels. In the phrase of Cobden, we shall be forced 'to turn moralist in self-defense.'"

WHO KILLED THE BRITISH FEDERATION LEAGUE?

MR. ROBERT BEADON informs the readers of the *National Review*, with remarkable frankness, why the Imperial Federation League was dissolved. He calls to mind that the essential aims to which the League was officially committed were that the foreign policy of the Empire should utter the united voice of all its autonomous parts and that the defense of the Empire should be supplied by the united forces and resources of all its members. Minor aims were enumerated by the official report, but in a separate class, as "conducive" but not "essential" to Imperial unity. Among these latter was commercial union.

COMMERCIAL UNION vs. DEFENSE UNION.

"The beginning of the end came about in this wise. There have always been a certain number of members of the League's Council who regarded commercial union as a part of federation, and a certain number also (very frequently the same people) who resented the idea that the colonies should ever be asked to make a real contribution to the cost of Imperial defense, and of those services generally which exist for the common and equal benefit of all Her Majesty's subjects. The protagonist of both these views has been the High Commissioner for Canada, Sir Charles Tupper. Of course, no one could call himself a supporter of Imperial federation and at the same time repudiate the last-mentioned idea in terms. Sir Charles Tupper has, to be sure, always loudly proclaimed that the colonies would do their share and rally round the old country in her hour of need, and so forth. But his assent to the doctrine of common responsibility for common objects has been purely academic. When it comes to the point of recommending that a colony should take a real and effective share in the burden of Imperial defense, he falls back upon the plea that Canada, at any rate, has already done all, and more than all, that is due from her (apparently for all time)."

"IT WAS SIR CHARLES TUPPER'S HAND."

"It was by Sir Charles Tupper's hand that the match was applied which caused the final explosion. In January, 1893, shortly after the issue of the report, he, being a member of the committee which unanimously issued it, wrote a letter to the Secretary of the League in Canada," in which occurred the fatal sentence, "that the most active members of the Imperial Federation League were mainly intent on levying a large contribution on the revenues of the colonies for the support of the army and navy of Great Britain."

This representation of the League's project of a truly Imperial army and navy as an effort to gain a rise for the home country alone, created great resentment. Sir Charles finally confessed that he had been shown to be wrong in his statement. But the differences revealed by the discussion thus aroused were so fundamental and irreconcilable as to make the dissolution of the League a necessity. The ma-

majority in number and in influence adhered to the primary lines, but the minority was exceedingly active.

THE HISTORY OF "THE CHILTERN HUNDREDS."

A CURIOUS bit of peculiarly British development is described by the *Quarterly Review* in an article on the "Stewardship of the Chiltern Hundreds." The writer explains that a crown steward is the custodian of one of the Manors or Hundreds or Honors belonging to the royal demesne. The manor is the Anglo-Saxon township Normanized. Hundreds were aggregations of townships within a given shire. The abuses perpetrated by many of the stewards led to the successive reduction of their numbers and powers, until under Charles II all stewardships were, with a few exceptions, abolished. "One of the few crown stewardships which survived the clean sweep made by the Merry Monarch was that of 'the three Hundreds of Chiltern in the county of Bucks, that is to say, Stoke, Desborough and Bonenham.'" The Chiltern Hills pass right through the country from Tring in Hertfordshire to Henley in Oxfordshire, and two out of the three Hundreds are immortalized in the names of Stoke Pogis and Burnham Beeches. From earliest Norman times this union of Hundreds had been "in the hands of the Lord the King."

Sequestered and sold under the Commonwealth, it reverted to the Restored Crown, and appears to have been leased from 1679 to 1710 by one Thomas Doyley, who is its last recorded *bonâ fide* steward.

WHEN FIRST A CONVENIENT FICTION.

The Place act, passed in Queen Anne's reign, requiring M.P.'s on becoming place-holders to vacate their seats, was not held to apply to royal stewardships until 1740. The decision then made seems to have suggested the idea of utilizing crown stewardships as a means of enabling members to resign, for a member has, properly speaking, no power of voluntary retirement. "It was not till the year 1750 that this ingenious 'constitutional fiction' came into practical working. In that year, the stewardship of the Chiltern Hundreds was conferred upon Mr. John Pitt, M.P., solely in order to vacate his seat. It was next granted in 1753, and has been in constant use for the same purpose ever since. Nor does it stand alone. The stewardships of various other crown Manors have been applied in the same way at various times."

At first, the bestowment of the liberating stewardship was made a matter of party favor; and the Government in office refused so to oblige members of the Opposition. Lord North seems to have been the last member who upheld the bad practice. In 1858 its bestowal was made subject to the control of the House of Commons. In 1861 the words expressing honorable confidence in the recipient were struck out of the warrant. It is a difficult question whether the Chancellor of the Exchequer can refuse the stewardship to any applicant. The reviewer expects that the liberty of resignation, without resorting to this ancient fiction, will soon be granted.

INDIAN CURRENCY.

SIR GUILFORD MOLESWORTH, one of the delegates from India to the recent Monetary Conference, contributes a paper to the January *Annals of the American Academy* treating of the Indian currency question. He takes as his text the remark made by Mr. Evarts when Secretary of State:

"The British Empire is neither monometallist nor bimetalist, but bi-monometallist. The British Empire cannot be monometallist gold nor monometallist silver throughout its length and breadth. Its present position of bi-monometallism is entirely inconsistent with reason and government; it must be bimetallic sooner or later, for it cannot maintain the permanent position of a house divided against itself, which cannot stand."

Continuing, he says: "So long as silver and gold were kept, by the monetary laws of France, the joint money of the world at a fixed ratio, this bi-monometallism of England and India, although productive of some minor inconveniences, was little more than nominal and did not involve any serious complications; but when the link between gold and silver was broken by the violation of the monetary law in 1873, very grave difficulties rapidly developed as the result of this illogical position. In 1871, when the rupture of the link between gold and silver was merely contemplated, M. Ernest Seyd predicted that it would 'only lead to the destruction of the monetary equilibrium hitherto existing and cause a fall in the value of silver from which England's trade and the Indian silver valuation will suffer more than all other interests, grievous as the general decline of prosperity over the whole world will be.' . . . The fidelity with which this prediction has been fulfilled is perfectly marvelous. Soon after 1873, when the link was broken, a depression of trade unexampled in magnitude and duration set in, and after twenty years it shows no signs of abatement, but, on the contrary, threatens to increase in intensity. . . . The gold-using countries generally, and Great Britain in particular, have really suffered more than India from this violation of the monetary law. . . . The rupee, in common with silver all over the world, has not until very lately altered in value (*i. e.*, in its purchasing power), but has remained stable while gold has appreciated; consequently the producer in India has enjoyed an immunity from those evils which are caused by an appreciating standard and which have weighed so heavily on his gold-using competitors. . . . India has exchanged the currency which has hitherto been stable for one that has proved eminently unstable during the last twenty years."

"The government of India," says Mr. Molesworth, "has striven to the utmost of its power to induce the home government to adopt the only practical solution of the difficulties that beset her, namely, a return, by international agreement, to the monetary law which has been violated; but, as this has been refused, India has been left on the horns of a dilemma, to choose between two evils, which have been aptly

designated, the 'Policy of Drift' and the 'Policy of Despair.' She has chosen the latter and it now remains to be seen which is the greater evil of the two."

Mr. Molesworth then makes a brief survey of monetary history to show that confusion in the currency in past times has been due to the failure to establish among nations a common ratio between gold and silver, and follows this with a brief account of the Indian currency and of those conditions which have affected it. He relates how the Indian government, realizing the bad effects of the violation of the monetary law by France in 1873, has for many years been endeavoring to persuade England to enter into an international agreement for a uniform standard of value, or failing this to permit them to limit the mintage of silver in India with the intention of introducing the gold standard.

Prior to the recent Brussels conference these efforts to persuade England to consent to an international agreement for the free coinage of both gold and silver were renewed.

Meanwhile the government of India, fearing the crisis that might be expected in the event of a failure of the Brussels conference to arrive at a satisfactory result, prepared to close their mints and began to make arrangements for the establishment of a gold standard in India. This would involve two steps:

"1. The closure of mints to free coinage of silver, the government retaining the right of purchasing and admitting it.

"2. The mints to be opened to the free coinage of gold. If gold were not brought to the mint in sufficient quantity, or the value of the rupee should fall below the fixed ratio, it would be necessary to reduce the rupee currency until its value could be restored."

On June 25, 1893, these steps were taken, the policy of drift was given over and the policy of despair adopted. "The bolt has fallen, and he would be a rash man who would attempt to predict the results of this measure."

"The currency of India is now in a condition which is a complete violation of all sound principles of currency. It consists of a huge inconvertible token coinage; practically a gold standard without a gold currency or even a gold reserve. The rupee circulates at a value much above its intrinsic value as bullion. It is no longer international money. Hitherto it could be exported without loss, but now it cannot be used out of the country with a loss of about twelve per cent., a loss which will increase, in all probability, to an indefinite extent. Nor is there in India—as in France, Austria or the United States—any large reserve of the standard metal to meet a possible emergency."

After showing in how many ways this artificial raising of the value of the rupee would do harm to India, Mr. Molesworth concludes: "The double standard is in perfect accord with sound economic laws, but the artificial raising of the value of the rupee is opposed to them, and, being a violation of all monetary laws, must sooner or later end in disaster. It is that forced elevation of the value of

money which Bentham in his 'Principles of the Civil Code' denounced as a 'fraudulent bankruptcy' and a 'foolish fraud.'"

WHY THE SICILIAN PEASANTRY IS IN REVOLT.

BOTH the *Nuova Antologia* and the *Rassegna Nazionale* naturally devote long articles this month to the elucidation of the causes which have led to the sudden outbreak in Sicily. The *Rassegna*, in an article by R. Corniani, sums up with admirable clearness the main causes for the extreme poverty from which the peasantry are undoubtedly suffering.

1. Absentee landlordism, with all its attendant evils, so familiar to us in Ireland. In Sicily the palaces of the nobility are only to be seen in the chief towns; the landed proprietor never lives on his estate, and leaves all his affairs in the hands of his agent or *gabellotto*, a term which in Sicily is synonymous with extortioner.

2. The land-tenure laws, by which it is extremely difficult, and often impossible, to sell or to break up large estates.

3. Unscientific cultivation, which necessitates a large portion of the land always lying fallow.

4. A comparative lack of charitable institutions.

5. Conscription, always most unpopular in Sicily, and which was only introduced by the government of "United Italy."

6. Finally, and most important of all, the heavy financial burdens imposed by the fiscal system, which is so balanced as to fall almost entirely on the humble cultivators of the soil.

In answer to the oft-repeated question as to whether the now celebrated "Fasci dei Lavoratori," or Labor Associations, are Socialistic in their teaching, the *Nuova Antologia* gives the following facts as to their origin: "In 1867 Bakourime, who was not only a Socialist but an Anarchist, succeeded in founding a section of the 'International' at Naples, and, in the same year, proselytes from there established a sub-section at Sciacca (in Sicily). In 1868 the so-called 'Sons of Labor' of Catania also affiliated themselves with the 'International,' and carried on a correspondence with many workingmen's societies throughout the island. . . . The paternity of the majority of the 'Fasci' may therefore be ascribed to Socialism. If some of them existed at first as merely electoral associations, their transformation into their actual character is the special work of il Bosco, de Felice, and other well-known Socialists. Il Bosco admits this himself, and confesses that the federation of the 'Fasci' is largely molded on that of the French labor syndicates and the Paris 'Bourse du Travail.' . . . The associations of the smaller towns are affiliated to those of the larger, and these latter form a federation for each province. The presidents of the provincial committees form the central council, whose business it is to co-ordinate the action of all the associations, and to control its manifestations."

The writers in both magazines agree in asserting

that the marvelously rapid growth of the "Fasci" is entirely due to the exceptional hardships suffered by the peasantry, and urge on the government remedial measures as an immediate corollary to coercion.

IS EUROPE GOING MAD?

A Study of Modern Literature.

DOUBT as to the general sanity of modern Europe is put forward, not in any freak of caricature, but in sober, scientific earnest, by the opening article in the *Quarterly Review*. It is entitled "Anarchist Literature," but by this phrase is meant not the writings beloved of bomb throwers so much as the leading literature of the period. Dr. Max Nordau, from whose work on *Entartung* (degeneration) the reviewer principally draws his material, is the author of the famous "Conventional Lies of Civilized Humanity," a Positivist who denies God, the soul, and judgment to come, and regards the individual as "but an unimportant episode in the life of the All." In his book he approaches modern European literature from the dispassionate standpoint of the student of mental pathology. His diagnosis is gruesome reading. "He discovers that the characteristic of modern fashion is a diseased imitation of other periods, a singularity which is never original; . . . resulting in a distraction which is not without affinities for hysteria. Tokens of confusion abound, in dress, decoration, and manners."

THE AGE OF STEAM: BRAIN FATIGUE.

Of the literature which reproduces modern life he finds "degeneration" the characteristic, and the source of that degeneration is brain fatigue. "Fatigue, undoubtedly—the result of a hundred years living at high pressure—will explain the worn out nerves, and consequent demand for unhealthy stimulus, which are the immediate causes of European decadence. . . . A civilized man's environment now presses upon him with a force some twenty or twenty-five times greater than it did before the age of steam. To keep the balance . . . the present race of Europeans should have strengthened their nervous centres to a degree which would make them men of genius. Yet . . . by the use of narcotics and artificial excitement, they have deliberately weakened them . . . It ought not to astonish us that such exhausted temperaments breed hysteria; or that from hysteria should result the 'intense self-consciousness.'"

THE HYSTERIA OF THE MASSES, ETC.

Hysteria is the consequence of fatigued nerves; its mental equivalent is melancholy, or the state in which impulse conquers reason; development is arrested, and second childhood frequently ensues. "Bishop Butler is known to have asked whether nations could go mad. Max Nordau would not hesitate to reply in the affirmative. He believes that the 'hysteria of the masses' in Europe is an ascertained fact, evidence of which is sadly forthcoming, in the statistics of crime, insanity and suicide."

THE SAVAGES OF CIVILIZATION.

The earliest activities to waver in a diseased organism are the moral habits. Degeneracy shows itself in "moral insanity." "The emotional temperament, the 'obsession' of fixed ideas, the imagination open to every fantastic influence, the depression, the lack of perseverance in well-doing, the pessimism, and, behind all this, the confused incoherent thought which is guided by no principles and lives by imitation,—such are notes of many an artist, poet, romance-writer, but also of criminals, anarchists and tenants of the asylum. . . . These men and women have failed in adapting themselves to the stage of civilization which we have now reached. . . . These furnish the elements, or the prime stuff, out of which anarchy is produced. . . . They must needs be revolutionary, since, in the social order, they can neither find nor make a place for themselves. They are the savages of civilization,—the barbarians in our midst.

"It is only physicians—and especially alienists—who remark the weakness of will and the chaos of thought, which in our society are masked by conventional manners or carried off as fashionable frivolity."

MYSTICS AND EGOTISTS.

Proceeding to classify his anarchist authors, Max Nordau divides them into two principal groups—"first the Mystics, among whom he reckons the Præraphaelists, the Symbolists and the Occultists; and second, the Egotists, to whom belong the Parnassians, the Satanic school, the Decadents and the Realists. All these have a common element, which is impulse, or instinct." "He concludes that Mr. Swinburne is a 'mattoid' and that Rossetti was an 'imbecile.'" "Verlaine is a 'degenerate'; he is a 'circulating' or 'periodic' case, of the obsession of ideas."

TOLSTOI A DEGENERATE.

Nordau convicts Tolstoi of "all those peculiarities which are found in the degenerate." In M. de Vogüé's word, Tolstoi has "the mind of an English chemist and the soul of a Hindu Buddhist." In his teaching he is "passive to the verge of idiocy." The reviewer asks, would any one acquainted with the conditions of a sound mind affirm that such were existent in Rousseau, Victor Hugo, Comte, or again in Coleridge, or at all times in Carlyle?"

WAGNER WITHOUT ORIGINALITY.

Nordau argues that Wagner "was a 'graphomaniac,' incessantly repeating the same ideas; that he was haunted with a sense of persecution, was emotional to excess, overcome by delusions of his own greatness, a worshiper of the sensuous, a mystic as well as an unbeliever and a decided anarchist."

Wagner betrays an utter lack of creative power. "Never, indeed, was there such borrowing. Wagner's 'drama of the future,' says Nordau mockingly, 'is all of the past.'"

Nordau refuses to regard these morbid symptoms as aberrations of genius; the lack of creative power reveals the presence of a diseased temperament which

is no part of genius. He classes among the inferior crowd of degenerates "the adepts in occult science, followers of the black art, dealers with spirits, theosophists, Rosicrucians, whose journals circulate and whose books find thousands of readers in France, England and America."

DECADENTS AND ESTHETICS.

Of the Decadents we are told that with "their egotism, their invalid monomania and dull brain" they "delight in the perverse because it calls forth the only strong reaction of which they are capable." Their poetry, "when studied by medical experts, is seen to be absolutely of the same kind as that which their insane patients compose."

It is not only a disease of the Continent, says the reviewer, "English society betrays the same deep infection. . . . M. Zola has received the homage of London clubs, as representing French literature; but a more delicate sensuality than his reckons its votaries among us by thousands. . . . The esthetic movement, therefore, whether in France or among ourselves, with its imbecile following of Decadents, weaklings and criminals, not only degrades art, by eliminating from it the moral idea, but is a danger to society. It . . . may be summed up as the residuum of civilized life, a centre at once of corruption and disorder."

IBSEN THE STANDARD-BEARER OF ANARCHY.

"In these latter days, the poet, dramatist and standard-bearer of anarchy is Henrik Ibsen." He emphatically in mind and morals betrays the marks of the degenerate. "His leading motives, so far from being modern, are borrowed from the religious beliefs in which he was brought up, as a Swedenborgian or Kierkegaard Lutheran." His characteristic ideas are "confession, redemption, and original sin in the form of a malignant heredity." "He is at once a plagiarist of the old and a rebel against it. In other words, he denies but cannot create; his art, with some notable exceptions, is disguised and degraded reminiscence."

WHITHER ARE WE DRIFTING?

The reviewer asks in alarm, "Has degeneration grown, from merely French and national to European? And will it continue to grow?" "The state of things should hysteria, decadence, nervous exhaustion, worship of the occult and the preternatural, Wagner music, and the bacillus of anarchy, flourish and prevail so as to become, in parliamentary phrase, the order of the day, Nordau has sketched in a *bizarre* and curious chapter, not unlike the chronicles of a lunatic asylum.

Mercifully for our degenerate nerves, says the reviewer, Nordau has too much confidence in "the deep-seated vitality of mankind" to expect Europe to sink wholesale into Bedlam. He is certain of one thing: that degeneracy will sweep away its own victims. The literary anarchist will perceive in his first encounter with the barbarians that his strength, like his intellect, was a delusion. A revolt of esthetic heroes against the army of the proletarians would not

last long. If degeneration continues the collapse of an exhausted society would soon ensue.

TWO ALTERNATIVES.

Nordau holds out two alternatives. The masses will either accommodate themselves to the demands of the electric age, or finding its strain too great, will grow careless of new discoveries, and "that may come to pass which the mediæval centuries witnessed—a people rearing their huts, in contented ignorance, on the ruins of Cæsar's Palace, and letting the masterpieces of science and literature fall into oblivion . . . It is possible, therefore, that science and literature may perish, lest the human race be sophisticated into disease and death."

Science—physical or biological—has not the answer of life in itself. Nordau's hope lies in the perennial fact that men "take an interest in the thoughts of their fellow men. The artist, the *maker* in prose or verse, will be to them as a prophet."

THE BACILLUS OF UNSOUND LITERATURE.

Since "what is lacking to the Anarchist in politics, in literature and in life is creative power," the reviewer asks, "What can be done to cure him?" "Max Nordau would have the public attention drawn forcibly and repeatedly to the affinities which exist between these schools of art and the kinds of insanity they body forth. He would recommend that the bacillus of unsound literature be studied by physicians, its specific differences noted and the public put on their guard. . . . He feels disposed to approve of a department corresponding to that of education or religion, the business of which should be to train journalists and men of letters. . . . Societies might be established to put down the worst kinds of literature, which are now sown broadcast over Europe. The public opinion of universities should make itself heard. And, in general, men should understand that in publishing a bad book the author is as much guilty, and ought to be as amenable to punishment, as if he had incited to crime or rebellion."

THE MORAL OF IT ALL.

Such is the plan of salvation which a Positivist man of science offers to a continent daily growing more insane. The reviewer adds his own convictions: "These forces are too mighty for science to handle them alone, or subdue them as a sovereign mistress. Unless the great inspiring genius of all time, which is an embodied and objective religion, be called in to its aid, we may question whether it will overcome the growing anarchy, and not rather, in some wild era of revolution, be trampled under its feet.

"Man is so made that he must believe in the Invisible and adore the Supreme; if his God be taken from him, then to idols, witches, and the like he will have recourse, huddling up a deity out of rags and stage-properties, rather than be left alone in the universe. That is the moral of these frightful and unclean apparitions, which, as from the tomb of Faith, call aloud during the dark hours that it will rise again."

THE PSYCHOLOGY OF CRIME.

THE *Nyt Tidskrift* has a very striking and cleverly-written article by Ivar Flem, entitled "The Psychology of Crime." The hypothesis which forms its groundwork is one that is likely to attract a certain amount of attention, throwing as it does an entirely new light upon crime and the criminal. Professor Lombroso fathers the notion that criminals are a separate race of humans who, by reason of backsliding or avatism—that newly-coined word which signifies the influence, good or evil, of one's great-grandfather—are *born* to take life in the same barbarous manner as our ancestors of centuries and centuries ago, and simply follow a natural law. It is not a cheerful notion. One would like to think that Nature mercifully lets the dead past bury its dead, instead of stirring up one's great-grandfather and causing those dry bones to live again. Welcome, then, to Ivar Flem's suggestion, which lets at least that old man sleep in peace with only his own sufficient sins to answer for! and which bleaches much of the horror of crime, whether it be theft from one's benefactor, the betrayal of one's truest friend, ay, or even murder, making it as innocent almost of any active evil impulse as the vagaries of the dreamer's brain. We speak of a "cold-blooded, deliberate" murder. According to the hypothesis of Ivar Flem, the very "deliberation," paradoxical as it may seem, may be used as a plea in the murderer's favor, for *crime is simply the result of self-hypnotism*, and the man has become hypnotized by the evil suggestion that on a sudden flashed into his brain and hung there, and hung there, and hung there, till, staring at it fixedly with his mental eyes, he became a moral cataleptic, and was *forced* to obey the suggestion. In his normal condition he had no more desire to shed blood than to eat tallow candles. "Deliberation" therefore comes to mean nothing more or less than a slow self-hypnotism, and "cold-bloodedness" would express merely the absence of all feeling, as demonstrated by Professor So and-so, when he begins to stitch his subject's tongue to the cheek. The "odious force" theory of hypnotism being thrashed out, and the discovery having been made that you may put yourself into a cataleptic state by simply staring steadily and fixedly upon some bright particular object, Ivar Flem's suggestion of moral hypnotism is, perhaps, as logical as any, and an infinitely more comforting one to reflect upon than Professor Lombroso's. We are not all of us hypnotic subjects, but we can readily understand how the weak-minded among us obey the command of that Master-hypnotist Self and "concentrate the thought" upon some glittering temptation—waking out of their moral trance to stand dismayed and wonder, "Was it I who did this thing?" But there is hope in the theory of Ivar Flem. The weak-minded may learn from the strong—may defy and refuse to look upon the evil suggestion that slinks into the brain of the best of us at times. It is only if Nature *dooms* the unborn child to be a moral cripple that we are lost indeed.

The article is a lengthy one, and space has not permitted us to give more than the gist of it. Ivar Flem has cited several instances in support of his doctrine, one or two of which, however, are not well-chosen and might have been excluded, the remainder lending force enough to his argument.

CAN CONSUMPTION BE CURED?

ONE of the leading articles of the month is that by Dr. H. M. Biggs, who writes in the *Forum* on the proposal "To Rob Consumption of Its Terrors." He tells us that there is no longer any doubt that pulmonary tuberculosis is communicable, that the knowledge of the causes in the transmission of consumption is exact and based on the most careful and convincing experimental observations. He asserts that positive proof of the communicability of tuberculosis was conclusively established by Dr. Robert Koch in 1892, and that since, the observations of this physician have been confirmed by experimenters in every country in the civilized world, the results of all agreeing with his conclusion that the sole exciting cause of tuberculosis is the tubercular bacillus.

THE TUBERCLE BACILLUS.

The evidence of the causal relation of tubercular bacilli to tuberculosis is summarized by Dr. Biggs as follows: "A peculiar germ called the tubercle bacillus is constantly present in the diseased tissues of men and animals suffering from tuberculosis. This germ can be readily distinguished by its morphological characteristics and its reaction to staining fluids from all other micro-organisms; it is never present in any disease excepting tuberculosis; it has been grown or cultivated in proper substances outside the living body for long periods of time; and when the growths or cultures suspended in distilled water are used for the inoculation of susceptible animals the same disease, tuberculosis, is produced, with the same changes in the tissues; and in these diseased tissues the same germ is present with the same morphological appearances and the same staining reactions. Finally, it has been shown that no other kind of living or dead thing can or does produce this disease, when used for such inoculations."

HOW THE GERM IS TRANSMITTED.

Dr. Biggs goes on to say that it has been shown experimentally that the dust from the walls in rooms is capable of producing the disease when used for the inoculation of susceptible animals; and that also it has been abundantly established that tuberculosis may be transmitted by meat or milk from tubercular animals. We are further told that the tubercular bacilli do not multiply outside of the living body. Since, as it has been shown, the disease is due to these germs, it follows as a necessary sequence that when the disease occurs it must be produced by the same individual germs that have been thrown off by some other human being or animal suffering from tuberculosis.

SUSCEPTIBILITY AS A FACTOR.

While the tubercular bacillus is the sole exciting cause of pulmonary tuberculosis and of every other form of tuberculosis, it must not be assumed, says Dr. Biggs, that it is the only factor in the causing of this disease. "In every infectious disease it is the relation between two opposing sets of forces which determines the question of susceptibility or insusceptibility to infection. These forces are, on the one side, the number and virulence of the germs which at a given time gain entrance to the body of the exposed individual, and on the other side the resistance of the body to these germs or the power of the body to throw off or destroy them. The resistance depends largely upon several factors, such as the avenue of entrance of the germs (*e. g.*, the alimentary tract, respiratory tract, etc.), the vital condition of the parts with which the germs come immediately in contact, and the state of general nutrition. In a large number of individuals the natural resistance to the tubercle bacillus is so great that under such conditions of exposure as exist ordinarily the disease is not contracted." It is, Dr. Biggs continues, communicated with far less facility than many other diseases that are properly called contagious. A long exposure to infection and long association with the person are required, unless because of some peculiar conditions the natural resistance has been much reduced.

CONSUMPTION IS NOT HEREDITARY.

The popular belief in the hereditary character of consumption is declared by Dr. Biggs to be entirely without scientific proof. He asserts that parents do not transmit the disease itself to children, but may transmit a constitution that is peculiarly susceptible to this kind of infection, this inherited susceptibility simply rendering the individuality a more easy prey to the germs when once they have gained entrance.

Dr. Biggs adduces evidence to show that consumption is comparatively rare among those who live an outdoor life under normal and healthy conditions, and that it becomes more and more frequent among those whose occupations involve long confinement in a more or less vitiated atmosphere. For instance, out of every one thousand deaths among farmers, one hundred and three die of pulmonary tuberculosis, while for one thousand deaths among printers and compositors four hundred and sixty, or nearly fifty per cent. of all, result from consumption.

IT MAY BE PREVENTED.

Considering the means to be taken for the prevention of pulmonary consumption, Dr. Biggs asserts that from a sanitary and economic point of view all the communicable and preventable diseases sink into relative insignificance when compared with this one. He makes the remarkable statement that if as many deaths occurred daily for one month from Asiatic cholera in New York as from pulmonary consumption, the city would be well nigh depopulated as a result of it. "It has been shown that one-seventh of the total mortality of the civilized world is due to tuberculosis, and one-fourth of the deaths occurring during the working period of life is caused by it. Over 30,000

deaths were reported to the New York City Health Department as having been caused by the tubercular diseases during the five years ending January 1, 1893. Of these more than 26,000 were caused by pulmonary tuberculosis. The average mortality is about 100 a week. As compared with this, the total number of deaths caused by the other infectious diseases, including small pox, typhus fever, typhoid fever, scarlet fever, diphtheria, measles and whooping cough, was only a little over 21,000, or about two-thirds of the number produced by tuberculosis alone."

IT IS OFTEN CURABLE.

Dr. Biggs maintains that consumption is curable in a large proportion of cases, providing only that its nature is recognized early and proper means are then taken to prevent its extension. There can be no question, he continues, that consumption may almost, as a rule, be completely and permanently cured among the well-to-do class when the nature of the disease is recognized early and the persons removed temporarily or permanently to favorable localities. "The knowledge we now have of the causation of tuberculosis makes possible the formulation of perfectly efficient means for its prevention. Of the infectious diseases it is without question one of the easiest to prevent, and, when thoroughly established, one of the most difficult to cure.

CONSUMPTIVE PATIENTS SHOULD BE ISOLATED.

"The duties of State, municipal and sanitary authorities in this matter are clear and specific. Comprehensive and efficient means should be at once taken for the prevention of tuberculosis. These means should consist in educating the people as to the communicable character of the disease; in instructing them in the measures to be taken to render the sputum innocuous; in the systematic employment of bacteriological examinations of the sputum for the early diagnosis of tuberculosis; in the proper disinfection of rooms occupied by tubercular patients before they are again occupied; in the establishment of public hospitals for the segregation, isolation and treatment of the consumptive poor; in the enactment of regulations which shall forbid the employment of tubercular persons in such occupations as shall expose others to danger; in the adoption of sanitary regulations to prevent the dissemination of infection by means of tubercular sputum in places of assembly; in the governmental inspection of dairy cattle and the destruction of those found to be tubercular."

The writer lays especial stress upon the importance of the proper isolation of the consumptive poor, and advises that institutions for consumptive patients should be established outside of cities, where the conditions for recovery are more favorable than they are within their limits.

It is especially among the poor that the greatest danger of transmission exists, and the isolation of these patients in proper institutions would not only make it possible to give them the best medical care and the best chance for recovery, but would also diminish proportionately the dissemination of infection throughout the city, and so the number of new cases.

THE MAKING OF SCOTCH DOCTORS.

THE place of honor in the *Scottish Review* is given to a lively and instructive account of the medical schools of Scotland. The writer describes "making doctors" as "one of the staple trades of Scotland." Her output in five years (1888-92) was 3,000 practitioners of medicine, 1,000 of whom were needed for home consumption, leaving 2,000 for export. "Scotland, with only 11 per cent. of the population of the United Kingdom, has supplied 45 per cent. of the new crops of doctors for the Empire." The five best years of his life, the mastery of 10,000 octavo pages of closely printed text-books, besides attendance on practice lectures and experiments in hospitals and elsewhere, are requisite to qualify the student to serve as doctor. The reviewer is mightily proud of the Edinburgh system of teaching.

FREE COMPETITION IN TEACHING.

In 1855 the lectures in non-university medical schools were accepted by the University as of equal value with the teaching of professors. "Any man who satisfies the colleges that he can lecture, and has the means of proper teaching, is allowed to do so. As many as may like can lecture on the same subject. If the professor gets old, or lazy, or inefficient, the students can go, and do go, to the extra mural teacher. . . . If he succeeds he gets students and an income, and has a good chance for the professorship when it becomes vacant.

"In proportion as students were attracted to the extra mural teachers the professor's income fell off. It was a system, therefore, of every man for himself, and starvation to the hindmost, in and out of the University. No other school has adopted the same system. It is unique in the world. The new Universities Commission have, by their recent ordinances, seriously modified the competitive aspects of the system. . . . The professors are in future to have an irreducible minimum salary and a fixed maximum."

WHAT IT COSTS TO BECOME A DOCTOR.

The cost of medical education, north and south of the Scottish Border, is thus estimated: "In London, the 'Student's Number' of the *British Medical Journal*, for September, 1893, puts down the minimum cost at the cheapest schools there, great economy being exercised in living, at £587, while in the provincial schools of England it is put down at £500. . . . We have no doubt that at the School of Medicine in Edinburgh, or at Anderson's College, or St. Mungo's, or at Aberdeen, a young man, by stern economies, which will do him no harm in the long run, could enter the medical profession for between £300 and £400."

The reviewer pleads for "some scheme of payment by results for original investigation," and for the resolute enforcement by public bodies of the rule that all "unclaimed bodies" may be used for dissection. He accepts "the modern ideal of the doctor that he should be the priest of the body," and believing in the Scottish race, holds that "medicine and medical teaching is one of the strong points of Scotchmen."

WHAT KILLED HINDU SCIENCE.

SCIENCE in India, after having rapidly advanced, "came to a dead halt and began to degenerate into fanciful fiction, not unmingled with superstitious folly. The keenness of perception, the accuracy of observation and the acuteness of inductive reasoning, which marked the earlier stages of its growth, seem to have entirely disappeared after it reached its period of stagnation." Such are the statements which open an instructive article in the *Calcutta Review*. "The only probable solution," says the reviewer, "is to be found in the rise of the schools of philosophy, especially of the *Vedantic*, the most popular among them. . . . That philosophy proved a curse to the country of its birth, so far as its material advancement was concerned. The supreme contempt it displayed for things of this world and the perfect *insouciance* with which it taught men to view them, dealt a death blow to the progress of science. . . . The mind of man must be introspective, and must not be led away from its true pursuit by the unrealities of external nature. The Absolute Reality . . . formed the only fitting object for the *Jogee's* contemplation.

"THE MOTHER OF INVENTION" ABSENT.

"Nature was cruelly benevolent to the Hindu, and his education accentuated the emasculating influences of this merciful malevolence. Nature supplied him all but gratuitously with the bare necessities of life, and his philosophy taught him to be content with the low standard of living that could thus be had without any serious cost of time or trouble. Nay, it went further—it inculcated on him, with all the earnestness it could command, the duty of self-abnegation and self-mortification, abandonment of the pleasures of life and apathy to creature comforts and physical conveniences."

Where observation of external nature was not necessary some progress was, it is true, achieved by the Hindu: "Grammar and deductive logic, which hardly stood in need of any practical basis, found favor with him and were brought to a considerable extent to a state of maturity. Dr. Ballantyne has shown that Gautama carried the analysis of the syllogism to a greater perfection than Sir William Hamilton. . . . But logic met with the same fate in India as it had in mediæval Europe."

PECULIARITIES OF HINDU MEDICINE.

The scientific faculty thus lost has not yet been re-acquired. "Though the Medical College of Bengal was founded in the year 1833, medical science has been hardly indebted to its alumni for any addition to the already existing stock of knowledge." Most candidates for university degrees markedly prefer the literary to the scientific courses. In the medical works under review "Primitive religions or metaphysical doctrines about cosmogenesis and anthropogenesis have been mixed up with the truths of physiology and midwifery. . . . It is confidently asserted, for instance, that the feet and the sense of sight owe

their origin to fire, the skin to air, and the ear and the faculty of speech to ether, and this on no higher proof than that walking generates heat, that sight is only possible with the aid of light, that the skin is the organ of touch, and that the power of speech is one of the principal means for the generation of sound, while the ear is the medium for its conveyance."

Nevertheless, some results of Aryan research harmonize with those of modern investigation: "The main outlines of the theory of digestion and assimilation have also been shadowed forth in Hindu physiology. The secretion of different fluids for the purpose of digestion was not unknown to it. . . . There are passages in the works on Indian medicine which go to show that Hindu physiology was trembling just on the verge of a discovery which has placed the name of Harvey in the foremost rank of European scientists."

A POSTHUMOUS ARTICLE BY RENAN.

THE *Revue des Deux Mondes* begins the year 1894 with a remarkable posthumous article by Ernest Renan, entitled "The Jews Under the Roman Domination." The hand of the master is evident in every line, and seldom has a more awful picture been drawn of Roman civilization before the Christian era. In these pages Renan sets himself to tell the life story of Herod the Great. He begins by comparing him to Mehemet Ali, and describes him as having been "a superb Arab, intelligent, skillful, strong in body, enduring, and a lover of women." Of the despot's wife, Marianne, the historian has nothing but good to say: "A princess of rare beauty and irreproachable virtue, proud and honorable." Adored by her husband, she did not make him happy, and when in "a sort of privy council" Herod condemned her to death, her own mother Alexandra behaved like a fiend to her unfortunate daughter, and flew at her on her way to the scaffold, while the crowd broke into cries of horror; Marianne did not even change color, and died without looking at her mother. The tragedy being accomplished, Herod was seized with a violent reaction of feeling, became delirious, talked incessantly to his murdered wife, and for a short time it was reported in Jerusalem that he was dead.

THE SECOND SOLOMON.

During a certain period of his life Herod developed extraordinary qualities as ruler and organizer, indeed he was at one time styled the second Solomon. To the surprise, and not altogether to the satisfaction of the Jews, he reconstructed the Temple, beginning in the year 19 B.C., a work not completed for eight years. He also built a theatre, an amphitheatre and a circus, and was the first to introduce into Jerusalem combats between men and wild beasts. The worship of Augustus had become the fashionable religion in the Roman provinces, but Herod, bold though he was, never dared to elevate a pagan temple in Jerusalem, but at Cæsarea and in several other towns outside Palestine he caused edifices to be

raised in honor of the new-made god. In Jerusalem, the buildings erected by him were of finely wrought marbles, and of his fortifications, the Tower of Hippicus remains to this day to show what he did for the town. Herod also restored Samaria under the new name of Sebaste. On one occasion he sent out Alius Gallus on what we should now call an armed scientific expedition to Arabia; and the ruler's ideas and achievements, his splendors and his triumphs are wonderfully described by M. Renan.

THE MARBLE PALACE A CHAMBER OF TORTURE.

Herod the Great owed his final downfall to women. He was married ten times, and is known to have been the father of at least fifteen children. As he grew old his great marble palace became a chamber of torture; and he spent his time in seeing his one-time favorites and slaves tortured to death. His two sons, the children of Marianne, were strangled by his orders, and when he knew he was dying he spent all his time in devising what he could do to make terrible the coming day of his death by ordering a general massacre of the Jews. Thus we cannot wonder that the day of the monarch's death was put down in Israel's *album* as a day of joy; but M. Renan declares that the stories which connect him with having ordered the massacre of the innocents is apocryphal; he points out that the Saviour was not yet born when Herod the Great died at Jericho, leaving behind him an imperishable name for power, strange achievements and fantastic wickedness.

A MODERN JEW ON JESUS OF NAZARETH.

MR. JACOB VOORSANGER, who claims "without fear of criticism or contradiction" to represent the modern Jewish standpoint, gives in the January *Overland Monthly* his "View of Jesus of Nazareth." "Christianity is," he says, "a system that he fully understands as a religion, but fails to comprehend as a theology."

THE TWO PORTRAITS.

He compares the traditional with what he conceives to be the real portrayal of the Christ:—"Shorn of all theological attributes, divested of his Greek garments, disrobed and appearing in the strong light of history, the majestic character and figure of the Nazarene are intelligible enough to a Hebrew. The earliest Greek and Roman pictures of the Christ represent him as bare-headed, crowned with the nimbus, enveloped in a long flowing robe, bare foot or sandaled, with a gentle, dreamy face, every line of which is an expression of deep spirituality. Jews do not understand such a representation. It is an expression of Greek thought. The Jewish sculptor, Moses Ezekiel, born at Richmond, Virginia, has had another conception of the Christ. He had chiseled out of the choicest marble the noble figure of a Jewish patriot, strong, sturdy, attired like a Hebrew of the period of the Galilean,—a youth with *turbaned* head, and a face flashing with genius.

"That answers more faithfully to the Jewish idea of Jesus. A son of his people, his heart aflame with great intents, his ambition wholly to restore the Law, his dream that of the prophets, to bring the kingdom of Heaven to the children of earth, he preached a millennium to men engaged in quarrels and contentions. If he failed, if his life paid the forfeit, it was the sorrowful consequence of troubled times. But his teachings, as they appear upon the face of his book, not as they are interpreted by hair-splitting metaphysicians, his teachings are the genuine echoes of the holy themes propounded by the old prophets. A life led in harmony with such teachings, the same teachings given to Israel in the law and the prophets, must needs be pure and holy. This much we understand,—why cannot all the world thus read these teachings, and thus, to quote the great words of Sir Moses Montefiore, remove the title page between the Old and New Testament? But that time has not yet come."

MOSLEMS AND CHRISTIANS, HOW FAR ONE.

THE article which the venerable philologist, Professor Max Müller, contributes to the *Nineteenth Century* is fitted to make a deep popular impression.

THE SIX FUNDAMENTALS COMMON TO BOTH.

The Professor thus describes the outcome of his conversation with enlightened Turks: "After long discussions, we had generally to admit in the end that, in all the essential points of a religion, the differences between the Korán and the New Testament are very small indeed, and that but for old misunderstandings the two religions, Islam and Christianity, might have been one. . . .

"They all agreed that there were six articles of faith which all Mussulmans accepted as fundamental, and as resting on the authority of the Korán: the unity of God, the existence of angels, the inspired character of certain books, the inspired character of certain prophets, the day of judgment, and the decrees of God. . . . If then these are the six fundamental articles of the Mohammedan faith, we agreed that they would offer no ground for a split between Islam and Christianity. Every Christian could subscribe to every one of them. The mischief begins when an attempt is made to define things which cannot be defined."

IN PRAISE OF THE MOHAMMEDAN PARADISE.

What will perhaps create most surprise is the Professor's utterances on the heaven and the houris promised after death to the Moslem: "In every religion we must make allowances for anthropomorphic imagery, nor would it be possible to describe the happiness of paradise except in analogy with human happiness. Why, then, exclude the greatest human happiness, companionship with friends, of either sex, if sex there be in the next world? Why assume the pharisaical mien of contempt for what has been our greatest blessing in this life, while yet we speak in very human imagery of the city of Holy Jerusalem?"

POLYGAMY AND SLAVERY.

Passing on to another point, the Professor declares: "There are many enlightened Mohammedans who condemn polygamy and slavery. Polygamy, in fact, is dying out. Mohammed did not enjoin it, he simply tolerated it, as it was tolerated among the Jews. He left behind him these memorable words: 'I am no more than a man; when I order you anything with respect to religion, receive it; and when I order you anything about the affairs of the world, then I am nothing more than a man.' What stronger fermán can social reformers demand for the abolition of polygamy, slavery, and for other changes required?"

The Professor found, in all his discussions with his Turkish friends "there was one point which they could not gainsay, the high ideal of human life as realized in Christ and by no other prophet." In turn, he grants that Mohammed "devoted his life to the cause of truth and right, and to the welfare of his fellow-creatures. That he recognized the spirit of God in the spirit of truth within him stamps him at once as a true prophet; that he mistook that still small voice for the voice of the Archangel Gabriel only shows that he spoke a language which we no longer understand."

BUDDHISM IN ECCLESIASTES.

DR. E. J. DILLON, who sometime ago attempted from critical bases supplied by Professor Bickell, of Vienna, to "reconstruct" the Book of Job, once more appears in the *Contemporary Review* as reconstructor,—this time of Ecclesiastes. The book, as it now stands, he charges with extraordinary irrelevancy, incoherency, self-contradiction. He asks, how can it have come into its present form? And here, as in the case of Job, he falls back on a critical theory furnished by Professor Bickell. The theory, "which has already received the adhesion of some of the most authoritative Bible scholars on the Continent," may be briefly summed up as follows: "The present disordered condition of the book, Koheleth, is the result of the shifting of the sheets of the Hebrew manuscript from their original places and the addition of a number of deliberate interpolations. The latter are of two kinds: those which seemed necessary for the purpose of supplying the cement required to join together the unconnected verses which, in consequence of the dislocation, were unexpectedly placed side by side, and the passages composed with the object of toning down, or serving as a counterpoise to the very unorthodox views of the writer."

THE GIST OF THE BOOK.

By the aid of this theory the book is "restored;" and so restored falls naturally into two distinct halves: a speculative and a practical: the former rarely metrical, the latter almost equally prose and verse. "In a word, internal evidence leaves no doubt that this was the ground plan of the original treatise."

"Read in its primitive shape, it is a systematic disquisition on the questions: What positive boon has

life in store for us? to which the emphatic answer is none; and How had we best occupy the vain days of our wretched existence? which the author solves by recommending moderate sensuous enjoyment combined with work.

BUDDHISM IN ALEXANDRIA.

Whence has the author derived his pessimism? It is "utterly incompatible with the spirit of Judaism." It has been traced to Hellenic Epicureanism. Dr. Dillon thinks he has found another source: "My own view of the matter, which I put forward with all due diffidence, differs considerably from those which have been hitherto expressed on the subject. I cannot divest myself of the notion that Koheleth was acquainted, and to some extent imbued, with the doctrines of Gautama Buddha, which must have been pretty widely diffused in Alexandria toward the year 205 B.C., when the present treatise was most probably composed.

"Alasanda or Alasadda is mentioned, for instance, in the *Milindapañho*, a Pali work which deals with events that took place in the second century B.C. . . . It is quite certain that the development of Buddhism in Alexandria was very considerable; for we learn from the *Mahavanso*, a work written in 450 A.D., that no less than 30,000 Bhikshus or Buddhist monks, had come from Alasadda.

"It is evident, therefore, that a cultured Hebrew living in Alexandria under the reign of Ptolemy Epiphanes had ample opportunities of making himself acquainted with the doctrines of Buddha, and it is equally obvious that the metaphysical basis of Koheleth's theory differs in no essential point from that on which Buddha rested his humane religion, and Schopenhauer constructed his genial philosophy. . . . Undermined will is the principle of all being, the one reality underlying all appearances."

The entire reconstructed text of *Ecclesiastes*, translated into English, forms the latter part of Dr. Dillon's article.

POETIC TOURNAMENTS IN BENGALI.

MR. DENONATH GANGULI, in the *Calcutta Review*, traces at length the history of the development of the Bengali language. "Prakrit," he says, "is the mother and Sanskrit the grandmother of Bengali." Bengali was probably born about nine hundred years ago, but the first books in the language were written about five hundred years ago. He mentions later a poem of 1710 A.D., which depicts in lively colors "the bravery of Bengali soldiers in the field, and the chastity of Bengali women." "Above all, it places prominently before the reader the martial exploits of a Bengali woman, a lady on horseback with armor on, fighting with a Trishool in hand." During the period 1775-1833 A.D., which was noted for its exuberance of song, there was developed a literary contest, which seems to have been a sort of lawn tennis in the athletics of poetry. "At this period some singing bands made their appearance. They were known by the name of Kabi-wallas. . . . The people of the

time took great delight in the performances of these Kabi-wallas. Two parties were engaged, each trying to discomfit the other. The poet attached to one of the parties composes a song for the occasion, which is sung; whilst this is being sung the poet attached to the other party composes another song in reply. It must be quickly done, so that the song must be sung soon after the first party has finished its performance. If the reply given is suitable, shouts of laughter come from the audience. A rejoinder is given to the reply, and in this manner the singing parties continue to keep the audience enlivened for some time. There are Kabi-wallas to be found now, but they have ceased to exert the influence they did at the time under notice. It must be admitted that the Kabi-wallas did much to enrich Bengali literature."

The first grammar in Bengali was by a European, Mr. Hallhed, and types having been prepared was printed at Hooghly in 1778. Another European, Mr. Forster, wrote the first dictionary in Bengali.

HERBERT SPENCER'S TRIBUTE TO TYNDALL.

THE aged philosopher's eulogy on his lately departed friend appears in the *Fortnightly Review*, and possesses the charm of a manifold pathos. There is something unusually beautiful about the self-revelations of character which Prof. Tyndall's death has drawn from his nearest comrades in science. The quick, thoughtful affectionateness which pervades this article will serve to endear to many the sage whom they had formerly only admired. Mr. Spencer tells us he first met Tyndall in 1852, when "there commenced one of those friendships which enter into the fabric of life and leave their marks."

HIS CONSTRUCTIVE IMAGINATION.

Of powers of thought which have had much to do with Tyndall's success, Mr. Spencer selects as the chief "the scientific use of the imagination:" "This constructive imagination (for we are not concerned with mere reminiscent imagination), here resulting in the creations of the poet and there in the discoveries of the man of science, is the highest of human faculties. With this faculty Professor Tyndall was largely endowed." He showed it in investigation, in demonstrating, in devising fit appliances, in his expository power—"and good exposition implies much constructive imagination"—and in practicing his pupils in a similar use of the imagination. He made them active explorers.

THE UNKNOWN TO HIM MORE THAN AN ALLEGATION.

"Led as he was to make excursions into the science of mind, he was led also into that indeterminate region through which this science passes into the science of being; if we can call that a science of which the issue is nescience. He was much more conscious than physicists usually are that every physical inquiry, pursued to the end, brings us down to metaphysics, and leaves us face to face with an insoluble problem. . . . The fact, as proved by

various spoken and written words, was a belief that the known was surrounded by an unknown, which he recognized as something more than a negation. Men of science may be divided into two classes, of which the one, well exemplified in Faraday, keeping their science and their religion absolutely separate, are untroubled by any incongruities between them; and the other of which, occupying themselves exclusively with the facts of science, never ask what implications they have. . . . Tyndall did not belong to either class; and of the last I have heard him speak with implied scorn. Tyndall was an interesting companion . . . to me injuriously interesting as being too exciting."

MR. SPENCER AND MR. CARLYLE.

They did not talk much on politics, possibly because of their different views typified in the respective attitudes towards Carlyle. "To me, profoundly averse to autocracy, Carlyle's political doctrines had ever been repugnant. . . . Intercourse with him soon proved impracticable. Twice or thrice in 1851-5 I was taken to see him by Mr. G. H. Lewes; but I soon found that the alternatives were—listening in silence to his dogmas, sometimes absurd, or getting into a hot argument with him which ended in our glaring at one another; and as I did not like either alternative, I ceased to go."

MILITARY DESPOTISM IMMINENT?

Tyndall was not so opposed to the rule of the strong hand,—“would not have been reluctant to exercise such rule himself.” Subsequent experience had, however, shaken Tyndall's faith in public administrations and led him nearer to Mr. Spencer's views, while Mr. Spencer confesses that his own faith in free institutions, originally strong, has in these later years been greatly decreased. “We are on the way back to the rule of the strong hand in the shape of the bureaucratic despotism of a socialist organization, and then of the military despotism which must follow it; if, indeed, some social crash does not bring this last upon us more quickly.”

SUNDAY AFTERNOON PICNICS.

Speaking of the members of the X Club, Mr. Spencer remarks, “Out of the nine I was the only one who was Fellow of no society, and had presided over nothing.” He gives a pleasing little picture of the club's week-end summer excursions into the country, when the married members brought their wives, when Saturday afternoon was spent in boating or rambling, and a picnic in some pleasant spot—Burnham Beeches, Weybridge or Windsor Forest—occupied Sunday afternoons. “On one occasion, while we reclined under the trees of Windsor Forest, Huxley read to us Tennyson's ‘Ænone,’ and on another occasion we listened to Tyndall's reading of Mrs. Browning's poem, ‘Lady Geraldine's Courtship.’” Mr. Spencer bears witness to Tyndall's generous readiness to take much trouble to help a friend, and to “dilate on the claims of fellow workers,” as well as chival-

rously to defend the unjustly discredited. He also pays a very kindly tribute to the “unmeasured kindness” of Mrs. Tyndall. He concludes by quoting from a letter of his friend, received several years ago, in which, referring to Mrs. Tyndall's self-sacrificing care of him, he wrote, “She has raised my ideal of the possibilities of human nature.”

THE NEW MASTER OF BALLIOL.

His “Evolution of Religion” Criticised.

MR. R. M. WENLEY, D.Sc., contributes to the *Scottish Review* a weighty criticism of Professor Edward Caird's Gifford Lecture on “The Evolution of Religion.” Dr. Wenley describes his author as “the most persuasive philosophical teacher of this generation,” and as “the subtlest metaphysician of the day.” “No one,” he says, “has ever dealt with a similar mass of material so powerfully, skillfully and reflectively.” “One cannot help rising from the perusal of the work a better man.” But the grave complaint is preferred against the Master of Balliol that—to put it in plainest English—he makes the facts fit his theory instead of making his theory fit the facts. This is the common vice of the school of Hegel, and Dr. Wenley, although refusing to docket Dr. Caird as a mere Hegelian, argues that he has not freed himself from the easily besetting Hegelian sin. “The history of religions receives too little attention, the translation of some of its incidents into the language of an ‘intellectual naturalism claims too much.’”

IMPOSES PRECONCEIVED RELATIONS.

Having shown how the neglect of the psychological for the merely metaphysical method of investigation has led Dr. Caird to the partial misrepresentation of fetichism, Buddhism and Judaism, Dr. Wenley overhauls his “construction” of Christianity. “The relations in which Christianity is expected to stand to other stages in the development of religion are preconceived, and the occurrence adduced, like the individuals portrayed, and skilfully found to arrange themselves as had been anticipated. . . . To term it the ‘absolute’ religion, in a metaphysical sense, is at once to desublimize it into a philosophy. . . . In contradistinction, it may be submitted that Christianity does not start from an analysis of self-consciousness as revealed in man, but from a certain historical fact—the Person of Christ.”

FOLLOWS OBSOLETE THEOLOGIES.

Dr. Caird's construction of the history of Christianity is, Dr. Wenley complains, almost wholly on the lines of the obsolete Tübingen School. “There can be little doubt that Mr. Caird has permitted his view to be too exclusively colored by the theological deductions of such writers as F. C. Baur and Biedermann.

“The evolution of Christianity consists in the long vicissitudes through which Christ Himself has gone in relation to persons who revere Him. . . . Its

PROFESSOR EDWARD CAIRD,* MASTER OF BALLIOL.

advance can never be exhibited with historical accuracy if it be viewed simply as the logical movement of the Christian idea. Its manifoldness which eludes all categorizing, is due to its inmost nature as an objective record of the subjective attempts that men have been making in all the ages of our era to realize, each for himself, what the revelation of God in Christ implies."

IS DIVORCED FROM HISTORICAL EVOLUTION.

Dr. Wenley thus states his main criticism: "The method applied appears far too subjective, and lacks elements which empirical research supplies. There is a certain emptiness in its constitution which application to historical phenomena does not fill up. It is too easily satisfied. . . . This results from predominating attention to the inner principle of development at the expense of the outer factors, in which it is slowly, and with much retardation, being wrought out. Antitheses—simply because they are antitheses—have no power of origination, and the elementary conflict between self and not self is hardly a key to all problems that arise down (*sic*) in the details of religious progress. No doubt the prevalent tendency of such a method is a derivative from Greek philosophy, and as modern religious doctrine is filled with Greek factors, a surprising harmony has been unconsciously pre-established. . . . The metaphysical method readily finds its kin, but it passes by the unfamiliar or mistakes it for a friend. The conception of God, for example, as the unity of self and not-self is lost too completely in abstract logical relations to be adequate to an explanation of religious life or fervor. For the one is in essence theoretical, the other practical. . . . This, indeed, is the central cause of our difference from Mr. Caird. His plan is divorced from historical evolution, and may be applied to develop doctrines which are framed in accordance with a preconceived idea and by aid of unfettered choice in the selection of materials. . . . This intellectualism, together with the method peculiar to it, is as partial as mysticism or moralism.

STORIES ABOUT DEAN STANLEY.

MR. PROTHERO'S "Life of Dean Stanley" has almost made the charming old ecclesiastic live again in the reminiscences it has called up in a great number of the reviews and magazines.

TWO BOYS WHO COULD NOT LEARN ARITHMETIC.

A. K. H. B., in a bright and chatty paper in *Longman's*, tells these two stories among others: "In September, 1824, young Stanley was sent to a preparatory school at Seaforth . . . taught by Mr. Rawson, the parish clergyman. He was bright and clever, but he could not learn arithmetic. The biographer does not know, what I have heard Stanley say, that Mr. Rawson declared that Arthur was the stupidest boy at figures who ever came under his care, save only one, who was yet more hopeless, being unable to grasp simple addition and multiplication. But while Stanley remained unchanged to the end, the

other boy was to develop a mastery of arithmetic altogether phenomenal. He was to be the great Finance Minister of after years, Mr. Gladstone, the Chancellor of the Exchequer who could make a Budget speech enchaining. The future Premier was a good deal Stanley's senior, but they met. The boy's judgment is, "He is so very good-natured, and I like him very much."

HOW THE ESSAYS AND REVIEWS CAME TO BE.

"No one has ever related how the book came to be at all. I remember well how John Parker the younger told me that when the series of Oxford and Cambridge Essays which that house published came to a close, they had two or three essays on hand, paid for. So, instead of casting them aside, old Mr. Parker thought they might as well get a few more and make up a volume. This was done. The outcry was tremendous. But it sold the book as the Oxford Essays never sold."

TALES ABOUT TENNYSON.

IN *Temple Bar* appear certain "Early recollections of Tennyson," from the pen of Mrs. Brookfield, the wife of

Brooks—for they call'd you so that knew you best—
Old Brooks—who loved so well to mouth my rhymes.

"The exceeding dignity and seriousness of Tennyson's usual demeanor" made his "frequent flashes of amusement" the more welcome, she says: "On one occasion, after they had left Cambridge, my husband remembered dining with Tennyson, George Venables, and others, at the Reform Club. After dinner, Tennyson persisted in resting his feet on the table. His friends remonstrated in vain, until one of them said: 'Take care, Alfred, they will think you are Longfellow.' Down went the feet."

In 1855 the writer was on a visit to the Ashburtons in Hampshire. A large party was in the house. "Tennyson also arrived, and, I think, only the next day, the first copy of his latest poem, 'Maud,' was forwarded to him. We were, all of us, of course eager to hear his new poem read aloud by himself, and he most kindly agreed to gratify us. But there were difficulties to be got over. Carlyle and his wife were amongst the guests, and it was well known that he could not endure to listen to any one reading aloud—not even to Alfred Tennyson.

"Carlyle was accustomed to take an early walk daily and to be accompanied by an appreciative companion. What was to be done? All the visitors in the house were presumably anxious to listen to Tennyson's delightful reading. Lord and Lady Asburton were kept waiting, chairs had been arranged in a quiet sitting-room; the visitors (ourselves amongst the number) were taking their places. Alfred was ready. So was Carlyle—in the hall, waiting for a companion in his walk—and evidently he would not stir without one. It was quite an anxious moment. We each probably wondered which of us would volunteer to leap into the gulf, as it were, like Quintus Curtius of old. At length, to our great relief, Mr.

Goldwin Smith generously stepped forward, and joined the philosopher, whilst we remained to listen with enthralled attention to the new words of the poet."

ALMA-TADEMA AT HOME.

THE February *Century* begins with a capital article on Alma-Tadema, by Ellen Gosse, with exceptionally charming illustrations of the artist's home and of some of his studies.

A DISCIPLE OF LABOR.

This painter is a great advocate of work. "Nothing can be done without taking trouble, he says, 'you must work hard if you mean to succeed.' By these and similar encouragements I have many times heard him urge on faint-hearted followers. He will never allow himself to be beaten by the difficulties of any subject. No shirking of intricate detail, no vagueness of line, will this advocate of thoroughness allow to any timid or idolent pupil. He never evades a tedious accessory, nor does he spare his brain more than his hand when, by the making of endless studies, he can gain exacter knowledge, or add to the accuracy of the spirit and detail in his designs. But this diligence is not allied to any love of his own handiwork. Mr. Alma-Tadema is ruthless in destroying results that do not seem to him to be satisfactory; I have often seen him wipe from his canvas a beautiful figure or a lovely object, when he thought that by doing so the line of his composition would be improved, or that greater simplicity would be gained by the sacrifice. I have heard Mr. Alma-Tadema tell a story of the fate of two unsuccessful pictures of his student days. One of them was returned unsold by the committee of the Brussels exhibition in 1859—the subject, I believe, was of a house on fire, with people rescuing the victims. His fellow-students were asked into the studio of the rejected painter, and were invited to jump through the canvas, the owner of it leading the way by leaping, head first, through the oily flames. The other story was of a large-sized, square picture which came back hopelessly, again and again, to the easel of its creator, until at last it was cut out of its frame, and was given to an old woman to use as a table-cover, and who remarked that it 'was much better than those common oil-cloth things that always let the water through, for this one of Mr. Tadema's making was a good thick one, with plenty of paint on it.'"

IN THE ARTIST'S STUDIO.

"Mr. Alma-Tadema has no patience with would-be dilettanti, who, I fear, pester all busy professional people with fatuous inquiries about their ways of work, such as, 'Now, what color would you use if you were going to paint a bluebell?' or, 'How many hairs should an outline paint-brush have?' He thinks they should be answered as by the sculptor, who, on being asked by an ardent young admirer to show him the tool with which he had modeled his beautiful Venus, showed the muscle of his own broad thumb. Mr. Alma-Tadema uses very few paints, and those are

of the simpler and more old-fashioned kinds, such as siennas and ochres. He is firm in his conviction that the colors on a palette should be composed either entirely of mineral or entirely of vegetable substances; he considers that to mix the two kinds is highly perilous to the future safety of the painting.

"The methodical ways of this painter are apparent in the arrangements of his house, and especially in those of his studio. He is eminently Dutch, even when he tries to be most classical. From a voluminous drapery down to a small pocket pen-knife, each has its appointed place in his studio; a glance at the work-table, or along the lines of folios of studies on the many-divisioned shelves, will show this; each folio is numbered, and beneath it is written, in the painter's neat hand-writing the subject matter of the drawings within, under such sectional headings as 'Greek Headdresses,' 'Bronzes,' 'Armor,' 'Furniture,' 'Wigs,' 'Ears and Hands,' 'Ornaments,' etc. This extreme neatness, however, leads sometimes to painful anxiety; as, for instance, when some careless visitor leans against and disturbs the folds of a curtain, or crushes the surface of an embroidery."

THE BIRTH OF A PICTURE.

"When an important picture approaches completion, the whole household is aware of the painter's excitement and eagerly shares it. Professional models are insufficient to supply the demand, and a friend is called upon at night, or some member of the family in the very early morning, to dedicate a face or a hand to the great sacrifice. During these critical times Mr. Alma-Tadema's intensity is something formidable, and he is in the mood, like Benvenuto Cellini, to pour all his most precious things into the fire of his devouring art. It is very exciting to share these periods of storm and stress. They do not last very long, or who could survive to tell the tale?"

THE ARTIST'S PERSONALITY.

"Mr. Alma-Tadema's sense of humor is very broad and genial; he is a perfect fund of amusing anecdotes and conundrums, and it is often a question among his friends where he can possibly find the great number of stories and bon-mots that he tells on all occasions. As a host his manner is very hearty and hospitable, and he takes untiring pleasure in showing the beauty and surprises of his house to the numerous visitors who gather weekly at his studio.

"In appearance he is fair, and is of a strong, broad build; he has almost a chubby face which, when he is in a gay mood, beams with kindly expression, his eyes twinkling, and his whole face becoming suffused with smiles. His manner is very genial, but on formal occasions, or at public ceremonies, he has a courtly and rather foreign carriage. When roused, and in argument about politics or art, his voice becomes raised and his eyes kindle with fire; at these times the spectator is struck with the great decision of character which is accentuated by the lines of the square forehead and the firmly drawn jaw, the fullness of the lips, and the set of the head."

MR. RUSKIN AND MODERN PROBLEMS.

MR. E. T. COOK, editor of the *Westminster Gazette*, contributes to the *National Review* a very full paper on "Mr. Ruskin in Relation to Modern Problems." Mr. Cook is a noted Ruskinian, but is by no means an uncritical admirer. He sets out to explain the paradox of Mr. Ruskin's wholesale condemnation of modern men, and the devotion he has drawn from so many of them. He finds the reasons in "the extreme and even morbid sensitiveness of the man" and his consequent irritability; in his discursiveness, which leads into an extraordinary variety of multifarious pursuits; in his love of irony and paradox, which demands "some sense of humor and faculty of discrimination" in his readers.

ECONOMICS NOT HIS PROPER WORK.

Mr. Cook does not hesitate to declare of Mr. Ruskin that: "His work in politics and economics is *not his proper work*—not the work for which he was best equipped, or in which he found his pleasure and his true vocation. His proper work was the practice and criticism of art. His economics have been a work by the way. In this fact we have a further explanation, I think, of its incompleteness of treatment, as well as of its impatience and petulance of tone. The man who makes some one subject the work of his life can afford to work and wait in patience. But Mr. Ruskin despatched himself as his "own special commissioner" to a foreign field, charged with the duty of finding an instant solution. His incursion into political economy was the payment, as it were, of 'ransom.' 'I want,' he says in one of his economic books, 'to disburden my heart of the witness I have to bear, in order that I may be free to go back to my garden lawns and social buds and flowers there.' He wanted to go and come back—bringing the millennium with him, and when the millennium tarried, terrible was the vexation of his soul . . . Mr. Ruskin is essentially a political idealist, rather than a practical politician, and much of his economic and political writing is confessedly Utopian."

"WE ARE ALL RUSKINIANS NOW."

Nevertheless his work lies in close practical relation with present-day movements. Mr. Cook recalls, in proof, the Seven Points advanced in the preface to "Unto this Last." "Men of all parties are, in fact, combining or competing to give practical effect to Mr. Ruskin's doctrine that the State should recognize 'soldiers of the ploughshare as well as soldiers of the sword.'" Among many other correspondences, Mr. Cook mentions that "In the earlier volumes of 'Fors Clavigera (1871-74), he insisted strongly on the necessity for fair rents, fixity of tenure, and compensation for improvements. He gave the landlords until 1880 to set their houses in order," and in 1881 the Irish Land act was passed. The preservation of footpaths and access to mountains he has also stimulated.

Sir William Harcourt, says Mr. Cook, might well declare, "We are all Ruskinians now."

CLEMATIS AND IVY.

Unpublished Letters of George Eliot.

MOST prominent among the contributions to the current number of *Poet Lore* is "Clematis and Ivy: a Record of Early Friendship," which is further explained as extracts from unpublished letters of George Eliot. Three installments of these letters will be published, and Mr. Wm. G. Kingsland, who has procured them for *Poet Lore*, writes: "These letters of George Eliot's are very interesting, and there is no doubt as to their authenticity. They have been in the hands of the lady to whom they were addressed until a year or so ago, when her representative sold them for a goodly number of pounds sterling, and no extracts have as yet been published; indeed, until they were sold their existence was unknown."

On September 17, 1840, George Eliot, writing to Miss Lewis, says: "You must know I have had bestowed on me the very pretty cognomen of *Clematis*, which in the floral language means 'mental beauty.' I cannot find it in my heart to refuse it, though, like many other appellations, it has rather the appearance of a satire than a compliment."

The writer did not mention that she too has designated the bestower by a like "pretty cognomen," no hint being given in her letter to Miss Lewis that among her friends was a certain "Patty," whom it delighted her to call "Ivy." But so it was, and Clematis and Ivy wrote to each other of their joys and sorrows, aspirations and desires, with no anticipation on the part of either that in due course Clematis would be in the front rank of English novelists, and that after the lapse of some fifty-three years, sixteen of her letters to Ivy would be sold to a London *littérateur*. They are written on thin gilt-edged paper, all in the handwriting of George Eliot, some few of them signed "Mary Ann," or "Mary Ann Evans," and the rest "Clematis."

The following letter, continues Mr. Kingsland, shows that life was full of meaning to this woman, even in her teens, and it is a fair sample of the rest:

The Bower of Clematis, July 30, 1840.

My Dear Ivy.—If you knew how the tendrils of your Clematis have been twisted out of their natural inclination, you would not wonder that she should concentrate all her sap for her own support under this rack-like process, and thus become stunted instead of stretching out a branch to clasp even her Ivy. At length, however, she invites her fellow-creeper (rather humbling by-the-by that they must both be called *parasitic* plants) to try whether the same soil and air will suit the constitution of each. Without all travesty, dear Patty, if you can venture an experiment on Griff and its presiding nymph, I shall be glad to welcome you hither. . . . There is an enchanting air of mystery about your note, dear Ivy. You thought, I suppose, that you had shrouded your secret in the fashion of a Turkish lady, but I can tell you it wore only the thin gauze that tempts one to pry more closely. So some lord of the forest, some giant oak or elm, has discovered that Ivy has just the qualifications to make wedded bliss more than a dream! I perfectly agree with his oakship—for what should a wife be if not faithful, devoted, clinging to the last, even when the rich boughs that make

the oak's beauty in the eyes of all beside are leafless and withered? And what, moreover, if not of vigorous and fibrous mental contexture, conjoined with apparent fragility, lightness and elegance? Shall I not do to write your epithalamium? . . . Come and blow on me and wrench the sorrowful weeds that nearly choke my stream. Send me that honeyed word Yes, and you will gladden your drooping

CLEMATIS.

THE INCARNATION OF ENGLISH DISSENT.

"GEORGE ELIOT was the living incarnation of English Dissent." So declares Madame Belloc in a most interesting comparison, contributed to the *Contemporary*, of "Dorothea Casaubon and George Eliot."

"She had 'Chapel' written in every line of the thoughtful, somewhat severe face; not the flourishing Dissent of Spurgeon or Parker, or the florid kindliness of Ward Beecher, or the culture of Stopford Brooke, but the Dissent of Jonathan Edwards, of Philip Henry, of John Wesley as he was ultimately forced to be. Her horror of a lie, her unflinching industry and sedulous use of all her talents, her extraordinary courage—even her dress, which, spend as she might and ultimately did, could never be lifted into fashion, and retained a certain quaint solemnity of cut and gesture like an eighteenth century diction applied to clothes—everything about her, to me, suggested Bunyan in his Bedford prison, or Mary Bosanquet watched by Fletcher of Madeley as she bore the pelting of the stones in the streets of Northampton. No one has ever before said this, so far as I know; no one has ever attempted to describe her as I saw her in her younger years, but I think I saw the truth."

Referring to her relations with Mr. Lewes, Madame Belloc proceeds: "That George Eliot should have chosen her own part and created in her own mind a moral code which covered her action—that I can understand. It would be unjust to judge her by a Christian law which she repudiated. But why, in the exercise of this amount of moral liberty, she should have idealized and finally almost worshiped Mr. Lewes, is one of those problems before which those who know the inner wheels of London life in the Fifties may well stand confounded."

AN interesting article in the *Young Man* is the beginning of Rev. George Jackson's account of his visit to Kirriemuir, the original, as most people now know, of Mr. Barrie's famous "Thrums." But, as Mr. Jackson remarks, Thrums is now hardly the town of which Mr. Barrie wrote. It has overflowed its old borders, and has "quite a thriving, modern look with its big mills and elegant villas dotted here and there." Still, however, it is possible to find the old landmarks, to see the old scenes, and side by side in the article with the pictures of Kirriemuir, as it now is, are photographic reproductions of Mr. Barrie's birthplace, the "Window in Thrums" itself, and Auld Licht Manse. An excellent portrait of the author of "The Little Minister" accompanies the article.

THE REAL STONEWALL JACKSON.

IN fine contrast with the customary apocryphal "anecdotes" of Stonewall Jackson, bearing the evidence of falsity on their face, is the straightforward paper on the great general which the February *Century* prints, over the name of D. H. Hill, the late Confederate officer. Indeed, this is easily the best thing that has been written about Jackson since the article in the same magazine some years ago by the poetess Margaret J. Preston, Jackson's sister-in-law. We quote several paragraphs from General Hill, who knew "Stonewall" very intimately for seventeen years.

Jackson was not a religious man until some ten years before his death, when he came to Lexington, Virginia, as a professor of philosophy in the Virginia Military Institute. Some earnest men in that charming old Presbyterian town interested Jackson's sincere nature in the articles of their faith, and the task was completed summarily by the young lady whom he fell desperately in love with and married—the daughter of a Presbyterian clergyman. General Hill dwells much on Jackson's iron will and Spartan devotion to duty, which qualities were developed to a wonderful degree in him.

A CONFIRMED DYSPEPTIC.

He had need of them, for his life was not an easy one, nor did he make friends easily. Indeed, he was one of the most unpopular men of the town during his professional career. He was awkward, diffident and uncompromising when discipline was at stake. He was a wretched speaker, but set his indomitable will on becoming a good one, in which he succeeded after the most desperate work and the endurance of much derision.

"When Jackson first came to the Virginia Military Institute he was a dyspeptic and something of a hypochondriac. His health was bad, but he imagined that he had many more ailments than he really did have. He had been at a water-cure establishment in the North and the prescription had been given him to live on stale bread and buttermilk and to wear a wet shirt next his body. He followed these directions for more than a year after coming to Lexington. Boarding at a public hotel, these peculiarities attracted much attention, and he was much laughed at by the rude and coarse. But he bore all their jests with patience and pursued his plan unmoved by their laughter. In like manner he carried out strictly the direction to go to bed at nine o'clock. If that hour caught him at a party, a lecture, a religious exercise or any other place, he invariably left. His dyspepsia caused drowsiness and he often went to sleep in conversation with a friend, and invariably, without exception, went to sleep at church. I have seen his head bowed down to his very knees during a good part of the sermon. He always heard the text of our good pastor, the Rev. Dr. White, and a few of his opening sentences. But after that all was lost."

"I think that his conduct in this case," says General Hill, speaking of the oratorical struggles, "was partly

due to a determination which he had made in early life to conquer every physical, mental, and moral weakness of his nature. As an illustration of this, he once told me that when he was a small boy it was necessary to put a mustard plaster upon his chest, and his guardian mounted him on a horse to go to a neighbor's house, so that his mind might be diverted and the plaster kept on. He said that the pain was so dreadful that he fainted soon after dismounting. I asked if he had left it on in order to obey his guardian. He answered, no; it was owing to a feeling that he had from early childhood not to yield to trials and difficulties."

AN UNUSUAL QUALITY OF BRAVERY.

"As he was passing by the tall institute building one day, a vicious and cowardly cadet, who hated him, let drop a brick from the third-story window. It fell close by his feet and his escape was almost miraculous. He did not deign to look up, and stalked on with contemptuous indifference. He brought charges against a cadet for some misdemeanor and got him dismissed. The cadet was a daring and reckless character, and challenged him, accompanying the note with the message that if the professor failed to give him satisfaction in that way he would kill him on sight. Jackson brought the challenge to me and asked my advice in regard to swearing the peace against the cadet. I vehemently opposed it on the grounds that the cadets would always regard him as a coward, and that he would be annoyed by their contemptuous treatment. He heard me through patiently, thanked me for my advice, went straight to a magistrate and swore the peace against the cadet. There was a perfect hoot of derision in the town, in Washington College and in the institute. A military man, who had distinguished himself on the plains of Mexico, had taken an oath that he was in bodily fear of a mere stripling. But the end was not yet. The officer of the law was afraid to serve the writ on the young desperado, who easily kept out of his way. Jackson had rooms in the institute building. He went in and out as usual, both day and night. The dismissed cadet told his comrades that he would attack Jackson at a certain hour one day, but he did not. The time was changed to that night, to the next day, to the next night. But the attack never came, and the boys discovered that the blusterer was afraid of the man who had sworn the peace against him, and they turned their derision from the professor to their comrade. The explanation of his conduct was this: Jackson had let it be known that as a Christian he felt it to be his duty to avoid a difficulty, and therefore had gone to an officer of the law for protection. That failing, he had felt it to be a duty to protect himself, and had prepared himself for a personal affray. The cadet had seen the flash of that blue eye and knew that the result of a collision would be fatal to himself. I have thought that no incident in the life of Jackson was more truly sublime than this. He was unmarried, a comparative stranger, with but few friends. He was ambitious,

covetous of distinction, desirous to rise in the world, sensitive to ridicule, tenacious of honor,—yet, from a high sense of Christian duty, he sacrificed the good opinion of his associates, brought contempt upon his character as a soldier and a gentleman, and ran the risk of blighting his prospects in life forever. The heroism of the battle-field, yea, the martyr courage of the stake, are nothing to this."

THE IDOLATRY OF HIS SOLDIERS.

But this all changed when he became the successful soldier, known and admired over the whole civilized world. His soldiers idolized Jackson, and eleven thousand Federal prisoners cheered him like mad at Harper's Ferry. And yet he changed nothing in his uncongenial manners, and General Hill even says that his lieutenants were often sadly handicapped by their general's silence in regard to his plans and their consequent inability to co-operate. The noisy demonstrations with which his troops always greeted him were very embarrassing to Jackson, this biography tells us, partly because he was so thoroughly modest, and partly because it offended his religious sense that they should depend so much on one man rather than on their Creator. General Hill gives it as his opinion that Jackson's popularity existed in spite of his personality, and almost entirely because of his dashing success in battle, with a mingling of awe felt by those around him on account of his solemn communings with Heaven.

JAN VAN BEERS AT HOME.

MISS BELLOC supplies an interesting sketch to the *Idler* of the popular "Meissonier des Dames." "Jan Van Beers the man," she tells us, "as apart from Jan Van Beers the artist has a remarkable personality. His lithe, well-turned figure and sensitive, clear-cut face cannot but remind those who see him for the first time of some of the portraits of the kingly Valois hanging in the Château of Versailles, and as he leads you through a darkened hall, from whose tapestried walls grin strange mediæval grotesques and Eastern masks, it is hard to realize that here, indeed, were both conceived and executed the brilliant little counterfeit presentments of modern Parisian life which his name evokes, whichever side of the globe it be mentioned."

The reason which led him to turn from his earlier work of historical painting and to become the limner of *la vie Parisienne*, he announces with the utmost candor: "Painting great pictures is all very well, but they will not make the pot boil. I generally spent more over my historical studies than the price they fetch when completed, and, besides, I confess that I thoroughly enjoyed painting a pretty woman, and nowhere in the world will you find such paintable subjects as in Paris; even the plainest Parisienne has about her something charming."

His models are drawn from the most varied sources. Parisian ladies, grisettes, English and Americans, are beguiled into the studio. His new house in the Bois de Boulogne is, with somewhat naïve vanity, described

by him as a treasure-house of art, beauty and wealth, which might have made King Solomon envious.

A NEW EDISON ON THE HORIZON.

IN the February *Century* Mr. T. C. Martin tells of the young Servian, Nikola Tesla, who has come to the New World to make what amounts to a revolution in many world-important departments of electrical invention. Mr. Tesla is only thirty-six years old, and, like Edison, has achieved his triumphs in the face of extreme poverty and other adverse influences. One of the most important of his inventions has had to do with the polyphase currents, on the principle of which large powers are "transmitted electrically more than a hundred miles from Neckar-on-the-Rhine to Frankfort-on-the-Main; and now, by equivalent agency, Niagara is to drive the wheels of Buffalo and beyond."

Mr. Martin tells of other marvelous discoveries of the young Servian:

"Broadly stated, Mr. Tesla has advanced the opinion, and sustained it by brilliant experiments of startling beauty and grandeur, that light and heat are produced by electrostatic forces acting between charged molecules or atoms. Perfecting a generator that would give him currents of several thousand alternations per second, and inventing his disruptive discharge coil, he has created electrostatic conditions that have already modified not a few of the accepted notions about electricity. It has been supposed that ordinary currents of one or two thousand volts' potential would surely kill, but Mr. Tesla has been seen receiving through his hands currents at a potential of more than 200,000 volts, vibrating a million times per second, and manifesting themselves in dazzling streams of light. This is not a mere *tour de force*, but illustrates the principle that while currents of lower frequency destroy life, these are harmless. After such a striking test, which by the way, no one has displayed a hurried inclination to repeat, Mr. Tesla's body and clothing have continued for some time to emit fine glimmers or halos of splintered light. In fact, an actual flame is produced by the agitation of electrostatically charged molecules, and the curious spectacle can be seen of puissant, white, ethereal flames that do not consume anything, bursting from the ends of an induction coil as though it were the bush on holy ground. With such vibrations as can be maintained by a potential of 3,000,000 volts, Mr. Tesla expects some day to envelop himself in a complete sheet of lambent fire that will leave him quite uninjured. Such currents as he now uses would, he says, keep a naked man warm at the North Pole, and their use in therapeutics is but one of the practical possibilities that has been taken up.

"Utilizing similar currents and mechanism, Mr. Tesla has demonstrated the fact that electric lamps and motors can not only be made to operate on one wire, instead of using a second wire on the ground to complete the circuit, but that we can operate them even by omitting the circuit. Our subway boards are to find their

wires and occupations gone. Electric vibrations set up at any point of the earth may by resonance at any other spot serve for the transmission of either intelligence or power. With these impulses or wave discharges, Mr. Tesla also opens up an entirely new field of electric lighting. His lamps have no filaments as ordinarily known, but contain a straight fiber, a refractory button, or nothing but a gas. Tubes or bulbs of this kind, in which the imprisoned ether or air beats the crystal walls, when carried into the area or room through which these unsuspected currents are silently vibrating, burst into sudden light. If coated inwardly with phosphorescent substances, they glow in all the splendors of the sunset and the aurora."

CHICAGO'S GREATEST MILLIONAIRE.

ARTHUR WARREN contributes to the February *McClure's* an excellent character sketch of Philip D. Armour, for whom he has naught to say but that breathes admiration—an admiration which he convinces his readers is not because Mr. Armour is the richest man in Chicago.

HE COMMANDS AN INDUSTRIAL ARMY.

"Mr. Armour is not a mere speculator, or, as the ambiguous giving out of the exchanges has it, an 'operator' in the necessities of life. He is something more than the richest man in Chicago; he is perhaps the greatest trader in the world. But that is not all. He is one of the greatest manufacturers in this or any other country. In this capacity alone he employs twelve thousand persons, pays six or seven millions of dollars yearly in wages, owns four thousand railway cars which are used in transporting his goods, and has seven or eight hundred horses to haul his wagons. Fifty or sixty thousand persons receive direct support from the wages paid in his meat-packing business alone, if we estimate families on the census basis. He is a larger owner of grain elevators than any other individual in either hemisphere; he is the proprietor of a glue factory which turns out a product of seven millions of tons a year, and he is actively interested in an important railway enterprise."

HIS PERSONALITY AND HABITS.

"Armour is in every way a large man—large in build, in mind, in nature. He is nearly six feet high, with a kind of stately bulk which turns the scales at something like two hundred and fifty pounds. He moves easily, but he thinks in flashes. He has a big, powerful head, broad over the eyes, and dome-shaped, a head that is full of character and determination. He has the strongest, and at the same time the sweetest, face that I have ever seen in a man. It is the face of one who is so much the master of himself that he can afford to be gentle. His voice is kindly in its tone and low, and while his eyes twinkle and around them are the lines of good humor, there is in them all the shrewdness, all the searching quality that you can imagine a man of his record to possess. They are the eyes of an analyst of human nature."

EARLY TO BED AND EARLY TO RISE.

Mr. Armour gives this account of his simple daily regimen.

"A man must master his undertaking, and not let it master him. He must have the power to decide quickly, even to decide instantly, on which side he is going to make his mistakes. As for application, no great thing is done without that. In my own case, I have carried into business the working habits I learned as a boy on a New York farm. All my life I have been up with the sun. The habit is as easy at sixty-one as it was at sixteen; perhaps easier, because I am hardened to it. I have my breakfast by half-past five or six; I walk down town to my office and am there by seven, and I know what is going on in the world without having to wait for others to come and tell me. At noon I have a simple luncheon of bread and milk, and after that, usually, a short nap, which freshens me again for the afternoon's work. I am in bed again at nine o'clock every night."

WHITCOMB RILEY AS A SIGN PAINTER.

IN the "Real Conversation" which Hamlin Garland conducts with the Hoosier poet in the February *McClure's* some funny reminiscences of the latter's early life came out. After traveling as a patent medicine drummer Mr. Riley "went into partnership with a young fellow to travel, organizing a scheme of advertising with paint, which we called 'The Graphic Company.' 'We had five or six young fellows, all musicians as well as handy painters, and we used to capture the towns with our music. One fellow could whistle like a nightingale, another sang like an angel and another played the banjo. I scuffled with the violin and guitar.'

"I thought so, from that poem on 'The Fiddle' in 'The Old Swimmin' Hole,'" says Mr. Garland.

"Our only dissipation was clothes. We dressed loud. You could hear our clothes an incalculable distance. We had an idea it helped business. Our plan was to take one firm of each business in a town, painting its advertisements on every road leading into the town: 'Go to Mooney's,' and things like that, you understand. We made a good thing at it.'

"How long did you do business?"

"Three or four years, and we had more fun than anybody.' He turned another comical look on me over his pinch-nose eyeglasses. 'You've heard this story about my traveling all over the State as a blind sign painter? Well, that started this way. One day we were in a small town somewhere, and a great crowd watching us in breathless wonder and curiosity; and one of our party said: 'Riley, let me introduce you as a blind sign painter.' So just for mischief I put on a crazy look in the eyes and pretended to be blind. They led me carefully to the ladder, and handed me my brush and paints. It was great fun. I'd hear them saying as I worked, 'That feller ain't blind.' 'Yes, he is, see his eyes.' 'No, he ain't, I tell you, he's playin' off.' 'I tell you he *is* blind. Didn't you see him fall over a box there and spill all his paints?'"

THE AGE OF THE EARTH.

IN the valuable little symposium of scientific discussion which the *Cosmopolitan* prints monthly under the title "The Progress of Science," Mr. George F. Becker tells of the various estimates the great scientists have made of the age of the earth.

PROBABLY NOT OVER ONE HUNDRED MILLION YEARS.

"When geologists discovered that the history to be read in the stratified rocks extended over a period compared with which the traditional six thousand years was almost insignificant, there was a natural tendency to claim for the length of geological periods any lapse of time which might seem convenient. It was Lord Kelvin (then Sir William Thomson) who first adduced valid physical arguments to show that, on any reasonable assumptions as to the mean temperature of the globe prior to its consolidation from complete or partial fusion, the time which has elapsed since that epoch could scarcely be more than about one hundred million years. Then Baron von Helmholtz gave the first logical explanation of the sun's heat together with an estimate of its age, which turns out about a score of million years, supposing that the emanation of heat has been correctly determined. The geologists are much divided in opinion on this vital subject. Some of the most distinguished of them have protested that even one hundred millions was far too short a time to allow for the development of species, or for the accumulation of sediments. Others of no less ability see their way to accepting figures of from twenty to a hundred millions of years as the probable age of the earth. Mr. Clarence King early in the year presented an argument somewhat similar to Lord Kelvin's, but based on different experimental evidence and postulating a solid earth. He reached twenty-four million years as the result. The veteran Professor Prestwich, too, in reviewing the assumptions of uniformitarianism has announced his opinion that fifteen or twenty million years is much more probable than three hundred million. Again, Mr. C. D. Walcott, from a study of the strata on the Pacific slope, concludes that forty-five million years since the data of the earliest known fossils is a fair average estimate. Other absolute estimates and estimates in terms of some particular formation have also been made which bring the age within Kelvin's period.

GEOLOGY'S DEBT TO PHYSICS.

"There can be no question that geology owes a great debt to physics for putting a limit on the extravagant assumptions as to the earth's age, which have been current. It is true that neither geologists nor physicists have accurate data from which to compute, yet the ingenuity which both parties have displayed has been useful in a two-fold sense. It has been shown that each group of thinkers, arguing from different premises, may reach results not utterly discordant; and in doing so they have developed methods of discussion which will be useful in reaching a final conclusion when better data become available."

THE PERIODICALS REVIEWED.

THE NORTH AMERICAN REVIEW.

IN the preceding department will be found extended reviews of Governor Tillman's report upon the workings of the South Carolina Liquor Law and Sir John Lubbock's article "The Income Tax in England."

PRESIDENT FREY'S AMERICAN EXPERIENCES.

M. Emil Frey, the new President of the Swiss Republic, relates his experiences as a farmer boy and later as a soldier in the United States. He came to America in 1860, and took a place with a farmer living near Highland, Madison County, Ill. When the war broke out he enlisted in the Union Army, and in his article he tells many interesting incidents connected with his experiences in the field and during his confinement in Libby Prison. At the close of the war he returned to Switzerland, where he engaged in editorial work, conducting one of the largest and most popular daily journals, the *Basler Nachrichten*, and soon became an active factor in the so-called social or progressive democracy, being repeatedly elected to Congress, and serving for one term as Speaker of the House of Representatives or National Council. When, in 1882, it was decided to establish a diplomatic mission at Washington, M. Frey was unanimously selected as Swiss Minister to the United States. On his return to Switzerland in 1887, he was at once re-elected to Congress, and was subsequently elected a member of the Executive Council and assigned as Chief of the Military Department. He was next chosen Vice-President of the Federal Council, and at the annual election held last year by the Federal Assembly was elected President of the Swiss Confederation.

SINGLE TAX AS A CURE FOR SCARCITY OF EMPLOYMENT.

This is Mr. Henry George's suggestion for helping the unemployed: "The country is suffering from 'scarcity of employment.' But let any one to-day attempt to employ his own labor or that of others, whether in making two blades of grass grow where one grew before, or in erecting a factory, and he will at once meet the speculator to demand of him an unnatural price for the land he must use, and the tax-gatherer to fine him for his act in employing labor as if he had committed a crime. The common-sense way to cure 'scarcity of employment' is to take taxes off the products and processes of employment and to impose in their stead the tax that would end speculation in land."

ARE WE A PLUTOCRACY?

Mr. William Dean Howells, discussing the question "Are We a Plutocracy?" gives evidence which goes to show that we are, and concludes that "if the poor American does not like it, or if he does not prefer a plutocracy to a democracy, he has the affair in his own hands, for he has an overwhelming majority of the votes. At the end, as in the beginning, it is he who is responsible, and if he thinks himself unfairly used, it is quite for him to see that he is used fairly; for, slowly or swiftly, it is he who ultimately makes and unmakes the laws, by political methods which, if still somewhat clumsy, he can promptly improve. It is time, in fine, that he should leave off railing at the rich, who are no more to blame than he, who are perhaps not so much to blame, since they are infinitely fewer than the poor and have but a vote apiece, unless the poor sell them more. If we have a plutocracy it may be partly because the rich want it, but it is infinitely more because the poor choose it or allow it."

THE FORUM.

IN another department we have reviewed at length four articles appearing in the current *Forum*: "Methods of Relief for the Unemployed," by Josephine S. Lowell; "The Personal Problem of Charity," by Rev. Dr. Lyman Abbott; "Review of the Hawaiian Controversy," by Mr. James Schouler, and "To Rob Consumption of Its Terrors," by Dr. H. M. Biggs.

THE WORLD'S PRODUCTION OF GOLD IN 1893.

In an article on the production of gold, Mr. J. E. Fraenkel states that it will be found that the world's production of gold for 1893 was \$148,000,000, divided as follows: "United States, \$35,000,000; Australia, \$25,000,000; South Africa, \$30,000,000; Russia, \$25,000,000; India, \$4,000,000; China, \$3,000,000; other countries, \$16,000,000. This is an increase of more than \$17,000,000 over the figures of the Director of the Mint, and \$10,000,000 over our figures, for 1892. The probabilities are that even this estimate is too low, as a much larger increase is expected in the United States and Australia, and from a semi-official source we learn that the Bureau of the Mint estimates the production of gold for 1893 at \$150,000,000." The only country which promises to increase its yield with any degree of certainty is South Africa.

LINCOLN THE SUPREME AMERICAN.

Professor Woodrow Wilson, of Princeton University, makes a "Calendar of Great Americans," in which he sums up in a paragraph or page, as the case may be, the claims to greatness of the dozen men whom he names. While acknowledging the greatness of Hamilton and Madison, Prof. Wilson recognizes that they were really Englishmen, while John Adams and Calhoun were great Provincials rather than great Americans. Jefferson is refused the title because, though a giant, his thought was permeated and weakened by the French philosophy.

Benjamin Franklin was American to the last degree, as was the real Washington—not as his biographers have depicted him, and Henry Clay and Andrew Jackson.

"Lincoln, nevertheless, rather than Jackson, was the supreme American of our history. In Clay, East and West were mixed without being fused or harmonized: he seems like two men. In Jackson there was not even a mixture; he was all of a piece, and altogether unacceptable to some parts of the country—a frontier statesman. But in Lincoln the elements were combined and harmonized. The most singular thing about the wonderful career of the man is the way in which he steadily grew into a national stature. He began an amorphous, unlicked cub, bred in the rudest of human lairs; but, as he grew, everything formed, informed, transformed him. The process was slow but unbroken. He was not fit to be President until he actually became President. He was fit then because, learning everything as he went, he had found out how much there was to learn, and had still an infinite capacity for learning."

THE NICARAGUA CANAL—OURS OR ENGLAND'S?

Mr. Courtenay DeKalb, who has traveled extensively in Central and South America, writing on the subject "The Nicaragua Canal—Ours or England's?" declares that the American people must answer this question before the beginning of another year, and that the answer involves to-day, as it did forty years ago, a choice between the alternatives of American or British control of the highways to the Pacific Ocean.

THE CONTEMPORARY REVIEW.

THE *Contemporary* contains many weighty articles in theology, philosophy, and finance, but there is also much matter of a lighter and more distinctively literary cast; Dr. Dillon's connection of Ecclesiastes with Buddhism; Mr. W. S. Lilly's discursive philosophy of crime and Madame Belloc's study of George Eliot through her "Dorothea Casaubon," have received separate notice.

Mr. Costelloe voices the bitter cry of the London ratepayer, and enforces with a formidable array of argument the case for betterment.

AUSTRALASIAN FINANCE.

Mr. Norwood Young defends Australasian finance against the attacks of the *Investors' Review*, and avers that "the general effect of Australasian borrowings has been to increase the produce of the soil, as is shown by the great increase in exports, and thus to add directly to the wealth of these colonies.

"By his intense eagerness to lend and subsequent frantic demand for all his money back at an hour's notice the British money-lender has brought upon Australia the severest financial crisis on record in modern times. Yet there is solid ground for the belief that Australia is, at this moment, the most prosperous country in the whole world."

Rev. Brooke Herford, D.D., discussing the question of religious teaching in the Board school, argues from the example of Christ himself that "Christianity can be taught undogmatically."

THE NATIONAL REVIEW.

THE *National Review* continues steadily advancing in freshness and timeliness of interest. The February number offers a very attractive bill of fare. Notice has been taken elsewhere of Mr. Robert Beadon's story of the collapse of the Imperial Federation League, of Mr. E. T. Cook's lecture on Mr. Ruskin's relation to modern problems, and of Mr. St. Loe Strachey's appeal to the Lords to bring in a Referendum bill. Sir M. E. Grant-Duff, in reviewing Mr. Prothero's everywhere noticed "Life of Stanley," predicts that the Dean "will be remembered in Great Britain and in Greater Britain as the herald of a new reformation infinitely more beneficent than that of the sixteenth century." Mr. J. E. MacTaggart objects to the project of "a university in and for Wales." "The new institution," he augurs, "is to be learned if it can, but Welsh at all costs." It will not teach a single student; it will only grant degrees to students who come from its federated colleges. What need was there, then, of a Welsh college when the University of London is prepared to grant degrees to everybody she passes "with the impartiality of a stamping machine," and the Victoria University is able to affiliate the Welsh colleges? The writer objects to the local representation on the proposed university, and generally to its officially declared provincialism. Mr. Charles Edwardes draws a vivid and entertaining picture of Roman society a century ago.

THE MORAL OF MR. STANHOPE'S DEATH.

Mr. W. St. John Brodrick, M.P., reviews the public career of the late Mr. Stanhope, and argues that: "Unless we materially modify the conditions of Parliament, we shall not merely clip the career of some of our ablest men, but scare away the best recruits at the threshold of public life. Only political hacks can tolerate Parliament all the year round. . . . Continuous political action de-

teriorates mind and body alike, and if recent losses tend to convince the nation that politicians require a close time for thought and culture, men like Smith and Stanhope will not have given themselves in vain."

"THE LIVING WAGE."

Mr. Hugh Bell presents an analysis of the accounts of an industrial firm with which he is connected, and endeavors to show that "no manipulation of them would have produced better results to the men for whom they found employment, directly or indirectly." He is not prepared to say that there may not be better results in the future. "On the contrary, since I have been engaged in business, I have seen a continual rise in the wages earned by the men. . . . What cost 6s. in wages thirty years ago costs under 3s. to-day, and yet the wage of each individual man is higher than it was then and the gross wages infinitely larger than they were. What does this mean? Why, that better results have been obtained out of the individual man, and yet his labor has been lessened and his condition improved, and this has been accomplished chiefly by placing better tools in his hands. I regret to be constrained to say that in effecting this change little or no help has been rendered by the workmen."

THE NINETEENTH CENTURY.

THERE is no very eminent feature in this month's contents—perhaps Prof. Max Müller's defense of the Mahomedan heaven (noticed elsewhere) is the most striking contribution—but the other articles offer a great variety of information, stimulus and entertainment. Mr. Chauncey M. Depew sums up the "Prospects of Free Trade in the United States" by announcing that "a miracle can scarcely pass a measure which would materially alter the present law, and only a miracle can prevent the return of the Protectionists to power."

Sir W. Des Vœux, late Governor of Hong Kong, contributes "A Letter to the Opium Commission," in which he declares that though in early life he shared the usual British prejudice against opium, his experience has led him "by slow process of conviction from the accumulating evidence of years" to the belief that the suppression of opium consumption would be an evil rather than a good. Its place would be taken by a worse form of intoxicant. Hong Kong smokes more opium perhaps than any other town, yet Hong Kong, though exposed constantly to cholera and small pox, and extremely insanitary, has only a death rate of 22 per 1,000. Mr. Riegnald Brett supplies a delightful historical sketch of "The Queen and her Second Prime Minister," Sir Robert Peel.

CRUMBS FROM THE CRITIC'S TABLE.

Several "noticeable books" are appraised by eminent censors. Mr. Goldwin Smith, speaking on Mr. Prothero's *Life*, describes Dean Stanley as "a genuine hero," but declares that "his influence as a theologian and a religious philosopher has (*sic*) probably ceased." Mr. H. D. Traill characterizes Mr. Francis Thompson as "a seventeenth century rhapsodist born out of due time,"—least likely, therefore, to "set the fashion of the future," but for all that "a new poet of the first rank." Mr. W. S. Lilly ventures on the rather ponderous statement that "the great merit of the English prison system is that it, on the whole, accords with the dictates of nature and eternal fact." Mr. Theodore Watts finds the weakness, the charm unique and ineffable of Dumas in his juvenility: he "never reached intellectual manhood at all." Mr. Hamilton Aidé has discovered "remarkable powers"

of dramatic verse in a young American poet, Mr. Richard Hovey.

"Bores," history and species, are sketched with fine humor by Sir Herbert Maxwell. The ball which Mrs. Crackanthorpe started is kept a-rolling in a dialogue headed "Mothers and Daughters," by Mrs. Frederic Harrison, whose mouth-piece declares "we have to rebuild the family on a scientific basis, and to recast the family ideal."

There is much sonorous languorous music in Mr. Dudley C. Bushby's poem "Eleusinia."

THE NEW REVIEW.

THIS is a brightly varied number, comprising several articles of eminent worth, along with what may be termed curios in the magazine cabinet. Mr. Auberon Herbert's funeral oration over representative government, and Dr. Williamson's account of John Locke's pocket-book are noticed elsewhere. Mr. Walter Crane concludes his impressions of America by a swift succession of picturesque glimpses, which convey with singular vividness the sensation of rapid travel. Miss Belloc tells the story of the Théâtre Libre of Paris, with appreciations by MM. de Goncourt, Daudet, Le Maître, and Lanedau. Stepniak replies to the effort made in the previous issue to identify the bomb-throwing Anarchists with the Russian Nihilists. He declares that "the so-called Nihilists are not Anarchists. Anarchy died in Russia as long ago as 1874, and was practically buried in 1877." Mr. Gunnsberg, along with certain problems he sets in chess, tells a few short, striking chess anecdotes. Mr. Hubert Crackanthorpe's first installment of romance is pretty well all honeymoon.

THE FORTNIGHTLY REVIEW.

THE unique distinction of the current number is Mr. Herbert Spencer's memorial tribute to the late Professor Tyndall. Notice has been given elsewhere to this article, as also to the paper on "The Italy of To-Day."

OXFORD REVISITED.

Professor Goldwin Smith communicates his impressions of Oxford revisited in a lively and discursive style. As one who fought against the tests, he hails the trophies of victory in Manchester and Mansfield. He fears that Oxford is suffering from its own attractiveness and that academical society is being swamped by a non-academical influx. He remarks on the improved industry of students, and is impressed with the "somewhat slavish" homage paid to athleticism. "The most remarkable thing of all is the development of football." "Society is pervaded by a passion for amusement and excitement." He observes that the question is not yet settled whether Oxford is to be a mart of knowledge or a place of liberal culture.

A VANISHED CONTINENT.

Mr. Henry O. Forbes, proceeding on the law that "the areas inhabited by a given species, and in considerable measure likewise by the same genera, are or have been continuous with each other," infers the existence of "a vanished Austral land"—a continent connecting what are now the terminations of the great continents. "The boundaries of this continent of *Antarctica*, as I have proposed to designate it, would have united Patagonia, New Zealand, Tasmania with East Australia, and that old island-continent (joined, perhaps, by a narrow commissure, for a longer or shorter time, to East Africa), which

Dr. Schlater long ago named Lemuria, to a circumpolar land greater than at present by extensive independent peninsulas, between which the Atlantic, the Pacific and the Indian Oceans extended almost as far south as they do now."

REMBRANDT RESURGENT.

Forty years ago, says Mr. Walter Armstrong in an interesting study on the Dutch master, few would have put Rembrandt among the first half dozen painters of the world. Now he would probably head the poll, with Raphael, Titian and Velasquez as next in order of prominence. Rembrandt was "a man absolutely faithful to his own personality—a man governed through life by a single desire, that of giving the purest and most condensed expression to his own ideas." Mr. Armstrong remarks upon his shyness and self-centredness. Another curious fact is that as his genius reached its truest development he lost his popularity. His best work has taken nearly two hundred years to win the admiration it now enjoys.

Mr. W. H. Mallock, with great diffuseness of elaboration, condemns Fabian economics, among other reasons, for supposing that labor is the chief human agent in production, instead of counting ability as by far the most important factor.

THE WESTMINSTER REVIEW.

THERE are several articles of exceptional interest in the *Westminster Review*. Two may be selected for mention. A discussion of the coal question leads Hugh H. L. Bellot to urge that "the ownership of all mines and minerals should reside in the State, or in its delegates, such as county councils, district councils and municipalities; the title of the present owners should be reduced to that of possession only, and this possession should be individual or collective." He asks, "Why should not London, Manchester or Birmingham own their own mines and work them?"

Mr. W. Sullivan, criticising Cardinal Vaughan's pronouncements on the social question, doubts "the advantage of teaching a number of speculative tenets with little or no bearing on practical life, which are proposed and defended in an hundred ways by the divergent sections of Christendom, and generally discredited in the eyes of thinking men. They think that all this could go and the world be no poorer for its loss, and that the theological fringes industriously wrought about the grand central truths of the religion of Jesus Christ have little or no bearing on the great social questions of the day."

THE DUBLIN REVIEW.

THERE is much in this *Review* of great interest to other than Catholic readers. Rev. J. S. Vaughan's drastic scheme of graduated income-tax, Rev. L. C. Casartelli's summary of the history of burial, and Mr. Bruce's plan's for dealing with town fogs are noticed elsewhere. Mr. W. S. Lilly, in a review of Alexander Pope's works, observes that "from the time that William [III] was firmly established on the throne, the Government steadily discountenanced the persecution of Catholics." "It can hardly be doubted that to Pope must be attributed, in some degree, the ebbing of anti-Catholic prejudice." To the charge that Pope was merely a nominal Catholic, Mr. Lilly replies that he was "an extremely ill-instructed Catholic," and "as deficient in theological virtues as in theological instruction," yet "upon the whole worthy of admiration and regard, of reverence and affection," and "one of the most effective powers for good in English literature." Miss E. M. Clerke, writing on Mashonaland,

testifies that "priests and nuns have everywhere met with the greatest kindness from the officers of the company," and she rejoices in "the incorporation of the fair and fertile regions depopulated by Lobengula in the great oversea dominion of Britain." The Science Notes are full of glowing appreciation of Professor Tyndall's scientific work.

THE EDINBURGH REVIEW.

THE conspectus of fact and argument in support of the "Economy of High Wages," which is noticed elsewhere, is an article of exceptional and timely value. The place of honor is given to the first part of a review of the Memoirs of Chancellor Pasquier, who was a man before the great French Revolution broke out, who spent the next sixty years in conspicuous public life, and who lived on till 1862. His recollections of a period that stretched from the *ancien régime* to the decline of the Second Empire thus cover a series of the most motley changes. Recent editions of Tacitus call forth the remark that the historian's "grand elevation of moral dignity has never been surpassed." He "writes like a man who had never enjoyed a laugh." "But we fail to find in Tacitus the austere impartiality which is superior to the bias of personal feelings strongly enlisted." The last campaign of Montrose is made the occasion of a warm eulogy on the unfortunate general; "Montrose was the Milton of the battlefield." On the "Addresses of the Late Earl of Derby," the reviewer observes that his lordship "was not afflicted with the perilous facility of unpremeditated oratory, which speaks so much and says so little," but that "whatever he thought it worth while to say, he prepared with great reflection and labor." The political review of the Session of 1893 is disappointing. In a quarterly *chronique* one looks for something more than a spicy rehash of what one has seen over and over again in daily and weekly partisan prints.

MODERN ITALIAN LITERATURE.

The popular literature of modern Italy is presented in interesting, though rather sombre, hues. The reviewer regrets that the "passion for dwelling on morbid and unwholesome themes, on moral and physical putrefaction," is "a taste which appears to have impregnated the literature and the art of the present day in Italy." He describes Signor Gabriele D'Annunzio as "incomparably the greatest stylist of the modern Italian school." "Signor Verga is a real artist." Signor Salvatore Farina has been called the "Dickens of Italy." "Humor is not a common quality in Italy."

"The literary talent of the present day in Italy is at its best in sketches and short stories. It is, in short, an impressionist school. But the general feeling we derive from these varied pictures of Italian life is a melancholy one, indicating that national independence and liberty have not brought happiness, prosperity or contentment to the people."

WHAT THE CRUSADES DID FOR EUROPE.

The results of the Crusades are set in a new light. The Crusades were of value not simply as an occasion for union and for needed disillusionment in religion; they really put the West to school in the East. "In Italy and Spain, first, and afterwards in France, the philosophy and science of the Moslems and of Aristotle were studied. . . . The art and culture of Venice, Genoa and Pisa were almost entirely of Oriental origin. . . . The roots of the Renaissance are found in the civilization of

the Crusades. The wise laws of the Latin kingdom set an example not vainly placed before great kings like St. Louis, Richard Lion Heart, or Edward I. The wider thought which resulted from a wider knowledge of ancient philosophies, of varying Christian beliefs, of Moslem simplicity and Buddhist tolerance, led to the birth of that free spirit of inquiry which rejected the discredited authority of Rome. Peter the Hermit preached unconsciously a far-distant reformation. Frederic II laid the foundations of European science. . . . The history of the kingdom of Jerusalem is the history of the birth of freedom for all Europe."

THE SCOTTISH REVIEW.

THE summaries of foreign reviews—German, Russian, Italian, French, Swiss, Spanish and Dutch—form an important addition to the high worth of the *Review*.

THE ORIGIN OF ALL THE ALPHABETS.

Major Conder, writing on the "Antiquities of Cyprus," states that the Cypriote character, on recently discovered inscriptions, is not alphabetic, but consists of a syllabary of fifty-three sounds:

"It was originally used for a non-Aryan language, which on other grounds is determined as having been Mongolic. The syllabary did not originate in Cyprus, and it was used by the Carians on the mainland to the north. It appears to furnish the early forms from which originated the alphabets of Phœnicia and Greece and Lycia, a view which is slowly winning acceptance among scholars. The Cypriote syllabary is thus the origin of all the alphabetic scripts that have ever existed, for the Phœnician alphabet is the parent of them all (as is well recognized by epigraphists), and superseded the clumsier Cuneiform and Egyptian systems."

The dramatic rendering every Palm Sunday of the raising of Lazarus is supposed to perpetuate under Christian forms the old spring festival of the resurrection of Adonis.

Dr. Wenley's criticism of Professor Edward Caird's "Evolution" claims special attention elsewhere.

THE LONDON QUARTERLY REVIEW.

THE January number is bright, timely and lively, so far as these qualities are compatible with the dignity and solidity of a mainly theological review. Perhaps the most interesting of its seven major articles is that on "John Ruskin: a Study in Development," as sympathetic as it is reverent. "Lowell's Letters" are happily reviewed, special attention being paid to his, as to Mr. Ruskin's, religious progress. The first place is given to an article on Dr. Pusey's life and life-work. The writer freely grants that "no saint of the Romish Church has ever been more devoted or led a more consecrated life," but holds Dr. Pusey responsible for the wide spread of the "prime and deadly element of popery," which drives the soul conscious of guilt to the priest and the confessional. The reviewer of Dr. Bruce's Apologetics is much grieved with the statement, "Jesus has the value of God for us," and asks, somewhat warmly, "But is He God or not?" He describes it as Ritschlian phraseology, and roundly says: "In plain English Ritschlianism is Unitarianism." An article on Mashonaland strongly reprobates the conduct of Lobengula and applauds "the wisdom and vigor" of Mr. Rhodes. An article on "People's Banks" commends, as a task by which our aristocracy might work out their social salvation, "the organization of credit for the million."

THE QUARTERLY REVIEW.

THE new number contains a very wide variety of high class articles. That on "Anarchist Literature," which, with the "Stewardship of the Chiltern Hundreds," is noticed elsewhere, is perhaps the most striking contribution of recent months to British periodical literature.

THE PERIL OF PARLIAMENT.

The peril of Parliament, from the want of space, manners, and orderly dispatch of business in the House of Commons, is solemnly enlarged upon. The reviewer declares that "the greater the number of social classes that are represented in Parliament, the better: the direct representatives of labor, as the members who have been workingmen are called, are, with scarcely an exception, quiet, orderly, and excellent men of business, who entertain a genuine respect for the traditions of the House. The difficulty and danger come from the representatives of disaffection and the representatives of themselves."

To prevent the abuse of the guillotine, the writer suggests that more discretionary power be put in the hands of Speaker and Chairman. But his chief reliance seems to be upon the Second Chamber. He strongly denounces the new bribery of unlimited promises of legislative assistance to the electors. Mr. Diggle and his friends should take note of his plea for the teaching of elementary political economy in the Board schools.

GOOD-BYE TO THE "GLACIAL AGE."

The reviewer of Sir Henry Howorth's work on "The Glacial Nightmare" considers that "in his treatment of the rival claims of ice and of water, as to which was the chief factor in producing the great Drift at the close of the Pleistocene epoch, the author has succeeded in shifting the balance of probability, and transferring it to the action of the latter."

"The upheaval of the bottom of a considerable sea, not greater in area or height than many upheavals in which geologists believe, might have propelled gigantic waves of translation across a large segment of the earth's surface with sufficient violence to produce all the phenomena of the boulders of the Drift for which ice-action cannot account."

THREE SUCCESSFUL HISTORICAL NOVELISTS.

A valuable essay on "History and Fable" traces the interworking of the two factors from remote antiquity to the present day. They began in the myth, with a common fund of legends, traditions and wondrous tales. Then came the effort to distinguish them. In the Middle Ages the partnership was undivided and unlimited. Defoe's was the last case of confusion, unconscious or intentional, between history and fable. "But though history now disowns fable, fable clings persistently to her inveterate connection with history." The historical romance which followed, reaching its high-water mark in Scott, and its last ebb in G. P. R. James, was "something like an artificial myth;" but the facts can now be distinguished from the fable. Finally "the romance has by this time fairly become the novel—a tale of real life, adjusted to the actual ordinary train of human events. Such work can only be produced by artists of the first order; and consequently, we find that only three writers of our own day have attempted it with indisputable success."

Thackeray's "Esmond," George Eliot's "Romola," and Shorthouse's "John Inglesant."

THE ECONOMIC REVIEW.

THERE is a great deal of solid and suggestive reading in this *Economic Review* (London), of the kind prized by social reformers who aim at deriving their principles from the Christian religion. Solemn inquest on the coal war is held by Rev. Prebendary Grier and Mr. James Chadburn. Both agree in charging the masters with the initial blunder of confusing the public mind on the actual percentage of reduction demanded. Neither defends the men throughout. Mr. Chadburn holds that henceforth "just as the royalty owner has behind him the majesty of law, and can command the penalties of a court of justice to enforce *his* living wage, so the miner has the majesty of public opinion, and the high court of an enlightened national conscience with *its* penalties to enforce his claim." He believes that "the lock out has slain ruinous competition," has fixed the order of precedence on "the bed-rock of right—first, labor; second, capital; third, the consumer—and has asserted the dignity and solidarity of labor."

ECONOMISTS AS MISCHIEF-MAKERS.

Professor W. Cunningham inveighs against "Economists as Mischief-makers." The fixing of a living wage by public authority was abolished in 1813, and the apprenticeship system in 1814, in deference to the abstract *laissez faire* principles of the economists, and similar principles favored the laws against combination passed in 1799 and 1800. He exonerates the employers of the war period (1795–1815) from the charge of guilt or carelessness in regard to the sufferings of their employees. He has looked for proof, but found none. Sir Robert Peel, himself a factory owner, carried through measures in 1802 and 1816 for improving the condition of factory apprentices. Dr. Cunningham sees a great change for the worse in the employers' attitude and language in 1824 and 1833. Then *laissez faire* economics and anti-combination laws had wrought their pernicious effects.

OTHER ARTICLES.

Mr. Robert Halstead, writing from a workman's point of view on the stress of competition, shows a spirit of impartiality such as might surprise many employers. He touches a point of great hopefulness when he observes that workmen possessing wide intelligence and organizing skill, who in the old days simply became capitalists themselves and left the forces of labor impoverished, now remain as labor leaders.

Mr. J. Wells gives the results of sixty sets of answers received to inquiries on the conduct of workingmen's clubs, chiefly under Anglican auspices.

THE WOMAN AT HOME.

THE chief feature of the *Woman at Home* is the illustrated paper by Miss Mary Spencer-Warren upon Queen Victoria, which, however, contains nothing particularly new or striking. Another paper of a personal character is that upon Mr. Robert Louis Stevenson's home in Samoa, also freely illustrated, the fiction being supplied by Miss Annie S. Swan, the editress, herself, and Mr. Baring Gould. An interesting feature is a page from a confession album, by Miss Edna Lyall. The quality she most admires in man is unselfishness; in woman, courage; her favorite occupation is writing novels; her favorite pastime the theatre; the rose is the flower she most admires; Ireland is her favorite holiday resort and Robert Browning and his wife her favorite poets.

HARPER'S.

MR. FREDERIC REMINGTON has a Western travel sketch full of charming illustrations, which he calls "In the Sierra Madre with the Punchers." He gives a graphic account of the audacity and dexterity of the "cow punchers:"

"I strolled out to the corrals to see the bulls 'gentled.' After a lot of riding and yelling they were herded and dragged into the enclosure, where they huddled while seven punchers sat on their ponies at the gate. I was standing at one corner of the corral, near the men, when out from the midst of the steers walked a big black bull, which raised its head and gazed directly at me. The bull had never before in his stupid life observed a man on foot, and I comprehended immediately what he would do next, so I 'let out' for the casa at a rate of speed which the boys afterwards never grew weary of commending. No spangled *torero* of the bull-ring ever put more heart and soul into his running than did I in my great coat and long hunting-spurs. The bull made a 'fo'lorn hope' for the gate, and the gallant punchers melted away before the charge.

"The diversion of the punchers made the retreat of the infantry possible, and from an intrenched position I saw the bulls tear over the hill, with the punchers 'rolling their tails' behind. After an hour of swearing and hauling and bellowing, the six cattle were lugged back to the pen, and the bars put up. The punchers came around to congratulate me on my rapid recovery from a sprained ankle, when they happened to observe the cattle again scouring off for the open country. Then there was a grunting of ponies as the spurs went in, some hoarse oaths, and for a third time they tore away after the 'gentle work-oxen.' The steers had taken the bars in their stride. Another hour's chase, and this time the animals were thrown down, trussed up like turkeys for the baking, and tied to posts, where they lay to kick and bellow the night through in impotent rage. The punchers coiled their ropes, lit their cigarettes, and rode off in the gathering gloom. The morning following the steers were let up, and, though wet and chilled, they still roared defiance. For agricultural purposes a Mexican 'stag' would be as valuable as a rhinoceros or a Bengal tiger, and I await with interest the report of the death rate at the Casa Camadra during spring ploughing.

"In the handling of these savage animals the punchers are brave to recklessness, but this is partly because it seems so. In reality they have a thorough knowledge of bull nature, and can tell when and where he is going to strike as quickly as a boxer who knows by the 'skim on the eye' of his opponent. But still they go boldly into the corral with the maddened brutes, seeming to pay no heed to the imminent possibilities of a trip to the moon. They toss their ropes and catch the bull's feet, they skillfully avoid his rush, and in a spirit of bravado they touch the horns, pat him on the back or twist his tail."

THE PRESENT DAY AUTHOR'S TEMPTATION.

Mr. Charles Dudley Warner regrets in the "Editor's Study" the dangers to which a prosperous period of authorship is subjecting authors. He thinks that while necessity is a legitimate and valuable stimulus to work, there is a great temptation in these days of syndicates to write down to one's audience.

"There are living writers," he says, "who have been demoralized to overproduction by this temptation. They have reduced authorship to a trade. It is not simply that they 'pad,' in the technical term of the craft, but they

attempt to draw from un replenished reservoirs. And there is another evil of our prosperous literary era. Hosts of men and women are attracted to literature as an occupation to make money when they have no call to it. Many of them succeed with a public that has no more discrimination in literature than it has in art. In both cases—that of the good writers who are demoralized and of those who have no 'call'—literature suffers. The remark of a magazine editor that the quality of MSS. offered has recently deteriorated is suggestive and alarming."

THE CENTURY.

THE February *Century* is a very excellent number, containing a half dozen articles of especial interest. We quote from that on "Alma-Tadema," by Ellen Gosse; from "The Tramp at Home," by Josiah Flynt; "Nicola Tesla," by T. C. Martin, and "The Real Stonewall Jackson," by Gen. D. H. Hill.

LINCOLN'S PLACE IN HISTORY.

John Coleman Adams writes on "Lincoln's Place in History," and entirely divorces the great President's claim to greatness from the part he played in destroying slavery, affirming that Lincoln will be remembered through the ages as the preserver of the Union. And he is inclined to agree with Mr. Lowell's courageous assertion that the War President might be compared not only with our men of note, but with the great names of the "true elder race." Mr. Adams considers that "the personality of Abraham Lincoln ranks him easily as the greatest of Americans since Washington; and it is by no means a heresy to the rising thought of the age to see in Lincoln and in Ralph Waldo Emerson types of American greatness more thoroughly our own than even that of Washington."

NURSING WEAK FLAMES OF TALENT.

An editorial writer, presumably Mr. Gilder, has something new to say as to the ever-present difference of opinion between the editor and the "unknown author." Generally editors confine themselves to stating—and frequently proving—that the unknown author's accusation of inattention and neglect is unwise and unjust; but the *Century* writer goes farther than this and says that the unknown author *has* received the attention of long hours of study in the sanctum, but that, as a matter of fact, it is very doubtful whether he ever observed it at all.

"Has any editor ever carefully set to work to inquire into the consequences of too much editorial attention to unknown writers in the direction of wasted energies,—both of editors and contributors,—of false hopes, of injured careers? How many literary beggars-on-horseback have been started out in life by this means? How many men and women have been deflected from the natural, home-keeping exercise of their faculties, and have been propelled along paths of failure and disappointment—perhaps even of public injury?

"Furthermore, has any editor ever endeavored to ascertain what is the general effect upon literature of the modern feverish editorial quest for unknown and evasive 'genius,' resulting, as it so constantly does, in the public introduction of the hopeless amateur rather than of the artist by conviction? Does the multiplicity of names brought to the public attention lessen the impression upon that public of the small number that truly stand for art? Nowadays many can once or twice rise to a certain pitch of excellence—not very high, but sufficiently high for publication—perhaps never again reaching the same plane. The conscientious editor is alert for quality from

whatever source ; the names of contributors are legion ; and because of all this miscellaneous scramble is not the man whose talent is strong and steady—who is bound upon a career and not upon an excursion—is he not less distinguished in the great mass of producers ; has he not really less room and less public attention than should be his ? ”

SCRIBNER'S.

WE quote at length in another department from Joel Chandler Harris' two papers on the "Sea Island Hurricanes."

The magazine opens with a capital article by Cosmo Monkhouse on the poet artist, Edward Burne-Jones. He tells us that there was a decided deficiency of careful training and education in the great Pre-Raphaelite's early experience, but by forced drudgery and the most strenuous efforts—which do not seem to have blunted that fine sense of decorative beauty which he possesses—Burne-Jones acquainted himself with the subtleties of draughtsmanship. Concerning his popularity in England, Mr. Monkhouse says :

"In England he is widely known and greatly honored, and the recent exhibition of his works at the New Gallery was a triumph such as only is allowed to few artists in their lifetime. A low, perhaps, but sound test of his appreciation by his countrymen is the large prices which his works fetch whenever they appear in a public auction-room. At the Leyland and Graham sales the large 'Mirror of Venus,' the 'Beguiling of Merlin,' and 'Le Chant d'Amour' were sold at sums ranging between three and four thousand pounds, and the 'Laus Veneris' would not be parted with by its present owner for a much larger sum, if for any. It is a general theme for regret that Burne-Jones has not received the highest honors of the Royal Academy."

THE RAGE FOR ORCHIDS.

W. A. Styles has an unusual paper on orchids, describing, among pretty illustrations, the various rare species of these flowers :

"Fifty years ago, these plants were hardly known except to students of botany, and now the species in cultivation number something like two thousand, with countless varieties and subvarieties, while collectors are exploring every accessible jungle and forest of the tropics for novelties, and under the hands of expert hybridizers new forms are appearing with a rapidity which baffles every attempt to keep a record of them. Admiration for them has become the fashion, and their cultivation has become a passion. Some of them are still rare and costly as diamonds; others, which were once quite as precious, are now displayed in every florist's window. The literature of cultivated orchids would already make a large library, and there are journals in several languages devoted to them exclusively, most of them illustrated with pictures drawn and colored with consummate skill. Millions of dollars are invested in them, and the money value of a single private collection in this country is at least a quarter of a million dollars, while the plants in one commercial establishment are worth still more. Of course, the prices which individual specimens command bear no relation to their beauty when judged by the ordinary canons of taste, and a plant which brings a thousand dollars at auction may differ so slightly from varieties that are sold by the dozen for the production of market flowers that only the trained eye of the connoisseur can detect the peculiarities of habit and form, or can appreciate the purity of color, or the richness of marking, which makes it unique or rare."

M'CLURE'S MAGAZINE.

WE quote in another department from the character sketch of Philip D. Armour, by Arthur Warren, and from Hamlin Garland's "Real Conversation" with James Whitcomb Riley.

Edward Wakefield's paper on "Nervousness: the National Disease of America" is made up of an interview with the famous Dr. Weir Mitchell of Philadelphia.

"Doctor Mitchell considers it proved beyond any dispute that nervousness is the characteristic malady of the American nation, growing upon them in a frightfully accelerated ratio every year, and threatening them with disasters at no distant date which the mind shrinks from contemplating. The number of deaths from this cause is already appalling, and is steadily and rapidly increasing. In some of the busy centres the tables of mortality show that the proportion of nerve deaths has multiplied more than twenty times in the last forty years, and that now the nerve deaths number more than one-fourth of all the deaths recorded. What is most shocking in these returns, this fearful loss of life occurs mainly among young people of both sexes. This means that the Americans are fast becoming a very short-lived people ; and that, if they were shut in on themselves for only a few years, without any influx of vitality by immigration, the publication of the census would send a pang of horror and alarm throughout the land.

"What is the cause of this ? Doctor Mitchell is clearly of opinion that the first and most potent cause is the climate. How or why the climate of America produces the effects that it does has never been explained. Doctor Mitchell says the operation of climatic conditions in relation to health in this country is utterly mysterious ; but he is quite persuaded that the development of a nervous temperament is one of the race changes which are also giving the Americans facial, vocal and other peculiarities derived from none of their ancestral stocks."

Ida M. Tarbell writes on the striking subject of "The Observatory on Top of Mt. Blanc." Of M. Janssen's daring astronomical work here she says :

"To resist the storms he decided to give the house the shape of a quadrangular, truncated pyramid, and to bury three-fourths of the lower story in the snow. This form would give a considerable base ; all the surrounding snow would tend to hold it in place, and the inclination of the exposed walls would 'shed' the wind and diminish its effects.

"The structure was prepared at Meudon under M. Janssen's eyes. It is two stories high, with a terrace. The rectangular base is about thirty-three feet long by fifteen feet wide. A spiral staircase runs the height of the building and unites the two stories and the terrace, which is raised several feet and supports a platform intended for meteorological observations. The walls, windows and doors are double. Care was taken to knit the parts of the structure in such a way that the whole would be rigid, and would support putting back into place in case a movement of the snow carried it out. Particular attention was given also to make the structure light, as well as rigid, in order to lessen the difficulty of mounting it to the top.

"In 1892 the observatory was shipped to Chamouni. All told it weighed about fifteen tons, and, when put up in loads which could be carried on a man's back, it was found that there were seven or eight hundred of them. During the summer of 1892 the workmen succeeded in getting a quarter of this material to the Grand Rocher Rouge, three thousand feet below the summit, and the rest to the Grands Mulets."

THE COSMOPOLITAN.

IN a graphic and stirring naval article, James Creelman writes about an imaginary duello between two modern ironclads, in which the *coup de grâce* is given to the defeated vessel in the Brazilian waters with a shell which explodes a quarter of a ton of dynamite under the boilers of the doomed ship. The pictures of the great fight are quite up to the lurid action of the text.

There is a unique interest in the article by Elaine Goodale Eastman, the wife of Dr. Eastman of the Sioux nation, on "Indian Wars and Warriors," in which she tells of the picturesque and fierce customs of the red men when on the war-path. This is how the Indian father trained his boys for the duties and perils of life:

"Youths who had never before been upon the war-path were compelled to undergo a rude sort of initiation while on the road. They were obliged to fetch wood and water to the camp and to do all the drudgery. If the night was dark and the woods presumably full of enemies, the water might be poured on the ground when brought, and the young men sent for more, in order to test their bravery. From thirty to fifty miles was considered a day's march and if any novice became exhausted and fell behind he would be urged on with ridicule and perhaps even with blows, by a self-constituted police. Frequently an ambitious warrior would arouse his companions in the dead of night, and without stopping for food the party proceeded on a run. Then the poor boy must bestir himself and stumble along, half blind with sleep, lest he be distanced altogether. It was not an easy life by any means; but the privilege of wearing an eagle feather on his return was compensation enough for all!"

The February number of the *Cosmopolitan* is one of the best that that magazine has ever put forth. Its literary feature is the first installment of a novel by the great Spanish writer, Valdés, which he calls "The Origin of Thought," and which is, we believe, the first of his works that has appeared in any of our magazines.

THE ATLANTIC MONTHLY.

WE review at length the article by J. C. Merwin on "Tammany Hall."

Mr. J. C. Bancroft Davis in his paper on Hamilton Fish characterizes the latter as an uniquely able executive officer:

"Mr. Fish had no superior as an executive officer. His great ability made itself felt in every room and at every desk. He knew every clerk personally, and seemed to find out instinctively their habits and ways of life,—whether they were prompt or dilatory, attentive to work or disposed to shirk it. While firm in his requirements, he was just to all under him, and patient in listening to their grievances. He was rewarded by their confidence and respect,—perhaps it is not too much to say, by their affection.

"When he could induce Congress to make the necessary appropriation, he reorganized the Department of State, bringing men to the fore whose minds and hearts were in their work. Over seven hundred volumes, made up from loose and unindexed miscellaneous correspondence, were then brought together, indexed, and bound. Simultaneously with this he introduced in the department, for the first time, a system of general indexing, which, as improved by experience, now enables the clerks to find papers without unreasonable delay."

Mr. B. J. Lang touches on an interesting theme in his essay "From Literature to Music," in the analytic suggestion he makes of the value which Wagnerian music has for the purely imaginative mind.

"It would seem that for us of this period Richard Wagner has opened up a mission for music whereby it more closely allies itself to the romantic in literature, and is less fixed in its own paths of independent absolute form. It is generally conceded that music, to be true to itself, should be the logical development of well-conceived themes, as well worked out and as shapefully and consistently interwoven as the materials used by an architect for an edifice. This might be in the construction of a song or a symphony, the duet in an opera or the chorus in an oratorio. Although Wagner has turned away from rigid forms, and worked on lines that almost deny his music the right to stand quite alone, may he not, unwittingly, perhaps, and in the simplicity of his greatness, have hit upon a helpful path for those who have failed to recognize music as easily and naturally as others,—a path which leads the rather literary or the purely imaginative mind into a comprehension of what it might otherwise have missed?"

THE CHAUTAUQUAN.

"VILLAGE Life in Switzerland," continuing the series of articles in this magazine on the aspects of life among the European peasants, forms the opening paper of the current number. It is profusely illustrated by excellent photographs. "The village scheme of life corresponds to two strong tendencies of the Swiss nature: love of economy and of the companionship of fellow-being. The Switzer's whole existence is ordered accordingly, his house, his dress, his occupations (modified considerably by the nature of the country), his manners and customs. In the same line of a sequence of papers on the great sciences, is Serviss' answer to the question, "What is Astronomy?" The prime object of the study of the heavens is the same now as it has always been, to learn everything possible concerning the invisible universe. Our methods only have been improved. Physics and chemistry have been called to the aid of mathematics. The science is divided into two great branches, the first being the result of the discoveries of Copernicus, of Newton and of Kepler, and "enabling us to untangle the maze of motions" among the heavenly bodies; the second more modern, dating from Galileo's first use of the telescope in 1610, concerned with their constitution and nature. In the latter division spectrum analysis and photography are the modern means by which

"From all quarters Heaven speaks to Man."

There is food for much thought, Protestant as well as Catholic, in the Rev. John Conway's exposition of his and the Roman Church's view of "What Makes a Catholic." In "A Conversation with a Labor Leader," we have a plain statement of the labor problem from the practical standpoint of a man "who had no set of theories to disclaim and uttered his belief with a confidence born of actual experience."

"How Not to Help the Poor," by J. H. Finley, will be found reviewed among the leading articles.

HAVING no longer the attraction of Sherlock Holmes, the *Strand Magazine* is lucky in having still Mrs. Meade's series, "Stories from the Diary of a Doctor," to please lovers of the sensational. Certainly in this respect her latest story "The Horror of Studley Grange," makes the most exciting reading. Miss Mary Spencer-Warren's article on the Queen of Holland, profusely illustrated from photographs of the royal palaces of Amsterdam and the Hague, at least will please those to whom the private life of kings and queens is a source of never failing interest.

THE FRENCH REVIEWS.

THE REVUE DES DEUX MONDES.

IN addition to Ernest Renan's posthumous article, noticed elsewhere, the most interesting article in the January 1 number of the *Revue des Deux Mondes* is the critical and biographical study of Jonas Lie, the Scandinavian novelist, Björnson's well-known rival, and author of "The Clairvoyant," "The Pilot and His Wife," and "Rutland." Jonas Lie, says M. Bigeon, the writer of the article, was born in Finland, and came of a well-known legal family; he is now just sixty years of age, but hearty and vigorous, and devoted to the sea, for as a lad his one dream was to enter the navy, but owing to his extreme short sight this wish was denied him. He became a barrister at the age of twenty-five, marrying shortly after a cousin of his own, a lady who has always remained his closest confidant and dearest friend. Years passed by, and of those round him none realized the poet-writer in their midst; he was already thirty-six years of age when the publication of his novel, "Le Clairvoyant," ("Den Fremsynte") made him famous. Like another great Northern writer, Lie has striven to be both a novelist and a moral reformer, for his works rival those of Ibsen in their plain speaking and cruel analysis of human life. "Lie has been compared to Balzac," observes M. Bigeon; "is he not rather the Scandinavian Daudet and Dickens?" Since the year 1886 he has attempted a somewhat new style of composition, plunging into the world of fairy and folklore tales.

The *Revue des Deux Mondes* for January 15 opens with an account of some archæological travels undertaken in Algiers and Tunis by M. Boissier. He says among other things that "the conditions and resources of the great French colony across the Mediterranean tend to become more and more interesting, owing to the difficulty which France herself is beginning to experience in the lowered price of corn." Algiers was once the "granary of Europe," but when it passed under the domination of the French, the great plain of the Metija had wholly fallen out of cultivation and under the influence of malaria. He has seen a hundred men in hospital at Algiers afflicted with frightful boils, poisoned by exhalations from the once fertile soil.

Under the title "Anachronisms in Art," M. de la Sizeraine endeavors to describe some of the attempts lately made to bring the personality of Jesus Christ into touch with the life of to-day. "All the world," observes the writer, "remembers having seen on the walls of the Second Salon of 1891 a large picture showing the sinful woman in the ball dress, prostrate at the feet of Christ, while the Pharisees who stand near are portraits of Parisian notabilities; the scene takes place in a café. . . . Another painting showed the Son of Man passing from village to village, whence the sick are brought out for Him to heal, while the official doctor looks on with displeasure. Last year—1893—the same idea was made use of even more conspicuously, one painter placing our Lord upon the terrace of the Tuilleries catechising the children who had all played truant from the primary schools; while another portrayed Christ breaking bread before some amazed laborers, not at Emmaus, but on an old French farm. In a second replica of the same thought those present are a Parisian family." A very notable picture of the Crucifixion represents it as taking place on the heights of Montmartre; the poorest of the poor are gathered round the Cross, and a workman in a blouse

shakes his fist at the city which allowed the Just One to be put to death. Nor is this all. Jesus is claimed by the Continental Socialists as their precursor. He is the Carpenter's Son and the Fisherman; He dwells in poverty with the poor.

THE NOUVELLE REVUE.

THE *Nouvelle Revue* of January 1 opens with a short two-page article by Pierre Loti. It is dated from Hendaye, a corner of France which abuts upon Spain opposite to St. Sebastian, and where Loti now spends each winter. It is a delicate and pathetic bit of description of the Basque country and of Fontarabia, with its church and castle mirrored in the slow waters of the Bidasson. In the still air of November, Loti watches the women and the young girls, in black gowns, and lace mantillas drawn across their brows, going from church to church to pray for the living and the dead. And it seems to Loti that he is conscious of the soul of the Basque land—a dying soul. Then, behind and below the little terrace on which he is sitting, "something ugly, black, noisy, and in an idiotic hurry, rushes by, shaking the earth and troubling the delicious calm of silence with whistling and jarring." It is the railway, a greater leveler than time, bringing "showy industry, and modern ideas, and daily strewing the land with common things and imbecile creatures." These two pages are a complete prose poem in their way. Their philosophy is none of the cheer-fullest!

Passing by several interesting articles, including an account of Pope Pius the Seventh at Savona, in the year 1800, under the masterful hand of Napoleon, and a paper on the foreign policy of the Republic of 1848, we come to a long and powerful paper by M. Paul Bourely on "The Moral Evolution of To-day." It is a vigorous onslaught on pessimism, and the latter's present malady of self-indulgence. Still M. Bourely thinks that the tide is turning, although among those ancients whom he quotes as having declared they found life an evil are Buddha, Job, Solomon, Aristotle, Cæsar and Leopardi, while among more modern men, Flaubert, de Musset, Amiel and the de Goncourts would all have given a negative answer to the question, "Is life worth living?"

In the *Nouvelle Revue* of January 15 M. Scheffer begins a thinly disguised historical study under the title of "The Idyll of a Prince," in which is told, with more or less detail, the love affairs of the Prince of Roumania and Mademoiselle Vacaresco.

To those who care for contemporary French literature, the most interesting article in the number will undoubtedly be that contributed by M. Albalat on the development of French fiction since the death of Sainte-Beuve, the critic. This writer all through the years of the Second Empire held a unique place in Europe. Intimate with Princess Mathilde Bonaparte, he was also a favorite of the Empress Eugénie and a frequent guest at the Tuilleries. Those who wish to know something of Continental literature should read his famous "Causeries de Lundi," a collection of reviews and essays which have lost none of their freshness, and which, though neither profound nor intricate, are models of writing from every point of view; for their author, if he sought no peps, always grasped the essential facts of a character or story, and told it in language which his readers could neither misunderstand nor forget.

THE NEW BOOKS.

RECENT AMERICAN PUBLICATIONS.

HISTORY AND BIOGRAPHY.

The Life and Correspondence of Arthur Penrhyn Stanley, Late Dean of Westminster. By Rowland E. Prothero, M.A. Two vols., Octavo, pp. 562-608. New York: Charles Scribner's Sons. \$8.

To a great many intelligent American readers these two large volumes will rank among the most important issues of the spring season. It has been nearly fourteen years since Dean Stanley died, and for more than ten years the labors of compilation, arrangement and authorship which result in this biography have been prosecuted. Mr. Prothero was not the originator of the work, but in the completion of the volumes he has added his own efforts to those of worthy predecessors. From 1887 to 1891 the biography was in the hands of Stanley's successor at Westminster, the Very Reverend G. G. Bradley, D.D., and when circumstances obliged him to relinquish the direct supervision, he still continued to give his co-operation and sanction. The public career of Dean Stanley from ordination to his death covers a period of more than forty years. Aside from the interest one has in him as a remarkable and attractive personality, the record of his life is of great value in connection with many large movements of our century, especially, of course, in the domain of theological discussion. It seems that Stanley was habitually an energetic and liberal correspondent; letter-writing was "one of his most characteristic features," and to that fact these volumes are happily and largely indebted. The frontispiece of Volume I is an exceedingly expressive portrait of the Dean, taken in advanced years, and the other eight illustrations are carefully chosen and well executed. Seven or eight pages are given to a list of Stanley's publications, and the work is thoroughly indexed at the close of the second volume.

The Writings of Thomas Paine. Collected and edited by Moncure Daniel Conway. Vol. I. 1774-1779. Octavo, pp. 453. New York: G. P. Putnam's Sons. \$2.50.

In view of a growing interest in the life and works of Thomas Paine, Messrs. G. P. Putnam's Sons have undertaken the publication of a new, full and critical edition of his writings, to be completed in four volumes, chronologically arranged. The task of editorial supervision has been placed in the hands of Mr. Moncure D. Conway, who has already given to the public a "Life of Thomas Paine." Volume I of the "Writings" has appeared, and covers the period from 1774 to 1779, during which were produced the world famous "Common Sense," and the several numbers (13) of "The Crisis." The volume is in the best style for library service, and its successors will be eagerly awaited by the intelligent student of Paine and of American history.

Famous Adventures and Prison Escapes of the Civil War. 12mo, pp. 348. New York: The Century Company. \$2.

The articles which have been collected to form this admirable volume are the "War Diary of a Union Woman in the South," "The Locomotive Chase in Georgia," Mosby's "Partizan Rangers," "A Romance of Morgan's Rough Riders," "Colonel Rose's Tunnel at Libby Prison," "A Hard Road to Travel Out of Dixie," and the "Escape of General Breckinridge." This series of thrilling episodes, which appeals in some way or another to most wide-awake American citizens, is illustrated by between thirty and forty spirited pictures. The publishers have aimed to make the book worthy of wide popular circulation in price and external make-up, as well as in contents. It is a rich volume for the family circle.

General Scott. By Gen. Marcus J. Wright. "Great Commanders" Series. 12mo, pp. 361. New York: D. Appleton & Co. \$1.50.

The latest volume in the "Great Commanders" Series is written by General Marcus J. Wright, and tells the story of Winfield Scott. General Scott's military career is particularly interesting in that it covered so long a period, bringing him into most prominent service in the War of 1812 and the Mexican War, and allowing him some participation in the early events of the civil war. The volume contains a striking portrait of the veteran General and maps of the most important of his military operations.

The Christian Recovery of Spain. By Henry Edward Watts. 12mo, pp. 342. New York: G. P. Putnam's Sons. \$1.50.

The most recent issue in the extended "Story of the Nations" Series is not of so popular a nature as some of its predecessors, but it treats a subject which is important to the student of Spanish history. The object of the volume is to give a "sketch of the process by which the Spanish nation was formed." This has been accomplished by an examination of the Christian and Arabic authorities bearing upon the period from the Moorish invasion in the eighth century to the conquest of Granada in 1492. A map is furnished which shows the political divisions of Spain and Portugal in 910, and the portraits and other illustrations of the volume are numerous.

The Home Life of the Ancient Greeks. Translated from the German of H. Blümner, by Alice Zimmern. 12mo, pp. 563. New York: Cassell Publishing Company. \$2.

Miss Alice Zimmern, late scholar of Girton College, Cambridge, England, has retained in her translation from Blümner the large number of important illustrations which accompanied the original German text. The work is an exceedingly interesting one from the popular point of view, and gives the reader insight into the "Costume," "Education," "Daily Life," "Gymnastics," "Religious Worship," "Public Festivals," etc., etc., of the Ancient Greeks, or more strictly of the Athenians of the period from the sixth to the fourth centuries B. C. Intelligent readers, old and young, will find a very pleasant form of instruction in these chapters.

History of Education in Delaware. By Lyman P. Powell. Paper, 12mo, pp. 182. Washington: Bureau of Education.

Mr. Powell, who is at present fellow in the Wharton School of Finance and Economy in the University of Pennsylvania, was born in Delaware, and in preparing his monograph he has had the advantage of long residence in the State and an acquaintance with many of her prominent citizens. His paper is conceived and executed in the best modern methods of historical study, and rests upon painstaking research. Not only the public school system, but the collegiate and semi-ecclesiastical aspects of education have received attention. Illustrations of a number of buildings are added to the text. Mr. Powell's paper is No. XV of the "Contributions to American Educational History," edited by Prof. Herbert T. Adams, of the Johns Hopkins University.

The Indian and the Pioneer. An Historical Study. By Rose N. Yawger. Octavo, pp. 332. Syracuse: C. W. Bardeen. \$3.

Miss Yawger is a resident of one of the interior towns of New York State, near Lake Cayuga. She has issued a volume of short studies bearing upon phases of the early Indian life of that region as she has found it from examination of relics, of early historians, etc. Another volume traces some threads of local village history in the same region, noting especially the educational and pioneer aspects. These two volumes come to our desk bound together and each is furnished with a considerable number of illustrations. Miss Yawger's particular work is not of wide application, but it is worthy of notice as a good example of what may be done in a quiet way in many regions of the Union in gathering and preserving the materials of local history. In many quarters the value of such efforts has been underestimated.

Ontario's Parliament Buildings; or, A Century of Legislation, 1792-1892. A Historical Sketch. By Frank Yeigh. Octavo, pp. 172. Toronto: Williamson Book Company. \$2.50.

Mr. Yeigh's study is far more than an architectural sketch. It throws light upon many sides of the development of the Province of Ontario and might well serve as an outline history of her political life, though in no sense an elaborate work. Ontario has reason to be proud of the new structure in which her present parliamentary sessions are held and Mr. Yeigh has furnished many illustrations of the building and of its humbler predecessors, together with portraits of some of

the leading men who have figured in the provincial public life.

Autobiographical Sketches and Personal Recollections. By George T. Angell. Paper, Octavo, pp. 165. Boston: American Humane Education Society. 10 cents.

About a decade ago Mr. George T. Angell, whose life has been so intimately connected for nearly a generation with the progress of humane education in America, prepared a brief autobiography. This has been extended to cover the period from 1883 to 1892 and in easy, anecdotal style presents many interesting things about Mr. Angell and his benevolent enterprises.

CIVICS, POLITICS AND ECONOMICS.

The Daily News Almanac and Political Register for 1894. Compiled by George E. Plumbe. Tenth Year. 12mo, pp. 415. Chicago: Daily News Company. 25 cents.

Tribune Almanac and Political Register for 1894. Edward McPherson, Editor. Paper, 12mo, pp. 405. New York: The Tribune Association. 25 cents.

The World Almanac and Encyclopedia, 1894. Paper, pp. 480. New York: The Press Publishing Company. 25 cents.

The custom on the part of our great newspaper organizations of issuing an annual almanac began several decades ago, but within the past few years improvements have been so extensive as practically to create a new era in this particular form of periodical. The American citizen has to-day his choice of several excellent Almanacs, each with its own claims and its own defenders. In any one of them is packed away a surprising amount of well-arranged statistics relating to the events and conditions of the past year, political, astronomical, industrial, religious, educational, recreative, civic, social, agricultural, etc.—an invaluable mass of matter, for various portions of which the average citizen has an almost daily need. In the annuals for 1894 attention has, of course, been given to the Chicago Exposition and to the silver problem.

Comparative Summary and Index of State Legislation in 1893. Paper, Octavo, pp. 154. Albany: University of the State of New York. 20 cents.

This pamphlet, which is issued as a bulletin from the State Library of New York, is extremely valuable to all who desire a ready reference to recent legislation in the several States of the Union. The summary is made under such general heads as "Public Morals," "Labor," "Estates," "Penal and Reformatory," "Agriculture" and the like, and the essential features of the new laws upon these subjects are usually given, in a compressed and clear form. The science of comparative legislation will be furthered by a liberal use of this convenient piece of tabulation.

A Hand Book for Philadelphia Voters. Compiled by Charles A. Brinley. 12mo, pp. 210. Philadelphia: Published by the Author.

Mr. Brinley deserves high praise for the preparation of this convenient hand book, which contains the information which every voter of Philadelphia ought to know and which every intelligent voter in that city is desirous of knowing and has very probably found difficult to obtain. The hand book is particularly noteworthy as an excellent model for some public spirited citizen in our other large municipalities or even in towns of comparatively small population. It is one of the increasing number of evidences that the agitation looking toward a systematic education of the American voter is beginning to bear appreciable fruit.

Primary Elections. A Study of Methods for Improving the Basis of Party Organization. By Daniel S. Remsen. 12mo, pp. 121. New York: G. P. Putnam's Sons. 75 cents.

Mr. Daniel S. Remsen, of the New York Bar, has prepared a "Study of Methods for Improving the Basis of Party Organization," which is given a place in the admirable "Questions of the Day" Series. With a lawyer's penetration Mr. Remsen sees, as intelligent men in all callings are beginning to see, that practically, under the actual conditions of American civic life, the will of the individual voter must find its efficiency in the party primary, if anywhere, and that it is now largely balked there, owing to false or careless methods of party management. Mr. Remsen offers some pertinent and detailed suggestions looking particularly toward a better organization of nomination machinery.

The First Stages of the Tariff Policy of the United States. By William Hill, A.M. Paper, Octavo, pp. 162. Baltimore: American Economic Association. \$1.

Among recent publications of the "American Economic Association" is a study of the earliest tariff history of the United States, by Mr. William Hill, now tutor in political economy in the University of Chicago. Mr. Hill gives detailed and systematic examination to the "tonnage duties," "tobacco tax," "slave duty," etc., etc., from the earliest colonial times down to the act of 1789, and quotes the opinion of a number of our ante-constitution statesmen, all of whom "favored free trade until 1785." The author finds satisfactory proof that in the passage of the act of 1789, which formed the basis for our later tariff system, the motive of "protection" was at least as important as any other.

Boys as They Are Made, and How to Remake Them. By Franklin H. Briggs. Paper, 12mo, pp. 24. Syracuse: C. W. Bardeen. 25 cents.

Mr. Briggs is chief of the department of mental and manual instruction in the State Industrial School at Rochester, N. Y., and his pamphlet contains a paper presented to the Unity Club, of that city. It is anecdotal rather than statistical.

The Union Pacific Railway. A Study in Railway Politics, History and Economics. By John P. Davis, A.M. Octavo, pp. 247. Chicago: S. C. Griggs & Co. \$2.

A careful study of the Union Pacific Railway history from the standpoint of financial legislation and economics would at any time have been important; the study which Mr. John P. Davis now sends out is especially timely in view of the present exigencies of the Pacific system and the problem of adjusting its indebtedness to the national government. Mr. Davis traces the history of this great transcontinental line from the first suggestions of such a road, way back in the thirties, through the struggles incident to the location; gives a chapter each to the Credit Mobilier and the Thurman Act, and offers a conservative plan for the solution of the present crisis. His essay is, of course, of service as a contribution to the railroad question in general.

RELIGION AND ECCLESIASTICAL HISTORY.

The English Church in the Nineteenth Century (1800-1833). By John H. Overton, D.D. Octavo, pp. 358. New York: Longmans, Green & Co. \$4.

The materials for this contribution to ecclesiastical history have been accumulating, the author tells us, for more than twenty years, and the proper condensation and arrangement of the notes upon which the book is based was a task of no small dimensions. Doctor Overton has paid large attention to the biographical elements of his theme and has not failed to consider the broader aspects of the relations of church conditions to theology, education, literature and missionary work. His studies have led him to characterize the first generation of our century as, all in all considered, a period of important progress in English Churchmanship. There are numerous bottom-page references and the index is extended. The work is a scholarly and important one, though it may not possess a scientific rigidity, and the style is lucid and adequate.

The Age and the Church. By J. H. W. Stuckenberg, D.D. 12mo, pp. 367. Hartford, Conn. Student Publishing Company. \$2.

Doctor Stuckenberg, at present pastor of a Protestant church in Berlin, and as such known to many American students in that city, has had excellent opportunities to consider the problem which is the subject of his recently issued work. He has had long residence in the United States and is familiar with ecclesiastical conditions here and abroad. His style is clear and logical, and he deals with the broad aspects of the subject rather than with statistical details. His purpose has been to answer the three questions: "What is the Age? What is its Church? What Ought the Church to be?"

None Like It. A Plea for the Old Sword. By Joseph Parker. 12mo, pp. 271. New York: Fleming H. Revell Company. \$1.25.

Doctor Joseph Parker is prominent among living preachers in the Congregational ranks who are willing to be called conservatives. His visit to America a few years ago will be remembered by many who may not have followed his London pulpit career. "None Like It," is a very vigorous plea, written from the preacher's standpoint, for the value of the Bible as the Word of God. While Doctor Parker is in favor of the most scholarly examination of biblical lore, he is constitu-

tionally no very warm friend of the "Higher criticism." He has some things in particular to say regarding Horton's "Verbum Dei." The volume is presumably of fully as much interest to those who will not find its spirit their own as to those who sympathize with the author's views.

Every-Day Religion ; or, The Common-Sense Teaching of the Bible. By Hannah Whitall Smith. 12mo, pp. 248. New York : Fleming H. Revell Co. \$1.

Mrs. Smith is known to many readers as the author of "The Christian's Secret of a Happy Life." Her new volume is conceived in much the same spirit as the earlier one. It consists of a series of lessons based on Bible readings and directed toward a study, from the standpoint of every-day, practical needs, of such subjects as "Soul Food," "The Meaning of Trouble," "Taking Up the Cross," "The Law of Love," "Temptation" and others of the same nature. Mrs. Smith's thought is calm and eminently biblical.

Christ, the Patron of all True Education, and The Library a Divine Child. By Charles Frederick Hoffman, D.D., New York : E. & J. B. Young & Co.

"Christ, the Patron of all True Education," is the subject of a sermon which the Rev. Charles Frederick Hoffman, rector of All Angels' Church, New York City, delivered before a society of Hobart College ; "The Library a Divine Child" was an address at the laying of the cornerstone of "Hoffman Library," at St. Stephen's College. Each of these forcible addresses treats of the general or special problems of education, as viewed from the religious standpoint. Doctor Hoffman has added to the original papers a large amount of explanatory and illustrative matter. There are furnished a portrait of the author and a view of the "Hoffman Library."

A Daily Manual for Bible Readers. With an Introduction by Rev. J. T. Ward, D.D. 12mo, pp. 142. Baltimore : Chesney & Litz. 75 cents.

The quotation of Doctor Ward's title in full will sufficiently explain the purpose and method of his little manual. It is composed of "a series of references to the sacred text, in historical and chronological order (on the basis of the arrangement of Rev. George Townsend, M.A.) with portions assigned for each day, so as to take the reader through the Old Testament once and the New Testament twice in a year."

Angelus Domini. Edited and Compiled by "A Daughter of the Church." 12mo, pp. 183. New York : The Baker & Taylor Co. \$1.50.

The contents of this volume relate to many phases of the adoration of the Virgin. They consist of brief prose extracts, of a large number of poetical selections from various writers, of many full-page illustrations reproducing great paintings, of a list of the feasts in honor of the Virgin and kindred matter. The compilation seems to be a careful one and the book presents a neat appearance.

Key-Words of the Inner Life. Studies in the Epistle to the Ephesians. By F. B. Meyer, B.A. 12mo, pp. 158. New York : Fleming H. Revell Co. 50 cents.

The various writings of Rev. F. B. Meyer, strongly and directly evangelical, have had a large circulation. His studies in Ephesians, which he conceives as "pre-eminently the epistle of the inner life," bear the same general character as former works.

The Invincible Gospel. By George F. Pentecost, D.D. Paper, 12mo, pp. 52. New York : Fleming H. Revell Co. 25 cents.

An address delivered by Dr. Pentecost before the Parliament of Religions last September.

COLLECTIONS OF HYMNS AND SONGS.

The Plymouth Hymnal. Edited by Lyman Abbott. Octavo, pp. 639. New York : The Outlook Company.

To very many discriminating lovers of noble congregational music in this country it will be a sufficient recommendation of "The Plymouth Hymnal" to state that it is based upon the same general principles as those which dominated the preparation of the "Plymouth Collection" which first came from Mr. Beecher's hands in 1855. The most careful and extended search has been made for the choicest expressions of spiritual experience in music adapted for the singing of entire congregations. Form as well as spirit has been considered of great importance. The resulting hymnal consists of a selection of 638 hymns and 471 tunes. The details of arrangement, the

various indexes, etc., have been very carefully supervised, and the publishing features of the volume could hardly be surpassed.

Our New Hymnal ; for General Use and Special Services. By Philip Phillips and Philip Phillips, Jr. Square 12mo, pp. 369. New York : Funk & Wagnalls Company. \$1.

Philip Phillips, known in nearly all countries as one of the foremost of musical Evangelists, and his son have compiled and edited a collection of hymns which is intended to meet the various wants of Sunday schools, evangelical meetings, missionary gatherings, young people's religious services, etc., etc. Five hundred and thirty hymns are included, representing more than seventy authors and adapted to all denominations of Protestant Evangelicism. There are topical selections for special occasions, with connective Scripture readings, and also a complete concordance index. The volume presents a very neat appearance, and one is gratified to find many old and familiar hymns upon its pages. It would seem to have its own important field.

Songs of the Pentecost for the Forward Gospel Movement. Edited by Charles H. Gabriel and Rev. Isaac Naylor. 12mo, pp. 224. New York : George Hughes & Co. 30 cents.

The style and the general spirit of this song collection follow the model of "Gospel Hymns." The title-page declares it to be "international, interdenominational, adapted to all Christian gatherings, especially to aggressive revival work, camp meetings, conventions . . . and for social worship in the church." A considerable number of the tunes will be new to many singers.

SCIENCE AND PHILOSOPHY.

Science and Hebrew Tradition. Essays by Thomas Huxley. 12mo, pp. 394. New York : D. Appleton & Co. \$1.25.

The eight essays here collected form Volume IV of the now-issuing series of nine volumes. They are mostly addresses or articles of comparatively recent date, ranging from 1880 to 1891, though one New York lecture was given in 1876. The general scope of the essays is sufficiently indicated by the title of the volume. In the few pages of the preface, written last October, Professor Huxley takes occasion to say some pretty severe things about certain "Helps to the Study of the Bible," and also to lay down with emphasis the thesis : "Of infallibility in all shapes, lay or clerical, it is needful to iterate with more than Catonic pertinacity, *Delenda est.*"

The Diseases of Personality. By Th. Ribot. Paper, 12mo, pp. 157. Chicago : Open Court Publishing Company. 25 cents.

A recent addition to the "Religion of Science Library" is a translation of Ribot's (French) treatise on "The Diseases of Personality." It throws a vast amount of light upon some very important conceptions of consciousness and individuality as they are held by the advanced school of workers in experimental psychology. It need hardly be said that certain of these conceptions run counter to traditional views which are still cherished by the majority of people and by many philosophic thinkers.

The Fauna of the Deep Sea. By Sydney J. Hickson, M.A. 12mo, pp. 185. New York : D. Appleton & Co.

This volume is the sixth in the "Modern Science Series," edited by Sir John Lubbock. The subject is naturally one of general interest ; and, while the results of investigations so far into the animal life of the deep sea reveal less startling phenomena than one might suppose, much valuable knowledge has been accumulated. This particular field of research is a comparatively new one, workable only through the aid which the governments of the great modern nations have supplied. Twenty-five illustrations help the reader to an understanding of the text.

A History of Mathematics. By Florian Cajori. 12mo, pp. 436. New York : Macmillan & Co. \$3.50.

Professor Cajori, who at present occupies the chair of physics in Colorado College, has for some time taken a lively interest in the historical side of mathematical knowledge. His new volume is the result of enthusiasm as well as research and covers the field, with a due attention to proportionate treatment, from ancient times down to our day. His belief is that a larger attention to the development of the science of mathematics would enrich for teacher and pupil a study which, as taught by usual methods, becomes repulsive

to many minds. The volume is well indexed and a considerable bibliography is appended.

Maize: A Botanical and Economic Study. By John W. Harshberger, Ph.D. (Univ. of Penna.) Paper, Octavo, pp. 128. Philadelphia: University of Pennsylvania Press. \$1.50.

Doctor Harshberger, of the botanical department of the University of Pennsylvania, in an elaborate monograph upon "Maize," finds the original home of that cereal to have been in Central Mexico. His paper, which treats the subject from the economic as well as the botanical standpoint, contains many statistics and is illustrated by a number of plates.

LEXICOGRAPHY.

A Standard Dictionary of the English Language. Prepared under the Supervision of Isaac K. Funk, D.D. In two vols. Vol. I. Royal Quarto, pp. 1060. New York: Funk & Wagnalls Co. \$20. Single volume edition, \$16.

The most elaborate issue which requires notice this month is Volume I of the "Standard Dictionary" which Messrs. Funk & Wagnalls now throw upon the market after four years of constant and extensive preparation. The history of dictionary-making in itself is highly interesting, not only as showing the development of our language, but as tracing one of the great enterprises in which our modern methods of *organization* and *specialization* show their superiority over the old ways. The work which gave lexicographical fame to Doctor Samuel Johnson contains only some 45,000 words and terms, while the editors of the Standard have found it necessary to record more than six times that number (*i. e.*, nearly 300,000). A very large number (extending into the hundreds) of scholars and specialists have rendered their various services in the work of creating and perfecting the new dictionary, the editorial staff including such names as Professor Francis March, LL.D., who has had charge of the spelling and pronunciation and has filled the office of consulting editor; Hon. T. M. Cooley, LL.D., Hon. Carroll D. Wright, Professor Frederick Starr, Professor R. O. Doremus, Professor Huxley, President Harper, Max Müller, Hubert H. Bancroft, General O. O. Howard, etc., etc. The purpose of the Editor-in-Chief has been to build up from the decisions of authoritative specialists a reliable, modern work which to no small extent would serve the function of encyclopedia as well as dictionary. The details of arrangement cannot be extensively noticed here, but they are in the main excellent and show not a few innovations which aim to make the work eminently modern (*e. g.*, to some extent the "spelling-reform" movement has been recognized and the pronunciation of words has been given in the "Scientific Alphabet" of the American Philological Association) and is eminently serviceable for popular and ready reference. The dictionary has already had warm commendation, and it will certainly take a high rank among the works of its class which are made, not for the scholar and historian of language, but for the average man who wishes to know what our language is to-day in its spelling, definitions, pronunciations, technical terms, idiomatic expressions, etc., etc., as it is used in all portions of the English-speaking world. The varieties of print used in the Standard are clear, the paper is firm, though thin, and the colored plates and numerous wood-cuts are very helpful. The companion and closing Volume II will probably be issued in the course of two or three months. It will also be possible to obtain the dictionary in a one-volume edition.

The Orthoëpist. A Pronouncing Manual. By Alfred Ayres. 16mo, pp. 292. New York: D. Appleton & Co. \$1.

In sending out a new edition of his convenient and widely-circulated manual, Mr. Ayres writes that he has added about a thousand words, collected in the twelve years since the work first appeared, and has made all changes necessary to bring the book into conformity with the most recent and most approved usage. In the present form the manual contains about 4,500 words which are frequently mispronounced.

ESSAYS AND BELLES-LETTRES.

The Ideal of Humanity in Old Times and New. By John Stuart Blackie. 16mo, pp. 201. New York: Fleming H. Revell Company. \$1.

The essays which Professor Blackie has placed together under the common title of "The Ideal of Humanity" are devoted respectively to "David, King of Israel," "Christian Unity," "Wisdom," "Women," "St. Paul and the Epistle to the Romans," and "The Scottish Covenanters." They are all marked by the eminent professor's knowledge, logical habit of mind and obedience to high moral ideas.

Our Intellectual Strength and Weakness. By J. G. Bourinot. Quarto, pp. 111. Montreal: Foster, Brown & Co.

Dr. Bourinot is known as the author of a number of works upon the history and government of Canada. The essay upon "Canada's Intellectual Strength and Weakness" is a brief but able review of the development of literature, art and education in the Dominion, and was originally prepared as a presidential address before the Royal Society of Canada. It is a worthy contribution to our knowledge in a field where information is not, for the most part, easily accessible.

Oliver Wendell Holmes. By Walter Jerrold. 16mo, pp. 144. New York: Macmillan & Co. 90 cents.

Mr. Walter Jerrold's pocket volume upon our venerable poet belongs to the "Dilettante Library," and is necessarily a very slight sketch. It devotes a chapter each to a consideration of Holmes as "Man," "Poet," "Novelist," "Autocrat and Teacher" and "Doctor." An excellent portrait adds much to the companionableness of the work.

FICTION.

The Waverley Novels. By Sir Walter Scott. International Limited Edition. With Introductory Essays and Notes by Andrew Lang. Vols. XXIV, XXV. "The Pirate." Octavo, illustrated. Boston: Estes & Lauriat. \$2.50 each volume.

In his pleasant introduction to the two volumes of "The Pirate," which have now appeared in the admirable "International Limited Edition," Mr. Andrew Lang writes of this story: "It can scarcely be placed in the front rank of Scott's novels, but it has a high and peculiar place in the second and probably will always be among the special favorites of those who, being young, are fortunate enough not to be critical." The introduction gives an interesting account of the way in which Scott's diary notes of travel in 1814 were evolved into the romantic fiction of 1821, and the reader has thereby a glimpse into the secrets of the great novelist's method of composition. The ten etchings of various subjects and treatment which illustrate "The Pirate" are all excellent; some of them are exquisite.

The Greater Glory. A Story of High Life. By Maarten Maartens. 12mo, pp. 484. New York: D. Appleton & Co. \$1.50.

A story by the Dutch novelist, Maarten Maartens, which has recently come to a conclusion in the columns of the *Outlook*, now appears in convenient book form. "The Greater Glory" pictures, with force and understanding, manners and morals in the circles of the nobility of Holland in the modern era. It is a novel of elevation, of distinct literary merit, and is written in a lucid, energetic, almost electrical style. In view of these facts, and considering the little knowledge which most of us possess as to Dutch literature, it is to be presumed that a large public will welcome the story.

A Superfluous Woman. Anonymous. 12mo, pp. 336. New York: Cassell Publishing Company. \$1.

"A Superfluous Woman," published anonymously, is in many ways one of the strongest of the recent novels. It is an English story, discussing somewhat the same problems which formed the core of the "Heavenly Twins." A London society woman, urged by a wise physician friend, escapes for a time to the agricultural regions of Scotland, and then falls in love with a rugged peasant, whom the author takes care to create as nearly perfect as the reader's imagination will endure. The heroine, however, returns to London, leaving her rural lover to a life of misery and finding misery herself in the marriage with a dissolute nobleman. There are readers who will probably consider the story a piece of sickly sentimentalism; there are others who will pardon certain obvious defects, believe in the pathos and be glad of the study of existing social conditions, in which, perhaps, lies the chief value of the book.

Cheap Jack Zita. By S. Baring-Gould. 12mo, pp. 402. New York: J. Selwin Tait & Sons. \$1.25.

"Cheap Jack Zita" is a particularly fresh and vigorous story, with a large element of adventure, introducing the readers to several characters of an unusual type, all belonging to the common people. The scenes are laid before the Cathedral of Ely, England, and in the surrounding region of the "Fens," which fact guarantees that the novel will at least provide something new in the way of "local color" to

American readers. There are several illustrations; one of the cathedral.

Apprentices to Destiny. By Lily A. Long. 12mo, pp. 348. New York: Merrill & Baker. \$1.

One Day. A Tale of the Prairies. By Elbert Hubbard. "Side Pocket" Series. 16mo, pp. 103. Boston: Arena Publishing Co. 75 cents.

Beneath the Dome. By Arnold Clark. 12mo, pp. 361. Chicago: The Schulte Publishing Company. \$1.25.

A Wedding Tangle. By Frances Campbell Sparhawk. 12mo, pp. 341. Boston: Arena Publishing Company. \$1.25.

These four stories are of varying length and of varying degrees of excellence, but they are all eminently American, the first three belonging to the interior and the fourth to the Atlantic coast. Miss Lily A. Long, the author of "A Squire of Low Degree," has written in "Apprentices to Destiny" a realistic story of Mississippi Valley life to-day, which bears upon some social problems and yet has more kinship with the works of "Octave Thanet" than with those of Hamlin Garland. "One Day" is a slight sketch in which the pathetic element is the predominant one. The author has apparently found his model in Mr. Garland. "Beneath the Dome" is published posthumously. Its author, Mr. Arnold Clark, held for a time a clerkship in the office of the Michigan State Board of Health, and the "Dome" of his story is that of the Michigan Capitol. Mr. Clark was a young man, an educated man, who took a large and enthusiastic interest in the "land question" and other social problems, and it is along these lines that the merits of his novel are to be tested, though it has a value merely as a piece of Western realistic fiction. Frances Campbell Sparhawk's "Wedding Tangle" carries us back to the colonial days of the eighteenth century and introduces the episode of Pepperell's successful expedition against Louisburg (Cape Breton) in 1745. The story preserves with a good deal of distinctness the atmosphere of the olden time.

The Strike at Shane's. Sequel to "Black Beauty." Paper, 16mo, pp. 91. Boston: American Humane Education Society. 10 cents.

This little story, which came into being and goes forth to the public under the auspices of the "American Humane Education Society," is a sequel to the famous "Black Beauty." "Shane" is an Indian farmer who is unkind to the various domestic animals of his establishment, and he is brought to a reform through a successful strike on the part of these useful and mistreated creatures. This sort of fiction makes no pretense to artistic rank, but only good can come from a wide circulation, especially among the young, of simple literature which teaches the lesson of kindness and the evil effects upon man himself of cruelty to the animals so largely in his power.

The Isle of Feminine. By Charles Elliot Niswonger. 16mo, pp. 160. Little Rock, Ark.: Published by the Author.

Mr. Niswonger's fancy has created a charming little piece of romantic fiction, which he has written out in a style delicately graceful, transparent and uniting a serious quality with the play of a delightful humor. A disabled boat carries the hero to the "Isle of Feminine," vaguely located in a rich, tropical region, where Diana is at once queen and goddess, ruling in the gorgeous "Palace of Perpetual Life," where her immortal and beautiful maidens are the chief citizens and the few men of the realm are dejected and insignificant slaves. The key to immortal life Diana has found in the rejection of passionate love, but the coming of the stranger soon disturbs the peace of the whole island. The queen herself discovers her love for him, and, in the new consciousness of womanhood, feels a satisfaction unknown in the long centuries of her rule. But she purchases her joy at a terrible price; the island, with all its population, sinks away into the sea, only the hero escaping, with the beautiful maiden Vesta, whose love for the mortal denies all the pleasures which she had known as a princess of Diana's court.

Mr. Wayt's Wife's Sister. By Marion Harland. 12mo, pp. 314. New York: Cassell Publishing Company. \$1.

In addition to "Mr. Wayt's Wife's Sister," Mrs. Terhune's new volume contains two much shorter stories entitled "A Social Success," and "The Articles of Separation." All three of these pieces are lightly-told sketches of contemporary American life in New York City or its neighborhood.

Earth Revisited. By Byron A. Brooks. 12mo, pp. 318. Boston: Arena Publishing Co. \$1.25.

Mr. Brooks has given the public another of the novels which belong to the "Looking Backward" type. The story is written in an autobiographical form and pictures the social, industrial, religious and educational America of 1992. As a work of fiction the volume embodies in a fanciful way a view expressed in the closing words: "To live is to love and to labor. There is no death." The style is clear and direct.

A Chronicle of Small Beer. By John Reid. 12mo, pp. 208. New York: J. Selwin Tait & Sons. \$1.

"A Chronicle of Small Beer" is composed of twenty-eight sketches which show in a more or less connected way the ups and downs of an imaginary English school-boy's life. Here and there is a touch of pathos, and humor is frequent. There are several full-page illustrations.

Fragments in Baskets. By Mrs. W. Boyd Carpenter. 12mo, pp. 223. New York: J. Selwin Tait & Sons. \$1.

This volume contains ten or twelve short pieces in the nature of moralizing allegories. They are written in a helpful and reverent way and in a very quiet tone. Several illustrations accompany the sketches.

The Childhood of an Affinity. By Katharine E. Rand. 12mo, pp. 304. Boston: Arena Publishing Co. \$1.25.

A Bundle of Life. By John Oliver Hobbs. The "Pseudonym" Library. 16mo, pp. 159. New York: J. Selwin Tait & Sons. 50 cents.

Doctor John Sawyer. By Mrs. E. J. Bartlett. "Side Pocket" Series. 16mo, pp. 166. Boston: Arena Publishing Co. 75 cents.

STORIES FOR YOUNG PEOPLE.

Only a Guardroom Dog. By Edith E. Cuthell. 12mo, pp. 223. New York: Cassell Publishing Company. \$1.25.

The hero of these pages is a British Skye terrier, named "Tangle," who has a series of amusing adventures and performs several highly praiseworthy acts during the period of his connection with a certain company of the Loyal Dumfriesshire Regiment. His end is such as befits a soldier of the Queen. Several illustrations accompany the chapters.

"Two." A Story of English Schoolboy Life. By Barry Pain. 12mo, pp. 328. New York: Cassell Publishing Company. \$1.25.

"Two" is illustrated and contains plenty of the movement and exciting occurrences which boys like. The author does not feel called upon to eliminate boyish slang phraseology.

Pansy Stories. By Virge Reese Phelps (Victor Meredith Bell). 16mo, pp. 207. Boston: A. I. Bradley & Co.

There are eight short American stories in this volume, all exceedingly quiet and generally of a semi-religious nature. They are apparently intended for young girls.

The Little Old Man. A Story Written on Request. By Uncle Charley. 16mo, pp. 31. Syracuse: C. W. Bardeen. 50 cents.

Teaches very "little women" that mother's judgment about what is best for them is generally pretty nearly right.

My Book. By Celia P. R. Roswell. At the Age of Eight Years. 16mo, pp. 191. Nashville, Tenn.: Gospel Advocate Pub. Co. \$1.

A childish imagination is evident throughout this book, which a little girl has written (presumably with more or less help from older people), but an imagination which seems to show a good deal of promise, and is not to be despised at its present stage. There are two full-page illustrations.

EDUCATION AND TEXT-BOOKS.

Engineering Education; Being the Proceedings of Section E of the World's Engineering Congress. Edited by DeV. Wood, Ira O. Baker and J. B. Johnson. Octavo, pp. 350. St. Louis: J. B. Johnson. \$2.50.

This volume, in addition to being the record of one of the numerous technical bodies which assembled at Chicago last

year, is "Vol. I of the Proceedings of the Society for the Promotion of Engineering Education." It contains a considerable number of solid and able papers by eminent educators upon the theory and practice of their work, with the discussions which followed. It is another forcible reminder of the remarkable growth of interest in recent years in the thorough and sound preparation for the various branches of the engineering profession. The expansion of technical schools, in America especially, is evidenced in these pages.

Foreigner's Manual of English. The Rational Method for Teaching English to Foreigners. By Helen F. Clark. Octavo. New York: William Beverley Harrison.

This manual has grown out of a teacher's practical experience in the difficulties of initiating foreign pupils into the mysteries of our mother tongue. The various details of the "rational method," as the author calls it, all rest upon the fundamental principles that English should be taught by the use of English, that sentences should be taught from the start, that a vocabulary should be built up of words actually employed in daily life and illustrated by objects, etc., etc. In a word, in principle and motive the "rational method" follows the Gouin system. Many of our teachers, who are confronted day after day by young foreigners of every nationality with the most meagre knowledge, if any, of English, will doubtless be glad to give careful examination to this work, which proposes to help solve a vexing problem.

A First Book in Old English. Grammar, Reader, Notes and Vocabulary. By Albert S. Cook. 12mo, pp. 326. Boston: Ginn & Co. \$1.60.

Among the numerous educational movements of the last few years, a most prominent one is the revival of interest in "Old English," which term has practically superseded the familiar "Anglo-Saxon." Prof. Albert S. Cook, of Yale, is known among teachers as one of our foremost scholars in this branch of learning, and his new "first book" merits and will receive a warm reception. It includes all the apparatus required by a beginner in the complex and at first usually confusing study of Old English, and Professor Cook has given great care to its preparation.

Ekkehard. By Joseph Victor von Scheffel. Edited, with English notes, by Carla Wenckebach. 12mo, pp. 241. Boston: D. C. Heath & Co. 75 cents.

Das Spielmannskind. Der Stumme Ratsherr. By Wilhelm Heinrich Riehl. Edited, with notes, by Abbie Fiske Eaton. Paper, 12mo, pp. 91. Boston: D. C. Heath & Co. 25 cents.

Scheffel's "Ekkehard," an historical novel of the tenth century, has a high place in German prose, but its length has largely unfitted it for school-room use. Prof. Carla Wenckebach, of Wellesley College, has by judicious condensation overcome this difficulty. Her abridgement of the story, with some twenty-five pages of notes, has been given a place in Heath's familiar "Modern Language Series." In the same series appears a little volume edited by Abbie Fiske Eaton, of the Oberlin College German Department, containing two stories by Riehl: "Das Spielmannskind," and "Der Stumme Ratsherr." The first is useful as an example of the author's theory of what an historical tale should be.

Burg Neideck. By Wilhelm Heinrich Riehl. With notes by Charles Bundy Wilson, A.M. Paper, 16mo, pp. 105. Boston: Ginn & Co. 36 cents.

Professor Charles B. Wilson, of the chair of modern languages and literature in the State University of Iowa, has also prepared a "Novelle" by Riehl, which has for its background the Seven Years' War. Professor Wilson's introduction gives at some length Riehl's method and aim in novel writing. The notes fill about twenty pages.

Michel Strogoff. Par Jules Verne. Abridged and edited, with notes, by Edwin Seelye Lewis, Ph.D. 16mo, pp. 229. New York: Henry Holt & Co. 70 cents.

Professor Edwin Seelye Lewis, Ph.D., of Princeton University, has chosen one of Jules Verne's interesting stories and abridged and annotated it for class-room use. The irregular verbs which occur in the text are referred to in the closing pages of the book, where their principal parts are given. This arrangement is intended to facilitate the reading of French on the part of students who have as yet mastered only the

regular verbs. A portrait of Verne is a rather unusual and pleasant addition to a school edition of a foreign text.

Morceaux Choisis d'Alphonse Daudet. Edited and annotated by Frank W. Freeborn. 12mo, pp. 238. Boston: Ginn & Co. 85 cents.

Mr. Frank W. Freeborn, of the Boston Latin School, has brought together a large number of short, choice selections from Daudet, with the approval of the French author, and has annotated them with particular thoroughness. The volume is intended to be of service to young students who have had some months' preparation for reading French.

Laelius. A Dialogue on Friendship. By M. Tullius Cicero. Edited, with notes, by E. S. Schuckburgh, A.M. 16mo, pp. 216. New York: Macmillan & Co. 40 cents.

The text proper occupies only about one-fourth of the space in this little volume, the rest being given to the introduction, copious notes, biographical index and an extensive vocabulary. The American edition, revised and enlarged from the English, has been prepared by Mr. Henry Clark Johnson, president of the Philadelphia Central High School.

First Course in Science. By John F. Woodhull. Two Vols. Vol. I, octavo, pp. 93. 50 cents. Vol. II, 12mo, pp. 148. 65 cents. New York: Henry Holt & Co.

These two volumes embody the results of seven years spent in the study of the proper way in which elementary science should be taught in our public schools. Their author is professor of methods of teaching science in the Teachers' College, New York City. Mr. Woodhull for various reasons believes that it is better to begin with scientific investigation in a comparatively small field: hence these two little books are devoted entirely to the phenomena and laws of light. The first is a book of experiments to direct the pupil in his own research with simple apparatus, while the second fills the function of an ordinary text-book, re-enforcing and clarifying the experimental work. Teachers may not be inclined to agree with Professor Woodhull at every point, but the time and labor which he has given to his problem, an important one in itself, make his ideas worthy of careful examination.

Guide to the Study of Common Plants. An Introduction to Botany. By Volney M. Spaulding. 12mo, pp. 268. Boston: D. C. Heath & Co. 85 cents.

This particular text-book in botany is based entirely upon the laboratory method, and is intended to be a guide to the student in his own first-hand examinations of plant life. Its author is professor of botany in the University of Michigan, and in preparing this work he shows to the sub-collegiate world, with considerable precision, the present tendencies of university instruction in botany and the sort of preparation in the subject which is expected of those seeking admission to the higher courses.

THE WORLD'S FAIR.

The Book of the Fair. By Hubert Howe Bancroft. Complete in 25 parts. Part II. Imperial folio, pp. 40. Chicago: The Bancroft Co. \$1 each part.

Part II of "The Book of the Fair," which is in process of creation in the competent hands of Mr. Hubert Howe Bancroft, includes the completion of Chapter Three, upon the "Evolution of the Columbian Exposition," Chapter Four, which expounds "The Site, the Place and the Artificers," and a portion of Chapter Five, devoted to "Exposition Management, Congress Auxiliary and Finances." The illustrations, which are constituting so valuable an element in the sum total of the undertaking, include in Part II about thirty portraits, ground plan of the exposition, a birds-eye view of the whole, views of separate buildings, scenes in the Midway Plaisance and numerous others. The quality of paper and the typography are of particular excellence.

The World's Congress of Religions. With an introduction by Minot J. Savage. 12mo, pp. 435. Boston: Arena Publishing Company. \$1.25.

Among the various volumes which summarize the proceedings of the great parliament of last September that of the Arena Publishing Company finds its worthy place. The aim has been to present, in popular form and in a book of convenient size, a representative selection of as many addresses as possible, *verbatim*, and without comment.

CONTENTS OF REVIEWS AND MAGAZINES.

AMERICAN AND ENGLISH.

American Amateur Photographer.—New York. January.
To American Photographers. George Davison.
Why do Silver Prints Fade? J. H. Janeway.
Beginner's Column.—III. John Clarke.
Elementary Stereography. Thomas Redding.

American Anthropologist.—Washington. (Quarterly.) January.
